EMINENT SCOTSMEN.

M.

MACADAM, JOHN LOUDON. Since the days of the Appian and Flaminian highways, it has been unusual to convert a great public road into a memorial of its founder by investing it with his name. Cities have been linked together, impassable highways penetrated, and kingdoms themselves converted into thoroughfares, while few have thought of inquiring by whom these facilities were planned, or constructed, or even kept in repair. Was it that, after these matchless road-makers, the Romans, had passed away, they left no successors worth commemorating? This, and the fact that even our best highways were the work not of individuals but communities, not of years but centuries, will explain the universal ignorance. Thus Europe went on for two thousand years, until a startling change occurred. Roads were now *macadamized*, because a new way of constructing them had been adopted; and that new way had been discovered by John Loudon Macadam.

This distinguished father of modern highways was born in the town of Ayr. The precise date of his birth we are unable to assign, but it appears to have been in the year 1756. He was the second son of James Macadam, Esq., of Waterhead, in the stewartry of Kirkcudbright. This family, originally descended from the Macgregors, while the clan was still powerful and unproscribed, held the rank of Scottish barons at Waterhead previous to the accession of James VI. to the English throne; and the name passed into that of Macadam, in compliment to the first baron, whose name was Adam Macgregor. The last of these barons was James Macadam, father of the subject of this memoir, whose ill luck or profuse expenditure occasioned the family estate to pass by purchase into the possession of a younger branch of the original family. The maternal descent of John Loudon Macadam was still more distinguished, as his mother, Miss Cochrane of Waterside, on the banks of the Ayr, was related to the illustrious house of Dundonald. His earliest education was received at the school of Maybole, at that time taught by Mr. Doick; and even already it appears that the planning and construction of roads had attracted his attention. This he evinced by showing to his wondering school companions the model of a section of the Girvan road, extending from Maybole to Kirkoswald, which he had executed during his half-holidays.

In consequence of the impoverished circumstances of his father, and being a younger son, John found that he must begin betimes to shift for himself. He therefore left Scotland for New York, where he had

an uncle, Dr. William Macadam, by whom he was kindly received and adopted as a son. He had only reached the age of fifteen when he was thus thrown upon the world; but he appears to have had his full share of that spirit which carries his countrymen successfully onward. He passed his apprenticeship in a mercantile establishment, and soon after this was finished, he commenced business on his own account, as an agent for the sale of prizes, in which he continued till the close of the revolutionary war, and realized a considerable fortune, besides that which he obtained by his marriage with Miss Nichol, a young lady of great beauty. But the success of the Americans in their war of independence was fatal to his own party, which was that of the royalists; and he experienced, with his brethren in political opinion, the *vac victis* of an unsuccessful cause, in the loss of a considerable part of his property. Still, however, on his return to Scotland he had enough to purchase the estate of Sauchrie in Ayrshire. Here he resided for thirteen years, and held the offices of magistrate and deputy-lieutenant of the county. From Sauchrie he removed to Falmouth in 1798, in consequence of being appointed agent for victualling the navy in the western ports of Great Britain. He afterwards changed his place of residence to Bristol, where he resided many years; and subsequently to Hoddesdon in Hertfordshire.

During these changes of scene and occupation, Mr. Macadam never appears to have lost sight of his early predilections in road-making. It formed the principal subject of his study while acting as one of the trustees upon certain roads in Ayrshire, and afterwards when he had removed to England. It was certainly a bold experiment he proposed in a mode of constructing roads, by which the practice that had prevailed for thousands of years was to be abandoned in favour of a new theory. But it was the proposal of an eminently practical, sagacious, and scientific mind, that had revolved the subject in all its bearings during the period of an ordinary lifetime, and whose days were still to be continued to carry it into execution. A full opportunity for the commencement of his plan occurred in 1815, when he was appointed surveyor-general of the Bristol roads; and after the first trials were made, the result was so satisfactory that the new mode of road-making came into general adoption over the whole kingdom. After the excellence of his method had been sufficiently tested for highways, the fitness of its adoption for streets came next in question; and upon

this subject Mr. Macadam was examined by a committee of the House of Commons in 1823. He then so clearly demonstrated the propriety and advantage of converting the ruble causeway of the principal streets of cities into a smooth pavement, like the country roads he had already constructed, that the change was adopted in London, Edinburgh, Dublin, and our principal towns.

An immense quantity of public labour was thus brought under the superintendence of Mr. Macadam, by which he might have accumulated profits to an indefinite amount, while his character as a public benefactor would have remained untouched. But superior to every selfish consideration, he confined his services to superintendence, and nothing more—for he thought that an engineer should never act as a contractor, because, where the offices are combined, the public was too often the loser that one man might be enriched. It would have been well also if this conscientious generosity had been reciprocated by our government towards such an upright, faithful, and useful servant. But this, we are sorry to add, was not the case. After having advanced many thousands of pounds from his own resources to expedite the works in which he was engaged for the public benefit, he received in compensation from government only £10,000, in two instalments—a most inadequate return for his services, independently of his outlays. He thus might be said to have been rewarded with less than nothing. The honour of knighthood, indeed, was offered to him; but this, on account of his growing infirmities, he declined in favour of his son, the late Sir James Macadam, who prosecuted his father's profession, with the superintendence of the roads around London.

During the latter part of his life Mr. Macadam resided chiefly in the British metropolis, where he was greatly esteemed by the literary and scientific society with which he was surrounded, on account of his conversational powers and varied accomplishments. He finally returned to Scotland, and died at Moffat, on the 26th of November, 1836, in the eighty-first year of his age. He was twice married. By his first wife he had three sons and three daughters, of whom two sons and two daughters survived. His second wife was Miss De Lancey, a lady of American extraction, and sister-in-law of Cooper the novelist, by whom he had no children.

M'CHEYNE, REV. ROBERT MURRAY. This young divine, whose brief life and labours produced such a wide and lasting impression, was born in Edinburgh, on the 21st of May, 1813. At the age of eight he entered the high-school of his native city, where he continued a pupil for six years, during the course of which he was distinguished among his class-fellows not only by his proficiency in the usual studies of the class, but his amiable, enthusiastic disposition and engaging manners. From the high-school he passed to the university of Edinburgh, and there, besides gaining prizes in the several classes, he distinguished himself by his proficiency in the study of modern languages and his taste in drawing, music, and poetry. On finishing the usual course of a university education, it is probable that his direction in life would still have remained to be decided, but for one of those solemnizing events which sometimes at such a crisis has confirmed the current and directed the course of those who have become eminent in the church. This was the death of his eldest brother, David, eight or nine years older than himself. In the same year (1831) he entered the divinity hall, which at this time enjoyed Dr. Chalmers for

its professor in theology, and Dr. Welsh for the chair of church history. Under such teachers it would have been difficult for a pupil of even ordinary capacity to remain inert and unaccomplished; in the case of Robert M'Cheyne there was an ardour that not only carried him onward in the studies over which they presided, but into that life of Christian activity and practical usefulness which they were so desirous to combine with the intellectual acquirements of young students in training for the ministry. Many of our living clergymen can still remember how both in Glasgow and Edinburgh Dr. Chalmers converted the divinity halls into evangelistic seminaries of Sabbath-school teachers and religious instructors of the poor; and with what hearty good-will they themselves, while students, enlisted in the good work, and plunged boldly into those recesses of ignorance and crime which, but for his exhortations, they would have never thought of entering; and how they thereby acquired that knowledge and aptitude for their future duties, which the mere lectures of the class-room could never have imparted.

After having finished the usual course appointed for students in divinity, and exhibited an amount of talent and acquirements that might have opened for him an entrance into the fairest fields of literary ambition, Mr. M'Cheyne was licensed as a preacher by the presbytery of Annan, on the 1st of July, 1835. The sphere of action to which he turned at the outset was both humble and laborious, being an assistantship of the joint-parishes of Larbert and Dunipace, having a population of 6000 souls, most of whom were colliers and workmen of the Carron Ironworks—a population sufficiently repulsive in station and manners, as well as in general moral character. His situation and his feelings are well described in his poem on *Mungo Park finding a Tuft of Green Grass in the African Desert*—a poem, by the way, which John Wilson, our prince of critics, has stamped with his honoured approval:—

"No mighty rock upreared its head
To bless the wanderer with its shade,
In all the weary plain;
No palm-trees with refreshing green
To gladden the dazzled eye were seen,
But one wide sandy main.

"Dauntless and daring was the mind
That left all home-born joys behind
These deserts to explore—
To trace the mighty Niger's course,
And find it bubbling from its source
In wilds untrod before."

"And ah! shall we less daring show,
Who nobler ends and motives know
Than ever heroes dream—
Who seek to lead the savage mind
The precious Fountain-head to find,
Whence flows salvation's stream?"

Thus he felt, and in this spirit he laboured during the ten months of his assistantship, not confining himself to the duties of the pulpit, careful and anxious though his preparations in that department were, but visiting in every house, and endeavouring to make himself acquainted with the character, spiritual condition, and wants of every individual. A happy proof of his diligence and discriminating character in this the most important part of clerical duty, is contained in a letter which he afterwards wrote to his successor, recommending to his attention the persons in whom he felt most solicitude. "Take more heed to the saints," he writes, "than ever I did. Speak a word in season to S. M. S. H. will drink in simple truth, but tell him to be humble-minded. Cause L. H. to learn in silence; speak not of religion to her, but speak to her case always. Teach A. M. to look simply at Jesus. J. A. warn and

teach. Get worldliness from the B.'s if you can. Mrs. G. awake, or keep awake. Speak faithfully to the B.'s. Tell me of M. C., if she is really a believer, and grows? A. K. has the light visited her? M. T. I have had some doubts of. M. G. lies sore upon my conscience; I did no good to that woman; she always managed to speak of things *about the truth*. Speak boldly. What matter in eternity the slight awkwardness of time?" In these *notanda* what a beautiful practical illustration we have of that chapter in the work of Herbert on clerical duties, which he has entitled *The Parson Visiting!*

While Mr. M'Cheyne was thus occupied in the united parishes of Dunipace and Larbert, he was only in training for the full work of the ministry, which he was now about to enter. This event occurred in November, 1836, when, after having been invited by the managers and congregation of the new church, St. Peter's, Dundee, to become a candidate for that charge, he preached on trial two several Sundays before them, and was accepted as their minister. The duties into which he now entered were of the most arduous description. His parish of St. Peter's, detached from that of St. John's as a *quoad sacra* parish, contained a population of 4000 souls; and the church itself, built in connection with the Church Extension Scheme, contained a congregation of 1100 hearers. His health, lately subject to severe trials, was in very indifferent condition, while the religious apathy of the town-folks of Dundee was such as to strike him at first with anxiety. Here he commenced the same ministerial labours to which he had been accustomed as a preacher, but with a sense of still deeper responsibility—not only preaching faithfully on the Sabbath after careful preparation and prayer, but visiting from house to house during the week-days, and often extending these evangelistic visits of examination and instruction, not only over the families of his own parish, but those of Dundee at large. Such superabundant labour was perhaps an error—but an error upon the safe side. In addition to these tasks he superintended the labours of his elders over the several districts into which his parish was divided, held weekly evening classes for the young of his congregation, and trained the more advanced of their number for becoming Christian communicants. He also held prayer-meetings on the Thursday evenings. These manifestations of earnest, tender, indefatigable solicitude for the spiritual interests of the community among which he was placed, could not but be felt and appreciated, and the multitudes that repaired to his ministrations on the Sabbath soon became permanent members of his flock, arrested as they were by the unction of his preaching, so correspondent to his whole character and actions; by the distinct arrangement of his ideas, and the clear as well as eloquent language in which they were expressed—even by the tones of his expressive voice, and unstudied yet graceful and appropriate action of his limbs, that had excelled in dancing and gymnastics before he became a student in theology. In the pulpit itself such natural and personal advantages are no trivialities—and but for them, perhaps, even Whitfield himself, that prince of pulpit orators, would have lived and died an undistinguished Methodist preacher. As the fame of his popularity and usefulness extended over the country at large, other parishes wished to have Mr. M'Cheyne for their minister; but tempting though such offers were, on account of higher emolument and lighter labour, he respectfully declined them. His motives for this were well explained in his remarks on an application of this kind from the parish of Skirling. Writing to his father,

he says:—"I am set down among nearly 4000 people; 1100 people have taken seats in my church. I bring my message, such as it is, within the reach of that great company every Sabbath-day. I dare not leave this people. I dare not leave 3000 or 4000 for 300 people. Had this been offered me before, I would have seen it a direct intimation from God, and would heartily have embraced it. How I should have delighted to feed so precious a little flock—to watch over every family—to know every heart—to 'allure to brighter worlds, and lead the way!' But God has not so ordered it. He has set me down among the noisy mechanics and political weavers of this godless town. He will make the money sufficient. He that paid his taxes from a fish's mouth will supply all my need."

From Scotland to Palestine, from Dundee to Jerusalem, is a strange transition—but this Mr. M'Cheyne was now called to undergo. The incessant action of mind and body during his ministerial course upon a constitution naturally delicate, had, towards the close of 1838, completely impaired his strength, and occasioned such a violent palpitation of the heart, that he was imperatively ordered by his medical advisers to discontinue his public labours, and seek a cure in change of place and occupation. He reluctantly complied, and passed over to Edinburgh, where he had not been long domiciled, when a proposal was made to him to join a deputation about to be sent by the Church of Scotland into the East, for the purpose of making personal inquiries into the condition of the Jews. Nothing could have been more opportune than such an offer. It gratified the longing for missionary enterprise that had stirred up his spirit from an early period, but hitherto without scope; it promised to restore that health of which he was now in quest without dreary useless inaction as its price; and it would lead him through those hallowed scenes and localities, the memory of which is so dear to every Christian heart, and which it recognizes to the very end as its native birthplace and home. As one of the four ministers who composed the mission, he commenced that interesting journey, of which a full account has been given to the public in the *Narrative of a Mission of Inquiry to the Jews from the Church of Scotland in 1839*. After a six months' tour, in which every day brought a change of scene and incident, he returned home in November, 1839, renewed in health, and impatient to resume his wonted duties. It was time that he should return, for one of these mysterious religious epochs, called a "revival," had occurred within his own parish, as well as the town of Dundee at large. It was similar to the event which, under the same title, had occurred nearly a century earlier at Cambuslang. On departing upon his mission to the East the assistant whom Mr. M'Cheyne left in his place had preached in Kilsyth, and there such a revival of religious feeling had occurred as seemed to recall the days of Pentecost. From Kilsyth the impulse reached Dundee, where its original agent was now stationed, and afterwards went with an electric sympathy through other parishes of Scotland. This religious popular movement so peculiar to Scotland, and yet so alien to the national character—as if that were the fittest place where such a doubtful impulse could be best tried and tested—was in full operation among his people when Mr. M'Cheyne returned, and in its working he recognized the finger of God. On this account he threw himself without hesitation into it, and was now more employed than ever in speaking comfort to the afflicted, and giving instruction to the doubtful and inquiring. The immediate fruits of this revival also were such as to fill him with

the most triumphant hope, notwithstanding the frequent instances that occurred among the seemingly converted, not only of wavering inconsistency, but even of positive downfall. As is well known, this great national religious stirring among the people preceded the Disruption, for which it served in some measure to prepare the way; and in these events, by which the Church of Scotland was finally rent in twain, Mr. M'Cheyne could not do otherwise than feel a deep vital interest. That principle of spiritual independence for which his brethren were contending, he had cherished and advocated from the beginning, and now that it was in peril, he prepared himself to sacrifice all for its sake. He therefore attended the solemn clerical meeting held in Edinburgh on the 11th of August, 1841, and subscribed the engagement by which the commission of the General Assembly bound itself to vindicate the liberties of the church by proceeding against the recusant ministers of the presbytery of Strathbogie, notwithstanding the state protection within which they had entrenched themselves. In the following year he was one of a clerical deputation that visited the north of England, for the purpose of preaching in chapels or in the open air, and instructing all who repaired to them in the great common principles of religion without reference to sect or party.

On returning to his charge at Dundee, Mr. M'Cheyne resumed his duties, and pursued them with a diligence which neither frequent attacks of sickness, nor a gradually decaying constitution, seemed in any way to abate. But his days were numbered, and his anticipations of a short life were about to be realized. In the midst of his preparations for the disruption that soon took place, in the event of which he had expressed his resolution to go forth as a missionary to our convict colonies, he was attacked by fever, the violence of which soon left no doubt of what would be its termination. Delirium followed, and in a few days he breathed his last. So intensely was he beloved, not only by the members of his flock, but the inhabitants of Dundee in general, that his death, coming especially with such suddenness, was lamented as a public calamity. The event occurred on the 25th of March, 1843, in the thirtieth year of his age, and seventh of his short but most useful and honoured ministry.

It is difficult, in so brief a notice, and in a life marked by so few striking incidents and changes, to convey a distinct idea of the worth of Mr. M'Cheyne, or the important character and results of his public labours. As a minister he might be called the Whitfield of Scotland; and in that one word we endeavour to comprise, as well as to convey, an impression of his apostolic life, character, and labours. Many indeed are the thousands still living, not only in his native land, but in England and Ireland, who will recognize the justice of such a title.

M'CRIE, THOMAS, D.D.—This most able and eloquent writer, whose generous selection of the chief subject of his authorship, as well as the felicitous manner in which he discharged the task, will connect his memory with the illustrious name of John Knox, was born in the town of Dunse. He was the eldest of a family of four sons and three daughters, and was born in November, 1772. His father was a manufacturer and merchant of the above-mentioned town, and lived to witness the literary celebrity of his son, as his death did not occur till 1823. The subject of this memoir was peculiarly fortunate in his parentage, especially in having a mother whose deep-toned, devoted, feminine piety seems, at a very early period, to have directed the feelings and

moulded the religious character of her eldest son. As his parents belonged to that class of the Secession called Antiburghers, Thomas M'Crie was born and nursed in that community, at a time, too, when it still retained much of the primitive earnestness and simplicity of the old days of the covenant. On being sent to the parish school, he soon became not only an apt scholar, but distinguished for those habits of laborious application by which he was trained to his future work of historical and antiquarian research. This progress, however, was somewhat alarming to his cautious father, who saw no reason for impoverishing a whole family to make his first-born a finished scholar; and had his paternal purposes been carried out, perhaps the future biographer of Knox and Melville would have become nothing better than a thriving Berwickshire store-keeper, or, it may be, a prosperous mercantile adventurer in London. But kind relatives interposed, and the boy was allowed to follow his original bent. This he did so effectually, that before he had reached the age of fifteen he was himself able to become a teacher in two country schools successively, and thus to proceed in his studies without occasioning the apprehended incumbrance.

It was soon settled that aptitudes so decided, and acquirements which had already brought him into notice, should be devoted to the work of the ministry; and accordingly, at the age of sixteen, Thomas M'Crie left home to be enrolled as a student in the university of Edinburgh. His pious, affectionate mother accompanied him part of the way, and when the painful moment of farewell had arrived, she took him aside into a field upon Coldingham Moor, and there, kneeling down with him behind a rock, she solemnly commended him and his future career to that God who gave him, and to whose service she now willingly resigned him. In a year after she died; but the memory of that prayer abode with him, while its answer was attested in his future life and labours. His favourite studies at the university, as might be surmised, were those allied with ethics, philology, and history—all that is closely connected with the development of human character, and the most effectual modes of delineating its manifold and minute phases. It is no wonder, therefore, if among the professors who at this time were the ornaments of the college, Dugald Stewart was his favourite instructor. In this way his course went on from year to year, his studies being frequently alternated with the laborious work of the schoolmaster, but his mind exhibiting on every occasion a happy combination of student-like diligence with healthful elastic vigour. In September, 1795, he was licensed to be a preacher by the Associate presbytery of Kelso; and in this capacity his first public attempts were so acceptable, that in little more than a month after being licensed he received a call from the Associate congregation in the Potter Row, Edinburgh, to become their second minister. Thus early was he settled in the precise sphere, where not only his talents as a minister could be turned to best account, but the proper facilities afforded for that important literary career in which he was destined to become so eminent.

A short time after he had entered the work of the ministry, he married Miss Janet Dickson, daughter of a respectable farmer in Swinton, to whom he had long been attached, and found in her a suitable domestic friend and comforter, until death dissolved their union.

At the outset of his ministry Mr. M'Crie's sermons were distinguished by a careful attention to those requirements of eloquence and rules of oratory, in which he was so well fitted to excel. Indeed, the

more aged of his brethren seem to have been of opinion that he carried these to such an undue length, as to be in danger of recommending himself more highly than the great subject of which he was but the herald. He soon appears to have been of the same opinion himself, more especially after a missionary tour through the Orkney Islands, hitherto in a state of grievous spiritual destitution, but now eager to hear the word of life, in whatever form it was proclaimed; and there he saw, in the demeanour of his primitive audiences, the vast importance of the great doctrines of salvation, as compared with those mere human appliances by which it is adorned and recommended. This wholesome conviction brought him back, not however with a recoil into the opposite extreme, but into that happy medium where the true grandeur of the subject is allowed its full predominance, and where its expression is only valued by how much the speaker himself is absorbed and lost sight of in his all-important theme. This indeed is the secret of true pulpit eloquence; and to this eloquence Mr. M'Crie attained after his return from the Orkneys. The consequence was, that his acceptability as a preacher increased, his auditory became greatly more numerous, and a deeper spirit of earnestness was manifested in the general bearing and character of his congregation. Such were the fruits of that act of self-denial which talented aspiring young clergymen find so difficult to perform. The same spirit of disinterested devotedness to his work was also evinced by Mr. M'Crie in trials which some may reckon equally hard to be withstood. Though his flock was numerous, it was chiefly from the humbler classes, so that his income was a small one; and in 1798 the price of provisions rose so high that families of limited means were reduced to unwonted privations. In this state of things the congregation of Potter Row adopted the generous resolution of increasing the salary of their minister; but no sooner did he hear of it than he wrote to them a letter, earnestly dissuading them from the measure. "The allowance which you promised me," he said, "when I first came among you as your minister, and which has been always punctually paid, though not so liberal as what may be given to others of the same station in this place, has hitherto been sufficient. From any general knowledge I have of the state of your funds, it is as much as you can be supposed to give, especially considering the burdens under which you labour. The expense of living has indeed been increasing for some time past, but the incomes of trades-people have not increased in proportion; and as the most of you are of that description, I don't consider myself entitled to make any increasing demand upon you." This kind negation was gratefully received, and inserted in the minute-book of the congregation. Here, however, the disinterestedness of their pastor did not terminate. That period of famine, so universal throughout Britain, and still well remembered in Scotland under the title of "the dearth," had reached its height in 1800, so that the middle were now transformed into the lower classes, while the lower were little better than paupers. At this crisis the minister stepped forward with a generous proposal; it was that, in consequence of the prevalent poverty, the amount of his stipend should be reduced. The people, however, who were able to appreciate his motives, refused to consent, and thus ended a contest that was equally honourable to both.

After this the life of Mr. M'Crie was fated for some time to be embittered by ecclesiastical controversy. It is well known to our readers that the great subject of religious debate in Scotland has been, since the Reformation, not so much about Christian doc-

trine as about Christian polity. What is the duty of the state in aiding, upholding, and fortifying the spiritual government of the church? And what is the nature and amount of that deference which the church should render to the state in return, compatible with her spiritual independence—or rather, her allegiance to her great Head and Sovereign? The relationship between these powers was fully established in Scotland by the first and second Books of Discipline, and finally ratified by the Confession of Faith at Westminster. But toward the close of the last century the principles of the French revolution, so active in other countries, had also found their entrance into Scotland; and there they menaced not only the civil but also the ecclesiastical authority of the state. This was especially the case in that body called the Secession, to a part of which Mr. M'Crie belonged. The Seceders had caught that Gallican spirit so hostile to kings and rulers, and they now found out that all connection between church and state should cease. Each party was to shift for itself as it best could, without the aid or co-operation of the other; while kings and magistrates, instead of being bound by their office to be nursing fathers of the church, were engaged to nothing more, and could claim nothing higher, than what they might effect as mere members and private individuals. In this way the voluntary principle was recognized as the only earthly stay of the church's dependence, and the party who adopted it thenceforth became not seceders from the Establishment, but dissenters. It was thus that they closed and bolted the door against any future reunion with the parent church, let the latter become as reformed and as pure as it might. In this painful controversy Mr. M'Crie was deeply involved; and, superior to that restless spirit of modern innovation by which it was animated, he took the unpopular side of the question, and held fast by those original standards of the Secession which the majority were so eager to abandon. The result was that numbers and votes prevailed, so that he and three conscientious brethren of the church who held the same principles with himself were formally deposed in 1806. The dissentients, under the new name of the Constitutional Associate Presbytery, were thus dispossessed of their churches, but not of their congregations, who still adhered to them; and in the new places of worship to which they repaired they continued to exercise their ministry as before. In this way they formed a separate and distinct, though small and unnoticed, body until 1827, when they united themselves with another portion of protesters from the same synod, under the common title of Original Seceders.

During the progress of these events, which extended over a course of years, and with which Mr. M'Crie was so vitally connected, their whole bearing had a most momentous influence upon his future literary labours. They threw his mind back upon the original principles of the Scottish Reformation, and made them the chief subjects of his inquiry; they brought him into close contact with those illustrious characters by whom the Reformation was commenced; and they animated and strengthened that love of religious consistency, and hostility to ecclesiastical tyranny and oppression, that accorded so materially with his original character. In the following sentence from one of his letters in 1802 we can well recognize the man who set at nought the demolition of such things as cathedrals and monasteries, when they hindered the erection of a true church, and who was well fitted to become the biographer of him whose stern principle was, "Pull down the nests and the rooks will flee." "There is something," he thus writes, "in

the modern study of the fine arts, *belles-lettres*, and mere antiquities, that gives the mind a *littleness* which totally unfits it for being suitably affected with things truly great in characters eminent for love of religion, liberty, and true learning. To demolish a Gothic arch, break a pane of painted glass, or deface a picture, are with them acts of ferocious sacrilege, not to be atoned for, the perpetrators of which must be *ipso facto* excommunicated from all *civil* society, and reckoned henceforth among savages; while to preserve these magnificent trifles, for which they entertain a veneration little less idolatrous than their Popish or pagan predecessors, they would consign whole nations to ignorance or perdition." Sentiments thus inspired, and researches so conducted, were not allowed to lie idle; and accordingly, from 1802 to 1806, he was a contributor to the *Christian Magazine*, the pages of which he enriched with several valuable historical and biographical sketches. The titles of these sufficiently indicated the nature of his present studies, while their excellence gave promise of what might yet be accomplished. The chief of them were an "Account of the Concluding Part of the Life and the Death of that Illustrious Man John Knox, the Most Faithful Restorer of the Church of Scotland," being a translation from the work of Principal Smeton; a "Memoir of Mr. John Murray," minister of Leith and Dunfermline, in the beginning of the seventeenth century; a "Sketch of the Progress of the Reformation in Spain, with an Account of the Spanish Protestant Martyrs;" "The Suppression of the Reformation in Spain;" the "Life of Dr. Andrew Rivet," the French Protestant minister; the "Life of Patrick Hamilton;" the "Life of Francis Lambert, of Avignon;" and the "Life of Alexander Henderson." The journal in which they appeared was of but limited circulation, and its literary merits were little appreciated, so that these admirable articles were scarcely known beyond the small circle of subscribers to the *Christian Magazine*, most of whom were Seceders. But it was better, perhaps, that it should be so. These were only preliminary efforts, and preparations for great achievements, that are generally best conducted in silence, and which the gaze of the public will only interrupt or impede.

In this way the mind of the author had been imbued with the subject of the Reformation at large; and he had been thus led to study its developments, not only in Scotland, but in Spain, France, and Italy. But in which of these important departments was his first great attempt in historical authorship to be made? Happily, his mind was not out at sea upon this conclusive question, for by the close of 1803 his choice had been decided. It was that of a leal-hearted Scotsman and zealous Covenanter, and on the proposal that had been made to him of writing a separate work instead of unconnected articles, he thus replies:—"As you have suggested this, I shall use the freedom of mentioning to you a floating idea which has sometimes passed through my mind, without ever assuming the formality of a resolution or design; namely, a selection of lives of Scottish reformers, in some such order as to embrace the most important periods of the history of the Church of Scotland; in which a number of facts which are reckoned too minute and trivial for general history might be brought to bear upon and occasionally illustrate it. The order, for instance, might be (I write merely from the recollection of the moment) Patrick Hamilton, George Wishart, John Knox, John Craig, Andrew Melvine, Patrick Simpson, Robert Bruce, &c." It is easy to see how this variety, comprising the chief personages of the first and second

great movements of the Scottish Reformation, would finally resolve themselves into Knox and Melville, to whom the others were merely subsidiary. With Knox, therefore, he commenced; and the task was not an easy one. Obscure authors had to be discovered, and long-forgotten books resuscitated; contending facts had to be weighed, and contradictory statements reconciled; while a mass of manuscripts, such as might have daunted the most zealous antiquary at a period when Scottish antiquarianism was still in infancy, had to be pored over and deciphered, in quest of facts that were already fading away with the ink in which they were embodied, but whose final extinction his patriotic zeal sufficed to prevent. And all this was to be accomplished, not by the snug fellow of a college, reposing in learned leisure in the deep shadow of Gothic halls which the sound of the world could not reach, with half-a-mile of library before and behind him; or a church dignitary, whose whole time could be devoted to the defence of that church in which he was a high-titled and richly-guerdoned stipendiary; but by one who had the weekly and daily toil of a Scottish Secession minister to interrupt him, as well as its very scanty emoluments to impede his efforts and limit his literary resources. And all this for what?—not to write the life of one whose memory was universally cherished, and whose record all would be eager to read. The whole literary world was now united against John Knox, whose very name was the signal for ridicule or execration. The man whose heart was so hard and pitiless that the tears of Mary fell on it as upon cold iron—who demolished stately architectures and fair churches from sheer hatred of whatever was grand or beautiful—who shared in, or at least who countenanced, the foulest assassinations of the period—and who had finally imposed upon the land a sour, shrivelled, and soul-stunting creed, under the name of a reformation, which, thanks to *Moderatism!* the country was now getting rid of—this was he whom M'Crie, under every disadvantage and at every hazard, was resolved to chronicle and to vindicate. Of all the thousands and myriads whom his *Life of Knox* has delighted, how few are able to take into account the difficulties under which the author laboured, and the high heroic devotedness in which the task was pursued to the close!

The materials for this important work, as may readily be surmised, had been long in accumulating: as for the *Life* itself, it appears to have been fairly commenced in 1807, and it was published in 1811. On its appearance the public for a while was silent: many were doubtless astonished that such a subject should have been chosen at all, while not a few must have wondered that it could be handled so well. A complete change was to be wrought upon public feeling, and the obloquy of two centuries to be recanted; but by what literary organ was such a palinode to be commenced? At length "the song began from Jove"—for the first key-note was sounded, and the chorus led, by no less a journal than the *Edinburgh Review*, now the great oracle of the world of criticism, while the article itself was written by no less a personage than Jeffrey, the hierophant and pontifex maximus of critics. After commencing his critique with an allusion to those distinguished benefactors whose merits the world has been tardy in acknowledging, the reviewer thus continues:—"Among the many who have suffered by this partiality of fortune, we scarcely know any one to whom harder measure has been dealt than the eminent person who is the subject of the work before us. In the reformed island of Great Britain no honours now wait on the memory of the greatest of the British

reformers; and, even among us zealous Presbyterians of the north, the name of Knox, to whom our Presbyterian church is indebted, not merely for its establishment, but its existence, is oftener remembered for reproach than for veneration; and his apostolical zeal and sanctity, his heroic courage, his learning, talents, and accomplishments, are all coldly forgotten; while a thousand tongues are still ready to pour out their censure or derision of his fierceness, his ambition, and his bigotry. Some part of this injustice we must probably be content to ascribe to the fatality to which we have already made reference; but some part, at least, seems to admit of a better explanation." After having stated these palliating circumstances, in which a portion of the general prejudice originated, the critic adds: "From these, or from other causes, however, it seems to be undeniable that the prevailing opinion about John Knox, even in this country, has come to be that he was a fierce and gloomy bigot, equally a foe to polite learning and innocent enjoyment; and that, not satisfied with exposing the abuses of the Romish superstitions, he laboured to substitute for the rational religion and regulated worship of enlightened men, the ardent and unrectified spirit of vulgar enthusiasm, dashed with dreams of spiritual and political independence, and all the impracticabilities of the earthly kingdom of the saints. How unfair and how marvellously incorrect these representations are, may be learned from the perusal of the book before us—a work which has afforded us more amusement and more instruction than anything we ever read upon the subject; and which, independent of its theological merits, we do not hesitate to pronounce by far the best piece of history which has appeared since the commencement of our critical career. It is extremely accurate, learned, and concise, and, at the same time, very full of spirit and animation, exhibiting, as it appears to us, a rare union of the patient research and sober judgment which characterize the more laborious class of historians, with the boldness of thinking and force of imagination which is sometimes substituted in their place. It affords us very great pleasure to bear this public testimony to the merits of a writer who has been hitherto unknown, we believe, to the literary world either of this or the neighbouring country; of whom, or of whose existence at least, though residing in the same city with ourselves, it never was our fortune to have heard till his volume was put into our hands; and who, in his first emergence from the humble obscurity in which he has pursued the studies and performed the duties of his profession, has presented the world with a work which may put so many of his contemporaries to the blush, for the big promises they have broken, and the vast opportunities they have neglected."

This was much, coming as it did from the *Edinburgh Review*, a work that hitherto had been by no means distinguished for its advocacy of Christian principles or love of evangelical piety; and nothing, therefore, was better fitted to arrest the attention of the world in behalf of the volume that had lately appeared. The subject thus discussed in the great northern journal for July, 1812, was taken up by its powerful southern rival, and in the *Quarterly Review* of July, 1813, appeared a critique, in which the reviewers, in their admiration of John Knox, seem to have allowed their well-known devotedness to Episcopacy and Toryism for the time to go to sleep. After expressing their admiration that the Scottish reformer should have found a better biographer than had yet fallen to the lot of even Calvin and Luther, they thus characterize the literary merits of the work:—"Compact and vigorous, often coarse, but

never affected, without tumour and without verbosity, we can scarcely forbear to wonder by what effort of taste or discrimination the style of Dr. M'Crie has been preserved so nearly unpolluted by the disgusting and circumlocutory nonsense of his contemporaries. Here is no puling about the 'interesting sufferer,' 'the patient saint,' 'the angelic preacher,'

Knox is plain Knox, in acting and in suffering always a hero; and his story is told as a hero would wish that it should be told—with simplicity, precision, and force." Still, however, the reviewers could not well get over the demolished monasteries, or the tears of Queen Mary; and in their wrath they administered the following rebuke to the biographer, which, however, he accepted as no small compliment—"But of the literal subversion of many noble buildings, which, perhaps unavoidably, took place in the course of this great revolution, Dr. M'Crie permits himself to speak with a savage and sarcastic triumph, which evinces how zealous and practical a helper he would himself have proved in the work of destruction had he been born in the sixteenth century. Less, we are persuaded, would then have been heard of Row or Willock, as auxiliaries of Knox, than of M'Crie."

"Like Knox himself, he has neither a tear nor a sigh for Mary; and we doubt not that, like him, he would have voted to bring the royal adulteress and murderer, for such they both esteem her, to the block." "Is not that great praise?" says M'Crie, with good humour, while quoting to a friend this portion of the criticism. The other journals followed the lead of their two Titans; and encouraged by the reception of the work, and the high importance it quickly attained, the author commenced a second edition, in which he judiciously availed himself not only of the advice, but in many cases of the harsh censures, of his numerous reviewers. The result was, that in 1813 he published a second edition of the *Life of John Knox*, so greatly amplified and improved as to be almost a new work; and this, in course of time, was translated and published in French, Dutch, and German. Previous to the appearance of the second edition, the author had been honoured with the degree of Doctor in Divinity by the university of Edinburgh, the first instance in which it had ever conferred the title upon a dissenting minister. *O si sic omnes!* This distinction, however, Dr. M'Crie had neither sought nor expected; it was frankly given upon the application of Mr. Blackwood, his publisher, and the chief difficulty lay in persuading the author to allow the initials to be appended to his name in the second edition of the work. His opinion was, that such distinctions were incompatible with the strictness of Presbyterian parity. A compromise, however, was effected. He could not prevent the world from terming him *Doctor*, or become deaf when he was thus hailed; but when he went to the church courts he there sought equality with his brethren, and nothing more, and would allow himself to be designated as nothing higher than the Rev. Mr. M'Crie. It would indeed have been passing strange if our northern seats of learning had failed to confer their highest honours upon him who had achieved a literary feat so difficult, and achieved it so well. For by one great effort he had rolled back the tide of obloquy under which the most honoured of our national names had been buried so long, and restored it to its proper eminence and lustre. He had enabled Scotsmen to avoid the shame which they and their fathers had felt when that name was mentioned in their hearing, and inspired them with an honest pride in the character of their reformer. He had even carried this success into England, and made John Knox as popular there as he was at first,

when he was the friend and assistant of Cranmer, the chaplain of Edward VI., and the solicited but recalcitrant object of an English mitre. But wider and wider still the circle of intelligence upon the character of the Scottish reformer had been expanded, until the pious and reflective of Europe at large were enabled to perceive, and obliged to confess, that the ruthless demolisher of goodly architecture, which every other country had spared, was neither an illiterate Goth nor a ferocious Vandal, but one of those illustrious few of whom history is so justly proud. All this was much, but it was not yet the utmost which Dr. M'Crie had effected. Knox had, as it were, been recalled to life, and sent once more upon his momentous mission. His presence was seen and his voice heard in every district in Scotland. A heedless generation, by whom he was despised or neglected, had been compelled yet again to hear the instructions which he had formerly uttered, and to bethink themselves how wofully these instructions had been forgot. In short, their attention had been irresistibly called to the subject of the Scottish Reformation, and the principles upon which their church had been founded, and to the inquiry as to whether these principles were still in operation or hastening to become a mere dead letter. And this inquiry was neither unnecessary nor in vain. A death-blow was struck at that Erastianism which had lately become so predominant in the Church of Scotland; and such was the spirit of research among the mouldering records of its long-neglected library, and the ardour with which they were published and diffused, that the former ignorance and indifference could be tolerated no longer. These effects went on from year to year, and their result we know. Scotland is now awake, and the creed which was almost filched from her relaxing hand is held with as tight a grasp as ever.

The next literary undertaking in which we find Dr. M'Crie employed was a conflict with an antagonist everyway worthy of his prowess. The "Great Unknown" was now in the ascendant, and as he wrote to amuse, he was sure of the sympathies of at least three-fourths of the community. Such he must have felt when he gave to the world the tale of *Old Mortality*, in which the Covenanters were held up to derision, while their sufferings were described as justly merited. All this was enough for the novel-reading public, that was too ignorant to know, and too idle to inquire, and accordingly the statements of Sir Walter Scott, embodied as they were in so attractive a form, were received as veritable history. Nothing was now more common in England, and it may be added in Scotland also, than to hear the martyr-spirit of the days of the covenant laughed at, and its choicest adherents represented as madmen, fanatics, and cut-throats. It was needful that the "Author of *Waverley*" should be met by a fitting antagonist, and this he soon found in the author of the *Life of John Knox*. No two such other men could have been culled from the crowded ranks of British literature—the one so completely the type of ancient feudalism and Episcopacy ingrafted on modern Toryism, and the other of the sturdy independence of the good old Whiggamores and the Presbyterian devotedness of Drumclog and the Grassmarket. Dr. M'Crie had also the greater right to step forward on this occasion, as the prince of novelists had intruded into a field too sacred for a mere holiday tale. An elaborate review of *Old Mortality* was therefore written and published in the first three numbers of the *Christian Instructor* for the year 1817. It could scarcely have been expected from one so competent to the task as Dr. M'Crie, that it

would have been otherwise than a complete historical refutation of the misstatements of the novel, and a successful vindication of the vilified Covenanters. But it was also something more than this in the eyes of Scott and his admirers; for it attacked him with a strength of wit and power of sarcasm that threatened to turn the laugh against himself, and foil him at his own chosen weapon. So at least he felt, and his complaints upon the subject, as well as his attempted defence in the *Quarterly Review*, bespoke a mind ill at ease about the issue of such a controversy. The result was that the novelist was generally condemned, and that his tale, notwithstanding the popularity which at first attended it, sank in popular estimation, and became one of the least valued of all his admired productions.

The success with which the *Life of Knox* was attended would have been sufficient to make most authors repeat the attempt; but besides this, the task of Dr. M'Crie had already been chosen, of which his first great effort had only been the commencement. The distinguished lights of the Scottish Reformation had long stood arrayed before his view as successively demanding their due commemoration; and after having completed the first and best in the series, the choice of the next was not a matter of difficulty. "If the love of pure religion, rational liberty, and polite letters," he writes, "forms the basis of national virtue and happiness, I know no individual, after her reformer, from whom Scotland has received greater benefits, and to whom she owes a deeper debt of gratitude and respect, than Andrew Melville." Upon this therefore he had been employed for years, and towards the close of 1819 the *Life of Andrew Melville* was published. Such was the toil which this work occasioned him, that he was wont to say it had cost him "a hundred times more labour than the *Life of Knox*." This will be apparent when we consider not only the immense quantity of facts which such a narrative involved, but the difficulty of finding them, as they were no longer the broad, distinct, and widely published statements which so largely enter into the history of our first reformers. And yet, though the life of Melville is to the full as well written as that of Knox, and exhibits still greater learning and research, it never attained the same popularity. The cause of this is to be found in the subject itself. After the national hero has crossed the scene, all who follow in his path, be their deeds and merits what they may, must possess an inferior interest. Besides this, Melville was not a reformer from Popery, the common enemy of the Protestant church, but from Episcopacy; and therefore, while the interest of the event was mainly confined to Presbyterian Scotland, it excited dislike in England, while it awoke scarcely any sympathy in the Continental reformed churches. But will the work continue to be thus rated beneath its value? We scarcely think so. The great question of centuries—the question of the rights of the church in reference to its connection with the state—promises to become more generally felt and more keenly agitated than ever; and in this important controversy the opinions and example of Andrew Melville are likely to assume their due weight. And where, in this case, will posterity be likely to find a record better written than that of Dr. M'Crie? It may be, that before the present century has closed, his *Life of Andrew Melville* will be more widely perused and deeply considered than the author himself could have anticipated.

Calamities and afflictions of various kinds were now at hand to try the temper and purify the patience of the hitherto successful author. The perils by

which the principle of church establishment was beset, and the prospect of further division among Christian communities, clouded his spirit with anxious forebodings—for his was not a temper to rest satisfied that all should be well in his own day. Domestic sorrow was soon added to his public anxieties; for his amiable partner in life, who for the last six years had been an invalid, was removed from him by death in June, 1821. Soon afterwards his own health began to fail, in consequence of his intense application to study; and even his eyesight was so impaired with the poring of years over dim and difficult manuscripts, as to threaten total blindness. Cessation from labour and the recreation of travel were judged necessary for his recovery; and accordingly, in the summer of 1822, he made a short tour of two months to the Continent, during which his studies were only changed, not suspended, and he returned home considerably invigorated in health and spirits. On his return a new and soul-inspiring subject quickly brought him into action; it was the cause of Greece, that land so trampled under foot and crushed into the dust by centuries of oppression, but now rising from the dead; the first to attempt the great historical problem as to whether a whole nation may be capable of a resurrection and a new life, after ages of death and burial. But something more than mere historic curiosity was aroused by the event. Sympathy was also kindled throughout our whole island for the sufferings of the Greeks in their new war of independence, so that British swords and British money were freely tendered in their behalf. And not the least or the latest in this good cause was the city of Edinburgh, now rejoicing in the title of "Modern Athens," and prompt, by its brotherly sympathy, to make that title good. Public meetings were called for the purpose of raising money for the relief of the inhabitants of Scio, and for the promotion of education in Greece, and on both occasions Dr. M'Crie was enlisted as the advocate of suffering Hellas. He was now to appear before the public in a new phase. Hitherto he had carefully avoided addressing such meetings, while his pulpit oratory was the stern unadorned didactic theology of the old school. But eloquent as was the historian of Knox in the closet, and amidst historic details, was he also capable of eloquence in the crowded popular assembly, with a subject so delicate as Greece for his theme? The answer was given in addresses so imbued with the spirit of ancient heroism and Marathonian liberty—so pervaded by the classical tone of Athenian poetry—and so wide in their range, from playful, refined, subtle wit, to the most vehement and subduing appeals of outraged indignant humanity—that the audiences were astonished and electrified. Under what strange bushel had Dr. M'Crie hid such eloquence so long? It was now evident that, had he so pleased, he might have been among the first of our orators. But hitherto he had been content to be known as a theologian and historian, while he magnanimously left it to others to shine upon the platform; and having now performed his allotted task, he retired, amidst the deep wonderment of his hearers, to the modest seclusion of his study, and the silent labours that awaited him there.

And these labours were not pursued remissly. Besides his studies for the pulpit, which he prosecuted with all the diligence of his early days, he continued his researches into the history of the period of the Reformation; and in 1825 he published his edited "*Memoirs of Mr. William Veitch and George Bryson*, written by themselves," narratives which he considered of high importance, as illustrative of the covenanting days of Scotland, and to which he ap-

pended biographical sketches and illustrative notes. In 1827 appeared his *History of the Progress and Suppression of the Reformation in Italy*, a work that had formed the subject of his earlier studies, but for many years had been laid aside. It was a most complex and laborious task, as he was obliged to trace the origin, progress, and decline of the Reformation through twenty-five of the Italian states, among which the great movement was divided. Such was the interest of this work, that it was translated into French, German, and Dutch, and inserted by the ecclesiastical tribunal of Rome in the *Index Expurgatorius*. In 1829 he published the *Progress and Suppression of the Reformation in Spain in the Sixteenth Century*, a sequel to the *History of the Reformation in Italy* during the same period. As a proof of his indefatigable diligence and zeal in the study of history, it may be mentioned here, that in order to make himself fully acquainted with the two last subjects, he had mastered, in the decline of his days, the Spanish and Italian languages, that he might study the proper authorities from their original sources. While Dr. M'Crie was thus occupied, the bill introduced in 1829 for the emancipation of Roman Catholics from political restrictions, and their admission into places of authority and trust, was passed. It is perhaps unnecessary to add, that one who had studied and written as he had done, was entirely opposed to the measure. He not only thought it unsafe to concede such privileges, in a Protestant country, to men doing homage to a foreign ecclesiastical power and a hostile creed, but he was also of opinion that by such concessions our country abandoned the solemn engagements to which it had pledged itself since the Reformation, and forfeited the privileges which it enjoyed as the head of European Protestantism. In the old covenanting spirit he carried the subject to the pulpit, where it had but too much right to enter, and in his lectures on the book of Ezra, where it could be appropriately introduced, he uttered his prophetic warnings. "We have been told from a high quarter," he said, "to avoid such subjects, unless we wish to rekindle the flames of Smithfield, now long forgotten. Long forgotten! Where forgotten? In heaven? No. In Britain? God forbid! They may be forgotten at St. Stephen's or Westminster Abbey, but they are not forgotten in Britain. And if ever such a day arrives, the hours of Britain's prosperity have been numbered." He drew up a petition against the measure, which was signed by 13,150 names, but this, like other petitions of the same kind, was ineffectual. The bill was passed, and silly, duped, disappointed Britain is now ready, like the Roman voter in favour of Coriolanus, to exclaim, "An it were to do again—but no matter!"

The career of Dr. M'Crie was now drawing to a termination. His literary labours, especially in the lives of Knox and Melville, combined with his extreme care that every idea which he gave forth to the public, and every sentence in which it was embodied, should be worthy of those important subjects in which he dealt—all this, connected with the daily and almost hourly avocations of his ministerial office, and the numerous calls that were made upon him, in consequence of his interference with the great public movements of the day, had reduced him to the debility and bodily ailments of "threescore and ten," while as yet he was ten years short of the mark. But his was a mind that had never rested, and that knew not how to rest. In 1827 he had enjoyed the satisfaction, after much labour and anxiety, of seeing a union effected between the church party to which he belonged and the body who had seceded from

the Burgher and Antiburgher Synods in 1820, under the name of Protesters; and in 1830 his anxieties were excited, and his pen employed, in endeavours to promote a union between his own party, now greatly increased, and the Associate Synod of Original Burghers. Many may smile at these divisions as unnecessary and unmeaning, and many may wonder that such a mind as that of Dr. M'Crie should have been so intent in reconciling them. But religious dissension is no triviality, and the bond of Christian unity is worth any sacrifice short of religious principle; and upon this subject, therefore, the conscientious spirit of Dr. M'Crie was as anxious as ever was statesman to combine jarring parties into one, for the accomplishment of some great national and common benefit. While thus employed, a heavy public bereavement visited him with all the weight of a personal affliction; this was the death of the Rev. Dr. Andrew Thomson, who, in the full strength and vigour of his days, suddenly fell down and expired upon the threshold of his home, which he was just about to enter. By this event, which occurred on the 9th of February, 1831, Dr. M'Crie was bereaved of a close affectionate intercourse which he had for years enjoyed with a most congenial heart and intellect, and saw himself fated to hold onward in his course, and continue the "good fight," uncheered by the voice that had so often revived his courage. After he had rallied from the unexpected blow, Dr. M'Crie was employed in what was called the "Marrow Controversy," which, notwithstanding the uncouth title it bore, had for its object the vindication of the important doctrine of justification by faith from the perversions of Arminianism. This was followed by the anti-patronage controversy in 1833, a subject which the Kirk of Scotland had never lost sight of since the time when patronage was first imposed upon it, and which was now fast ripening into such important results as neither friend nor enemy could anticipate. As might be expected Dr. M'Crie was no mere onlooker. He belonged to a body whose conscientious hope was a return to the church of their fathers, when it was loosed from its bonds and purified from its errors; but who saw no prospect of the realization of that hope until the right of pastoral election was conceded to the people. Upon this question Dr. M'Crie published what proved to be the last work he was to produce as an author, in the form of an anonymous pamphlet, entitled, *What ought the General Assembly to do at the Present Crisis?* His answer to the question was express and brief: "Without delay petition the legislature for the abolition of patronage." The outcry in Scotland against patronage became so loud—so deafening—that statesmen saw they must be up and doing, and a committee of the House of Commons was appointed to hold an inquest upon the alleged grievance. It was natural that the most distinguished of Scotland's ecclesiastical historians should be heard upon the subject, more especially as his testimony was likely to be unbiassed either by party feeling or self-interest; and accordingly, besides the many eminent ministers of the Established church who were summoned before the committee, Dr. M'Crie was called to give his statement upon the effects of ecclesiastical patronage. He repaired to London at this authoritative summons, although with reluctance, and underwent two long examinations before the committee, the one on the 2d, the other on the 7th of May, 1834. It was not thus, however, that the question was to be settled; and he returned from London, wondering what would be the result, but comforting himself with the conviction that an overruling wisdom predominated

over earthly counsels, and that all would be controlled for the best.

Amidst these public cares and a debility in health that was daily increasing, Dr. M'Crie now addressed himself in earnest to accomplish what, in all likelihood, would have proved the most laborious of his literary undertakings. It was nothing less than a *Life of Calvin*, to which his attention had been directed during his studies upon the progress of the Reformation on the Continent, and for which he had collected a considerable amount of materials. This, however, was not enough, for he felt that, to accomplish such a work in a satisfactory manner, it would be necessary to consult the ancient records of Geneva, a step which his ministerial duties prevented. His friends, aware of his wishes on the subject, had offered to send, at their own expense, a qualified person to Geneva to transcribe the required documents; but this kind offer, which was made in 1831, he declined. In 1833, however, his son John, a young man of high talent, who was studying for the church, had repaired with two pupils on a travelling excursion to Geneva, and to him the task was committed of making the necessary extracts upon the subject. The commission could not have been better bestowed. "John has been so laborious in his researches," said the affectionate father, "and sent me home so many materials, that I found myself shut up to make an attempt, if it were for no other reason than to show that I was not altogether insensible to his exertions." He felt more and more the growing lassitude that was stealing upon him, and thus wrote, eight months afterwards, about the materials that were pouring in upon him from Geneva: "I have neither time nor leisure to avail myself of them; and instead of rejoicing, as I used to do, at the sight of such treasures, I rather feel inclined to weep. Yet if I can make nothing of them, some other may." Thus he went on till the middle of the following year, his attention to Calvin being in the meantime divided by the great ecclesiastical events that were hastening onward to the disruption of the Church of Scotland. Of the life of the great reformer, however, he had already written out and prepared for the press three ample chapters, in which Calvin's career was traced through the studies of his youth, onward to his adoption of the reformed doctrines, his preface to the *Institution of the Christian Religion*, and his residence in Geneva. But here the historian's task was to terminate, and terminate most unexpectedly and abruptly. On the 4th of August, 1835, he was suddenly taken unwell; a stupor succeeded, from which it was impossible to rouse him; and on the following day he breathed his last, without a groan or struggle, but insensible to the presence of his grieving friends who were assembled round his deathbed. Thus died, in the sixty-third year of his age and fortieth of his ministry, the Rev. Dr. M'Crie, whose whole life had been a preparation for death, and whom death, therefore, could not take at unawares. His remains were buried in the churchyard of Grayfriars, and over the grave a simple monument was erected by his congregation, with an inscription commemorative of his worth and their regret. At his death he left a widow, for he was twice married, upon whom government, to show their sense of his worth, settled a liberal pension. His children, who were all by his first marriage, consisted of four sons, of whom John, the third, his faithful assistant among the archives of Geneva, died only two years after his father. Besides these, he had one daughter, married to Archibald Meikle, Esq., Flemington. It is pleasing to add that of the family of such a man, there is one who inherits not only his name and

sacred office, but also his tastes and studies, and not a small portion of his talent.

Besides those works to which we have already adverted, Dr. M'Crie was author of the following publications :—" *The Duty of Christian Societies towards Each Other*, in relation to the Measures for Propagating the Gospel, which at Present engage the Attention of the Religious World; a Sermon preached in the Meeting-house, Potter Row, on occasion of a Collection for promoting a Mission to Kentucky." 1797.—"*Statement of the Difference between the Profession of the Reformed Church of Scotland as adopted by Seceders, and the Profession contained in the New Testament and other Acts lately adopted by the General Associate Synod*; particularly on the Power of Civil Magistrates respecting Religion, National Reformation, National Churches, and National Covenants." Edinburgh, 1807.—"*Letters on the late Catholic Bill, and the Discussions to which it has given Rise*. Addressed to British Protestants, and chiefly Presbyterians in Scotland. By a Scots Presbyterian." Edinburgh, 1807.—"*Free Thoughts on the late Religious Celebration of the Funeral of Her Royal Highness the Princess Charlotte of Wales*; and on the Discussion to which it has given rise in Edinburgh. By Scoto Britannus." 1817.—"*Two Discourses on the Unity of the Church, her Divisions, and their Removal*." Edinburgh, 1821.—"*Sermons* (posthumous volume). Edinburgh, 1836.—"*Lectures on the Book of Esther* (posthumous). Edinburgh, 1838.

M'CULLOCH, HORATIO, R.S.A. Among the numerous Scottish artists who have distinguished themselves in the present century, an important place must be assigned to Horatio M'Culloch. Like many of his brethren who have become renowned in the ranks of artists, he was of humble origin, and was born in the city of Glasgow in the latter part of 1805—a period distinguished in our naval history by the victory of Trafalgar. This event, by which the naval supremacy of Britain was established, excited nowhere greater stir than in Glasgow, the growing prosperity of which was so dependent upon our command of the seas; and on the night of the brilliant illumination for the victory, in which the exultation of our western capital was all but frantic, our painter was born. The same event decided his parents in giving him the name of Horatio, after the great naval hero who had won the victory, and passed away in the blaze of his fame. The talent of the future artist was early manifested, and so strongly, that his father and family were too wise to thwart it; and Horatio M'Culloch, encouraged and aided by his sister not only in his earliest attempts, but those of his riper years, followed his bias for art, until it became his sole occupation. His first regular instructor in his future profession was Mr. Alexander Watt, teacher of drawing in Glasgow; and at this period he formed a friendship that lasted for life with Daniel Macnee, the well-known portrait-painter, who, like himself, was an enthusiastic student of art. Macnee being the pupil of Knox, at that time a landscape-painter of some repute in Glasgow, easily prevailed upon Horatio M'Culloch to become a pupil of the same instructor. Here the two young artists studied and painted side by side. When Mr. Macnee left Glasgow in 1825, being engaged by Mr. Lizars, engraver, Edinburgh, to colour the engravings of Selby's work on *Ornithology* and Dr. Lizars' *Anatomy*, he was soon after followed by M'Culloch, who, on the recommendation of his friend, was employed by Lizars in the same occupation. But the colouring of anatomical and ornitho-

logical plates was too mechanical an employment to satisfy the longings of Horatio; and while he attended his place of work at the appointed hour of nine o'clock in the morning, it was often after a sketching excursion of several miles in the neighbourhood of Edinburgh. On the close of his engagement with Mr. Lizars, our young artist returned to Glasgow, resolved to devote himself wholly to the cultivation of landscape painting; and being soon after thrown upon his own resources by the death of his father, he painted several pictures for sale; but as these were chiefly sketches, and of small dimensions, their merits were not so conspicuous as to arrest the notice of ordinary purchasers. But this despondent state of things was somewhat relieved by Mr. Macnee, who showed some of M'Culloch's sketches to the late Provost Lumsden of Glasgow, who appreciated their merits, and employed their author in executing several large pictures for a hall which he was then building. This commission was so successfully executed as to bring him into some notice, and secure for him several small orders, but still his professional income was at best precarious and scanty. Among the artistic shifts to which he had resort, after returning to Glasgow, was painting views on snuff-boxes for Mr. Smith of Mauchline; but even from such occupation true genius can emerge, and at least two others who were employed with him in the same task afterwards became artists of great eminence.

In 1828 M'Culloch had for the first time an opportunity of testing his powers against those of artists of established reputation. In that year the Glasgow Dilettanti Society opened their first exhibition, and to that collection M'Culloch sent four pictures. This exhibition was successful, and was followed up for several years by others, to all of which he contributed pictures, by which he became favourably known in Glasgow. In 1831, 1833, and 1834 he had sent several paintings (fourteen in all) to the Royal Scottish Academy's exhibitions, and on the two latter occasions the merits of his works were so striking, that in November, 1834, he was elected an associate of the Academy. In the next year (1835) he sent eight contributions to the exhibition, which amply justified his title to the distinction bestowed on him; among these were his "View in Cadzow Park, near Hamilton, part of the Ancient Caledonian Forest," a work greatly in advance of any of his former productions. This picture was so highly praised by Professor Wilson, that he then received a fresh impulse, and the continued commendations of Christopher North became an encouraging incentive to higher efforts. In the exhibition of 1836 he had five pictures, one of which, entitled "A Scottish Strath," fully supported the high position he had already acquired. In 1838, when the first vacancy occurred, he was elected an academician, and regularly thereafter he continued to contribute pictures to the annual exhibitions, all marked by the same high qualities that had commanded not only the attention of the public, but of the critical in art. Horatio M'Culloch soon became acknowledged chief of Scottish landscape-painters—a pre-eminence which continued with him until the close of his life; and to this department of art, in which he had secured such distinction, he continued exclusively to devote himself. In the year 1837, before he was elected an academician, Mr. M'Culloch removed from Glasgow to Edinburgh, and there he continued to reside till the close of his career; but during the greater part of the summer he was in the country, making studies and sketches for his exhibition pictures, and for the commissions which he had now constantly on hand. These summer excur-

sions were always directed by the work that for the present required his attention; and thus he was sometimes located at some spot in the neighbourhood of Edinburgh, sometimes in the neighbourhood of Hamilton, and sometimes on the banks of the Firth of Clyde. But it was not to the gentle and softened beauties of Lowland scenery that his pencil was confined; he also delighted to paint the wild rugged magnificence of the Highlands, in all its variety of land and water, with their varied aspects of sunshine, gloom, and storm; and for this purpose he frequently took up his residence in Inverness-shire, Oban, and Skye. It was in one of these artistic tours to Skye, on visiting it for the first time in 1847, that he married Miss M'Lellan, cousin of the wife of his friend, Alexander Smith, the poet. From sojourning in the Highlands, he would pass to the repose of the Lowlands, and its woods, lakes, and rivers, among which he constantly found fresh themes for his pencil.

Such was the artist life of Horatio M'Culloch, with but little variation over a course of forty years, in which the high excellence of the produce was almost equalled by the amount. In fact, it might be said of him, not merely that he lived by painting, but that he lived to paint. His contributions to the Royal Scottish Academy alone were one hundred and ninety-three, and among these were the most finished and best of his productions. We can only enumerate some of his larger and more important works, which are the following:—

- 1833—Head of Lochfyne—stormy effect.
- 1834—Arran as seen from Bute—sunshine bursting through a rainy cloud.
- 1835—View in Cadzow Park, near Hamilton. Part of the Ancient Caledonian Forest.
View from the Roman Camp at Dalzell, near Hamilton.
- 1836—A Scottish Strath.
Loch Eck, Argyleshire.
- 1837—Loch-an-Eilan, with the Stronghold of the Wolf of Badenoch.
This picture is well known from the large and fine engraving by William Miller.
- 1838—View in Cadzow Forest.
Beautifully engraved by Forrest for the Abbotsford edition of the *Waverley Novels*.
Loch-an-eilan, Inverness-shire, with part of the Pine Forest.
- 1839—Castle Campbell, near Dollar.
- 1840—Edinburgh from Corstorphine Hill—effect after Rain.
Moonlight—Deer started.
- 1841—Glen Messen, Argyleshire.
Cambuskenneth Abbey, near Stirling—Moonlight.
- 1842—A Road Scene on the Banks of Loch Long.
Arran, seen from Ettrick Bay, Island of Bute.
- 1843—Ben Venue and part of the Trossachs.
- 1844—A Dream of the Highlands.
This composition appears to be founded on scenery near the entrance to Loch Etive, Argyleshire.
Kilchurn Castle, Loch Awe.
Engraved by Forrest on a large size, for the Association for the Promotion of the Fine Arts.
- 1845—Ballachulish, on Loch Leven, Argyleshire.
Glencoe, Argyleshire.
- 1846—Bothwell Castle, River Clyde.
- 1847—Scene in the Marquis of Breadalbane's Deer Forest, Black Mount, Argyleshire.
Misty Corries—Haunts of the Red Deer.
- 1848—The Range of the Cuchullin Mountains, from Gillian Bay, Isle of Skye.
Loch Corriusk, Isle of Skye.
- 1849—On the Island of Inch Murren, Loch Lomond.
- 1850—A Quiet River.
- 1851—A Lowland River—Sunset.
Engraving on a large size for the Association for the Promotion of the Fine Arts.
- 1853—Glencoe, looking down the Glen—Mist rising after Rain.
Edinburgh from Spylaw—Autumn Afternoon.
- 1854—The Cuchullin Mountains, Isle of Skye.
- 1855—Knock Castle, and Sound of Sleat, Isle of Skye.
The Firth of Forth and Edinburgh, from Dalmeny Park.
- 1856—Storm on a Highland Coast, Isle of Skye.
Loch Ard, looking towards Benlomond—Sunset.
- 1857—Inverloch Castle, near Fort William.
Now in the Scottish National Gallery.
Summer-day in Skye—View of the Cuchullin Mountains.
- 1858—Moon Rising in a Highland Glen—Autumn.

- 1859—The Firth of Clyde and Dumbarton Castle, from Dalmott Hill.
- 1860—Loch Achray and the Trossachs.
Druidical Stones—Moonlight.
- 1861—Mist Rising off Mountains.
Sea Beach on the coast of Ayr.
- 1862—Ben-Venue, Loch Katrine, from near the Silver Strand.
The Island of Mull, from Kerrara—Sunset.
- 1863—Glencoe, from the Bridge of the Three Waters.
Loch Corriusk, Skye.
Loch Katrine, from the Silver Strand.
Deer Forest—Sligiehan, Isle of Skye.
- 1864—Kilchurn Castle, Loch Awe.
Sun rising through the Mist.
- 1865—Dunskiach Castle, Isle of Skye.
Glencoe, Argyleshire.
Loch Achray, Perthshire.
- 1866—Loch Katrine, Perthshire.
- 1867—Loch Maree, west of Ross-shire.

His other pieces, large and small, although so numerous, are distinguished by original genius and masterly execution, and well maintain his reputation as the best of Scottish landscape-painters. M'Culloch seldom sent pictures to the London exhibitions, and consequently was but little known there, except by art-critics. Two of his landscapes, however, which were in the great International Exhibition at Kensington in 1862, were distinguished among the choice productions of that collection, and elicited high commendation from the French critics—a distinction which to our artist was particularly gratifying. But it was in the exhibitions of the Royal Scottish Academy that his new works first appeared, and to that exhibition during his whole career they were chiefly confined. He was wont to send one or two important pictures, and several smaller ones, to each exhibition, and generally one or two annually to the exhibition in his native Glasgow.

Although Horatio M'Culloch was of a robust constitution, incessant application, and out-door exposure to changes of weather, began to tell upon his frame; and about fifteen years previous to his death, after having sat working in the open-air at Smalholme, he was attacked by a slight shock of paralysis, which affected his left side and the muscles of his face. From this however he soon rallied, and was able to continue his exertions with the same hardy vigour and diligence, and the same success, as before. In the winter of 1866 he experienced a second and still more severe stroke, from which he rallied with similar readiness and resumed his wonted occupation; but in February of the following year the third and worst attack occurred, which proved to be the final summons, and on the 24th of June, 1867, he expired, in the sixty-second year of his age. Of his talents as an artist it would now be superfluous to speak: these are attested by his numerous productions, which have established a reputation which time can only mellow and improve. His studies on the spot were usually painted in oil, and these were done with great care, many of them taking two or three weeks of constant work. He was very particular about the kind of trees that grew in certain localities, and the kind of vegetation peculiar to certain rocks and soils. While he retained the individual character of every object that he painted, from a cloud to a stone, he invested them with a certain grace and elegance that removed them from commonplace portraiture. He has been known to paint for a week upon the sky of one of his larger pictures before he was satisfied with the forms of the clouds. He seldom or never selected a scene in which buildings constituted an important feature. Neither did he often paint coast-scenery; but when he did so, water, whether still or in agitation, was rendered with rare fidelity and skill. His subjects are most frequently the moor, the loch, and the mountain side, far removed from the haunts of men; consequently human figures are but sparingly intro-

duced, and play a very subordinate part in his pictures; cattle and red deer appear much more frequently, and form more important features. His moonlight pictures are extremely fine, never black and inky, but clear, truthful, and beautiful in colour, with the richly-variegated clouds only seen in autumn. The freshness and truthfulness of his colouring, and the distinctive character he imparted to every object, are among the greatest excellences of his pictures. His landscape compositions, as well as views, are founded on carefully painted studies from nature, and in his most charming ideal work, *A Dream of the Highlands*, truthfulness reigns throughout its beauty. M'Culloch adopted no previous artist as his model. His style and mode of treatment were derived from an earnest study of nature rather than anything suggested by the works of his predecessors. His pictures may be said to approach more in character to those of Hobbema than to the works of any other well-known artist. Still, both in choice of subject and in treatment, they have distinctive individuality, and excellencies of a kind that are entirely their own.

With this professional excellence his personal character was in beautiful and harmonious keeping. Devoid of envy at the excellence of others, he was one of the first to recognize their merits; and having commenced his career as an unbefriended youth, he was only the more ready on that account to sympathize with the struggles of early genius, and extend his helping hand to the young who were worthy of success, but whose merits were as yet undiscovered. His earliest friendships were also his last, and the kindness of those who had first introduced him to notice he never forgot, and was not slow to acknowledge. Seldom, indeed, has such distinction as his been combined with such genuine modesty, simplicity, and unabated warmth of heart.

M'CULLOCH, JOHN RAMSAY. This industrious and useful statistical writer was born at Whithorn, Wigtonshire, on March 1, 1789. He was of a respectable family, who were proprietors of a small freehold estate called Auchengool, in the stewartry of Kirkcudbright, to which he succeeded on the death of his grandfather, who had been commander of a revenue cutter. From his maternal grandfather, the Rev. Dr. Laing, John received his early education, which consisted merely of the ordinary knowledge of his native tongue and the elementary principles of the classical languages. In youth, his future profession was not decided, so that, although placed in the office of a writer to the signet, he did not become a lawyer; and although he attended the classes of the university for two years, he neither graduated nor studied for any settled occupation. Accident, however, decided for him early in 1817, when having sent a communication to the *Scotsman* newspaper, then newly commenced, he became its editor for two years, and a frequent contributor to it for many years after. In 1818 Mr. M'Culloch commenced a series of contributions to the *Edinburgh Review*, the first of which was an article on Ricardo's *Principles of Political Economy*, and in addition to his writings upon the subjects of political science, he gave lectures on political economy.

Having thus established his reputation for knowledge in this particular department, Mr. M'Culloch left Edinburgh for London in 1828, in consequence of being appointed to the chair of political economy in University College, London. The chair, however, being unendowed, and the fees of his class producing an insufficient remuneration, he abandoned the charge, but continued to write on his favourite

theme, and to give lectures which were attended by some of the principal statesmen of the day. Such a man was not to be neglected, and in 1838 the Whig government gave evidence of its sense of his merits by appointing him to the important post of comptroller of H. M. stationery office, which he continued to hold until his death. The waste of paper in this department had long been proverbial; but Mr. M'Culloch introduced into it such a strict and proper spirit of economy, that useless expenditure was checked, and a saving to the nation effected, of which honourable mention was repeatedly made in parliamentary reports and returns.

But it was by his publications that he especially became a public benefactor, and upon these his chief reputation will be established, so that a list of them will suffice to constitute the chief part of his memoir; they were:—

"*A Discourse on the Rise, Progress, Peculiar Objects, and Importance of Political Economy*, containing an Outline of a Course of Lectures on the Principles and Doctrine of that Science," 8vo, 1825. "*The Principles of Political Economy*, with some Inquiries respecting their Application; and a Sketch of the Rise and Progress of the Science," 8vo, Edin. 1825; 4th edition, 1849. "*Statements Illustrative of the Policy and Probable Consequences of the Proposed Repeal of the Existing Corn-laws, and the Imposition in their stead of a Moderate Fixed Duty on Foreign Corn*," 8vo, 1841. "*A Treatise on the Principles and Practical Influence of Taxation and the Funding System*," 8vo, 1845. "*The Literature of Political Economy*, a Classified Catalogue of Select Publications in the Different Departments of that Science, with Historical, Critical, and Biographical Notices," 8vo, 1845. "*A Treatise on the Succession to Property vacant by Death*, including Inquiries into the Influence of Primogeniture, Entails, Compulsory Partition, Foundations, &c., over the Public Interest," 8vo, 1848. "*A Treatise on the Circumstances that determine the Rate of Wages and the Condition of the Labouring Classes*," post octavo, 1851. "*A Dictionary, Practical, Theoretical, and Historical, of Commerce and Commercial Navigation*, illustrated with Maps and Plans," 8vo; 2d edit. 1834; republished several times with improvements and additions in one volume. "*A Statistical Account of the British Empire*, exhibiting its Extent, Physical Capacities, Population, Industry, and Civil and Religious Institutions," 2 vols. 8vo. "*A Dictionary, Geographical, Statistical, and Historical, of the various Countries, Places, and principal Natural Objects in the World*, illustrated with Maps," two thick and closely printed volumes 8vo, originally published in numbers and completed in 1842; a new edition with large additions was published in 1856. "*Smith's Wealth of Nations*, with a Life of the Author, Notes, and Supplemental Disquisitions," 8vo; 2d edit. 1838, 4th edit. 1850. "*A Select Collection of Early English Tracts on Commerce*, printed by the Political Economy Club of London for private distribution, from the originals, supplied by Mr. M'Culloch, who also wrote the preface.

The value attached to these productions was shown by the number of editions through which several of them passed in England, and the reprints that appeared of them in the United States, and also by their translation into foreign languages. While he thus distinguished himself as a writer on political economy, and became a recognized authority on the subject, he still continued to retain his appointment as comptroller of H. M. stationery office, and the appreciation of his services in this department was shown by the rise in his salary, which increased by successive steps from £600 to £1200 per annum. He had also

a literary pension assigned to him of £200 per annum under the administration of Sir Robert Peel. In 1843 he enjoyed the foreign honour of being elected a member of the Institute of France. His library, especially in works connected with political economy, was remarkable both for its numerous and valuable volumes, of which he printed a catalogue raisonné for private distribution; while in private life he was as greatly distinguished by the extent of his knowledge derived from observation as well as books, and his readiness to impart it. He never also abandoned his connection with Scotland, and especially its capital, and once a year, during autumn, he was wont to visit Edinburgh, where his old friends were proud of the celebrity he had attained. At length, full of years and honour, John Ramsay M'Culloch died, November 11, 1865, at the age of seventy-five, leaving his widow, to whom he had been married in early life, and a numerous family of four sons and six daughters.

MACDIARMID, JOHN, a miscellaneous writer, was born in the year 1779. He was the son of the Rev. Mr. Macdiarmid, minister of Weem, in Perthshire. After studying at the universities of Edinburgh and St. Andrews, and acting for some time as tutor to a gentleman's family, he proceeded in 1801 to London, for the purpose of prosecuting a literary career. He soon obtained lucrative employment as a writer in periodical works, and became editor of the *St. James' Chronicle*, a newspaper in which some of the first scholars and wits of former years were accustomed to employ their pens. On the renewal of the war with France in 1802-3, the attention of Mr. Macdiarmid was attracted to the system of national defence which had been adopted, and he forsook his other employments to devote himself to a work of a very elaborate character, which appeared in 1803, in two volumes 8vo, under the title of *An Inquiry into the System of Military Defence of Great Britain*. He aimed at exposing the defects of the volunteer system as well as of all temporary expedients, and asserted the superiority of a regular army. His next work was an *Inquiry into the Nature of Civil and Military Subordination*, 1804, 8vo, perhaps the fullest disquisition which the subject has received. Being thus favourably introduced to public notice as a general writer, he began to aim at higher objects, but it would appear, without properly calculating his own physical capabilities. Mr. D'Israeli, who saw him at this time, and who had afterwards the melancholy task of introducing his case into the work called the *Calamities of Authors*, describes him as "of a tender frame, emaciated and study-worn, with hollow eyes, where the mind dimly shone, like a lamp in a tomb. With keen ardour," says the historian of literary disaster, "he opened a new plan of biographical politics. When, by one who wished the author and his style were in better condition, the dangers of excess in study were brought to his recollection, he smiled, and, with something of a mysterious air, talked of unalterable confidence in the powers of his mind—of the indefinite improvement in our faculties; and although his frame was not athletic, he considered himself capable of trying it to the extremity. His whole life, indeed, was one melancholy trial: often the day passed cheerfully without its meal, but never without its page." Under the impulse of this uncontrollable enthusiasm, Mr. Macdiarmid composed his *Lives of British Statesmen*, beginning with Sir Thomas More. For the publication he was indebted to a friend, who, when the author could not readily procure a publisher, could not see even the dying author's last hopes disap-

pointed. The work has obtained a reputation of no mean order. "Some research and reflection," says Mr. D'Israeli, "are combined in this literary and civil history of the sixteenth and seventeenth centuries." "The style," according to another critic, "is perspicuous and unaffected; authorities are quoted for every statement of consequence, and a variety of curious information is extracted from voluminous records, and brought for the first time into public view. His political speculations were always temperate and liberal. He was indeed in all respects qualified for a work of this description, by great power of research and equal impartiality." The poor author was destined to enjoy for a short time only the approbation with which his work was received. His health sustained, in November, 1807, an irreparable blow by a paralytic stroke; and a second attack in February, 1808, proved fatal, April 7.

M'DIARMID, JOHN. This talented journalist and popular writer in miscellaneous literature was the son of the Rev. Hugh M'Diarmid, minister of the Gaelic church, Glasgow, and was born, it has been said, in Edinburgh, in 1790. In the latter city also he received a respectable elementary education; but being deprived of his father in early life, he was obliged to make his way by his own energy and resources. His first situation was as a clerk in connection with a bleachfield at Roslin; afterwards he obtained a situation in the head-office of the Commercial Bank in Edinburgh, where he rose to a respectable position; and while thus employed in business during the day, he attended the university classes during his leisure hours, and diligently pursued a course of reading intermixed with the practice of composition. Of two advantages he also availed himself, which tended considerably to his intellectual improvement. One of these was acting occasionally as amanuensis during two years to Professor Playfair, from whom he obtained the privilege of attending his classes and the free use of his library; the other was his becoming a member of the Edinburgh Forum, where he was one of its leading speakers. It was with this forum also that the Ettrick Shepherd was connected, and from which, he declared, he derived more benefit than from any other source of instruction.

Although John M'Diarmid under such a training soon began to manifest a strong tendency to literature, he was too wise to let it drift him from his anchorage; and accordingly, while indulging in poetry and prose, and occasionally enjoying the luxury of seeing himself in print, he continued to retain his position in the Commercial Bank. It was well that he did so, as his disposition otherwise was generous in the extreme, and might soon have involved him in difficulties from which no amount of genius could have set him free. As a specimen of this, we may mention an incident that occurred in 1816. In the previous year, at the request of a fellow-clerk, he had written some spirited verses on Waterloo, when the foundation-stone of a monument commemorative of the battle was to be erected at Newabbey, near Dumfries; and the poem having brought him into some notice among the Edinburgh publishers, he was employed by the Messrs. Oliver and Boyd to compile some works for them, for which, when the task was finished, he received £50. This sum, independent of its "money's-worth," was a literary trophy, and therefore of double value: but before the cash had got warm in his pocket, he heard a moving tale of the distresses of a brother-poet still higher in the list of fame than himself, although

not nearly so fortunate. To relieve him M'Diarmid immediately transferred to him the whole amount, which, by the way, was never repaid.

Being now of some note in the literary world, and numbering some of its most distinguished among his associates, he, in conjunction with two friends, originated the *Scotsman* newspaper, the first number of which appeared in Edinburgh at the beginning of 1817. His connection with it however was merely a share of the copyright, which he retained for several years, the management of the paper itself being conducted by the two gentlemen who had at first been joined with him in starting it. He had already a literary undertaking in view that to him was more attractive than the divided editorship of a metropolitan journal; this was the entire editorship of the *Dumfries and Galloway Courier*, established in 1809 by the Rev. Dr. Duncan of Ruthwell, and conducted by him in reference to his benevolent schemes, especially the savings-banks, of which he was the founder in Scotland, and which held the chief place in the newspaper. The reverend doctor now retired from its management, and his place as editor was ably filled by John M'Diarmid, who succeeded to the office in January, 1817.

To this new position he showed himself so well adapted as to make it evident that he had got into his proper place. It was not merely in consequence of the excellence or variety of his literary talents, for others as liberally endowed in that respect had signally failed in the department of newspaper editorship. But he was a man of practical business habits as well as a man of genius, who, in conducting a journal, could manage it as a property, besides making it an exponent of certain classes of opinions. He was imbued with a love of agriculture and a thorough knowledge of its details, and therefore well fitted for the management of a newspaper in such an agricultural district as Dumfriesshire. His time moreover was entirely his own, so that the *Dumfries Courier* enjoyed his undivided care. These advantages were soon manifested in the changes it underwent, and its constantly growing popularity. Hitherto, with a leaning to what are termed liberal views, it had dealt little with politics; and was therefore wanting in what constitutes the soul of a newspaper. But M'Diarmid was out-and-out a liberal, who entered heartily into the measures of the party; and his able advocacy of the repeal of the test and corporation acts, Roman Catholic emancipation, the reform bill, and free trade, raised the *Dumfries Courier* from a peaceful neutral into an awakened power, which secured for it the leadership of country journalism, and won for itself a high place among the best newspapers of the day. While it thus animated and expressed the political opinions of the cottage fireside, his love of agriculture in its interests and pursuits was not less conspicuous; and in this important range he introduced an improvement which afterwards was wisely adopted by the journalism of the day. It was to write weekly reports on the agricultural state of the country; and these, instead of being dry details and lists of prices thrust into a corner of the paper as if they had no right to be there, were animated sketches, interesting description, judicious suggestions of improvement, and lively farming gossip, which all could read with pleasure, and many with profit. Sometimes, too, his good nature and love of the marvellous were abused by the communications sent to him of incredibly large gooseberries and gigantic turnips, which he announced in his reports as veritable facts; but while such delusions lasted, they gave increasing interest to the newspaper; and when they collapsed

or disappeared, his readers only smiled at their editor's kindly credulity, and loved him all the more for it. They well knew that he had never exaggerated, and would never exaggerate, wilfully.

The same spirit of benevolence which induced him to announce some choice production of Munchausen's garden made him alive to every tale that awakened his sympathies; and any incident that was moving or romantic, especially if it could stand the test of a strict but loving inquisition, he rehearsed in his best style in the columns of the *Dumfries Courier*. The following instance is given in the memoir of Mr. M'Diarmid written by his son. "About eighteen years before his death, a poor wandering female, carrying a baby in her arms, begged a night's lodging at a farm-house not far from Dumfries. She was sheltered in an outhouse, and in the morning the mother was found cold in death, and the living infant still clinging to her bosom. His heart was touched by such a tale. He related it simply and affectingly in his columns, and in the London papers, where it was copied, it met the eye of a lady of rank, then mourning the loss of an only daughter. She made inquiry if the little orphan was a female, and this happily being the case, she determined at once to adopt it. Though names were carefully concealed, that the child might never in after-life learn its origin, the most respectable references were given to the parish authorities, who gladly gave up the child; and being carried to London, she was baptized into the Church of England with much ceremony, and became one of the members of a fashionable family."

Although the prosperity of the *Dumfries Courier* attested so well the talents of the editor and the care he bestowed on it, Mr. M'Diarmid still continued to cherish that love of miscellaneous literature by which he had been first distinguished. This also, so far from being a hindrance, was rather a help, to his editorial labours. In 1817 he published an edition of Cowper's poems, prefaced by a well-written life of the poet; and the work was so acceptable, that it passed through several editions. In 1820 he published the *Scrap-book*—a collection partly of selected extracts, and partly of original contributions in prose and verse, which was soon after followed by a second volume. In 1823 he wrote a memoir of Goldsmith, for an edition of the *Vicar of Wakefield* which was published in Edinburgh. In 1825 he originated the *Dumfries Magazine*, which lasted three years (a long life, by the way, for a provincial magazine), and during its existence contributed several articles to its numbers. In 1830 appeared his *Sketches from Nature*, chiefly illustrative of scenery and character in the districts of Dumfries and Galloway, and consisting of a selection of articles that had previously appeared in the *Courier*. In 1832, when the *Picture of Dumfries*, an illustrated work, was published, his pen had contributed an interesting and well-written account of the ancient burgh and its locality; and his last separate production was a description of Moffat, and a *Life of Nicholson*, the Galloway poet. He thus, in the greater part of his works, drew attention to the antiquities and natural beauties of Dumfriesshire and Gallowayshire, and the adjacent counties of Kirkcudbright and Wigton: and these productions, while they formed the charm of his leisure hours, extended his literary reputation, and that of the newspaper with which he was connected.

In 1820 Mr. M'Diarmid was offered the editorship of the *Caledonian Mercury*, the first newspaper established in Scotland; but he was too comfortably situated in Dumfries to encounter the risk of bettering his condition. At the same time, the liberal

party in the county, alarmed at the idea of losing him, made arrangements by which he became a joint-proprietor of the *Courier*, and in 1837 it became wholly his own property. He was now so highly beloved in Dumfries, that, with the exception of Burns, no name was more endeared to the people, and this he had merited by his benevolence, his amiable manners, and the good which he had done by his writings to the county at large. In 1847 he was entertained at a public dinner in Dumfries by upwards of ninety of the principal inhabitants, Sir James Stuart Menzies, Bart., being president on the occasion. On the 12th November, 1852, he was attacked by erysipelas, which at that time was prevalent in the town, under which he died on the 18th of the same month, in the sixty-third year of his age. His death was universally lamented, and after his decease, as a fitting memorial, a sum of money was collected to found a bursary bearing his name for £10 annually in the university of Edinburgh, to be competed for by students from the three counties of Dumfries, Kirkcubright, and Wigton.

MACDONALD, ANDREW, a dramatic and miscellaneous writer, was born about the year 1755. His father, George Donald, was by profession a gardener, and resided at the foot of the broad way which connects Leith with Edinburgh, called Leith Walk; the place also of young Macdonald's nativity.

The subject of this memoir received the early part of his education at Leith, and went through the usual initiatory course of classical learning in the grammar-school of that town. Having exhibited early indications of superior parts, his parents and friends entertained the most sanguine hopes of his success in the world, and especially anticipated his attaining eminence in literature. With a view to his becoming a minister of the Scottish Episcopal communion, in which he was born and educated, they entered him a student in the university of Edinburgh, where he remained till 1775, when he was put into deacon's orders by Bishop Forbes of Leith, who became also his chief patron. On this occasion, at the bishop's recommendation, he prefixed the syllable Mac to his name, though for what reason is not stated.

Although now invested with the clerical character, there was yet no vacant living for him; but through the interest of his patron, the worthy divine just named, he procured the appointment of preceptor in the family of Mr. Oliphant of Gask, as a temporary employment and means of support, until a vacancy in the church should present itself. In this situation he remained about a year, when he was chosen pastor of the Episcopal congregation at Glasgow, in room of Mr. Wood, who had gone to St. Petersburg. His appointment took place in the year 1777. His patron, Bishop Forbes, having in the meantime died, he was put into priest's orders by Bishop Falconer. Although much addicted to literary pursuits Macdonald made no public appearance as an author for five years after this period, when he made a debut in the character of a poet, by publishing a poem, or rather part of a poem, entitled *Vilina, a Poetical Fragment*. Neither this work, nor a novel which he subsequently published under the title of the *Independent*, met with any remarkable degree of success. He therefore resolved to try his talents in dramatic composition; and his first effort was the tragedy of *Vimonda*, which was brought out at the Edinburgh Theatre Royal, for the benefit of Mr. Wood, with a prologue by Henry Mackenzie, and was received with marked applause by the public, though, like all the other works of its unfortunate author, it is now scarcely known to exist.

In the meantime Macdonald, who still resided at Glasgow, was making but little progress in worldly prosperity. His fortunes, notwithstanding the success of his play, which does not seem to have yet yielded him any considerable pecuniary remuneration, were rather retrograding than advancing. The Episcopal Church of Scotland was at this period in a very depressed state. The old members were fast dying out, and there were none to replace them. The result was that Macdonald's congregation was speedily reduced to a number so trifling, that he could no longer live by his charge. Thus situated he resolved on resigning it; and as no better prospects presented themselves elsewhere in the Scottish Episcopal church, he denuded himself altogether of his ecclesiastical functions, and finally threw aside even the outward sign of his calling, the clerical dress, and became at all points entirely secularized. On throwing up his ministry he came to Edinburgh, with, it would seem, pretty confident hopes of being able to make a living by his pen; an idea in which he was encouraged by the success of his tragedy. He had, however, before leaving Glasgow, taken a step which his friends thought fit to consider as at once imprudent and degrading. This was his marrying the maid-servant of the house in which he had lodged. His reception, therefore, on his return to Edinburgh, from these friends and those of his acquaintances who participated in their feelings on the subject of his marriage, had much in it to annoy and distress him, although no charge could be brought against the humble partner of his fortune but the meanness of her condition. Whatever question, however, might have been made of the prudence or imprudence of his matrimonial connection, there could be none regarding the step which he next took. This was his renting an expensive house and furnishing it at a cost which he had no immediate means of defraying, although, with all that sanguine hope which is but too frequently found associated with literary dispositions, he fully expected to be enabled to do so by the exertion of his talents. The result was such as might have been looked for. His literary prospects, as far as regarded Edinburgh, ended in total disappointment. His creditors became pressing, and the neglect of his friends, proceeding from the circumstance already alluded to, and which in some cases amounted to direct insult, continued as marked as when he first returned amongst them, and added greatly to the distress of mind with which the unfortunate poet was now overwhelmed.

Under the pressure of these accumulated evils he determined on quitting Edinburgh, and on seeking in London that employment for his literary talents which he could not find in his native capital. Having come to this resolution, he left his mother, for whom he always entertained the most tender regard, in possession of his house and furniture, and proceeded, accompanied by his wife, to the metropolis. Here his reception was such as to compensate in some measure for the treatment which he had experienced at home. The fame of his tragedy had gone before him, and soon after his arrival procured him many sincere and cordial, though it does not appear very powerful, friends. *Vimonda* was brought out with much splendour by Colman in the summer of 1787, a short time after its author had arrived in London, and was performed to crowded houses. In the following summer it was again produced, and with similar success. This good fortune operating on a temperament naturally sanguine, lifted poor Macdonald's hopes beyond all reasonable bounds, and filled his mind with the brightest anticipations of fame and independence. In this spirit he wrote

several letters to Mr. M. Stewart, music-seller in Edinburgh, the principal, if not indeed the only, friend he had left behind him, full of the most splendid ideas regarding his future fortunes. Having left Edinburgh in embarrassed circumstances, so that neither his house-rent nor his furniture had been paid, he promises speedy remittances to defray all his debts, and amongst the rest that which he had incurred to his correspondent, who seems to have managed all his affairs for him after he left the Scottish capital, and to have generously made, from time to time, considerable advances of money on his account.

"Thank Heaven," says the ill-fated poet in one of these letters to Stewart, in which he announces the good fortune which he now conceived was to be his for the remainder of his life, "thank Heaven, my greatest difficulties are now over; and the approaching opening of the summer theatre will soon render me independent and perfectly at ease. In three weeks you will see by the public prints I shall be flourishing at the Haymarket in splendour superior to last season. I am fixed for the summer in a sweet retirement at Brompton, where, having a large bed, and lying alone, I can accommodate you tolerably, and give you a share of a poet's supper, salads and delicious fruits from my own garden."

All this felicity and all these gay visions of the future were, however, speedily and sadly dissipated. In a few short months thereafter Macdonald sunk into an untimely grave, disappointed in his hopes, and reduced to utter destitution in his circumstances. That he did thus die is certain, but neither the immediate cause, nor the progress of the sudden blight which thus came over his fortunes before his death, is very distinctly traced in any of the memoirs which have been consulted in the composition of this article, unless the following remark, contained in an advertisement prefixed to a volume of posthumous sermons of Macdonald, printed in 1790, can be considered as an explanation:—"Having no powerful friends to patronize his abilities, and suffering under the infirmities of a weak constitution, he fell a victim, at the age of thirty-three, to sickness, disappointment, and misfortune." Macdonald died in the year 1788, in the thirty-third year of his age, leaving behind him his wife and one child, wholly unprovided for.

Macdonald made several attempts in dramatic composition subsequent to the appearance of *Vimonda*, but none of them were at all equal in merit to that performance, a circumstance which affords, probably, a more satisfactory elucidation of the cause of those disappointments which gathered round and hurried him to his grave, and embittered his dying moments, than those enumerated in the extract employed above. For some time previous to his death, under the fictitious signature of Matthew Bramble, he amused the town almost daily with little humorous and burlesque poems, after the manner of Peter Pindar's (Dr. Wolcot), and these were not unfrequently equal in point and satirical allusion to some of the most felicitous effusions of his celebrated prototype.

As a preacher he was distinguished for neat, classical, and elegant composition; qualities which procured a favourable reception for the volume of posthumous sermons published in 1790. A tragedy which he left in a finished state at his death was printed, and included in a volume of his poetical works published in 1791.

On the whole, Macdonald's literary talents seem to have been of that unfortunate description which attract notice, without yielding profit; which produce a show of blossom, but no fruit; and which, when

trusted to by their sanguine possessor as a means of insuring a subsistence, are certain to be found wholly inadequate to that end, and equally certain to leave their deceived and disappointed victim to neglect and misery.

It may be proper, before concluding this brief sketch of Macdonald, to advert to the account given of him by D'Israeli in his *Calamities of Authors*. That account is an exceedingly pathetic one, and is written with all the feeling and eloquence for which its highly distinguished writer was so remarkable; but unfortunately it is inconsistent in many parts with fact. What Mr. D'Israeli mentions regarding him from his own knowledge and experience, we do not question; but in nearly all the particulars which were not so acquired, he seems to have been egregiously misinformed. In that information, however, which is of the description that there is no reason for doubting, the following affecting passage occurs:—"It was one evening I saw a tall, famished, melancholy man enter a bookseller's shop, his hat flapped over his eyes, and his whole frame evidently feeble from exhaustion and utter misery. The bookseller inquired how he proceeded with his tragedy? 'Do not talk to me about my tragedy! Do not talk to me about my tragedy! I have indeed more tragedy than I can bear at home,' was his reply, and his voice faltered as he spoke. This man was Matthew Bramble—Macdonald, the author of the tragedy of *Vimonda*, at that moment the writer of comic poetry." D'Israeli then goes on giving the result of his inquiries regarding him, and at this point error begins. He represents him as having seven children. He had, as already noticed, only one. He says he was told "that he walked from Scotland with no other fortune than the novel of the *Independent* in one pocket and the tragedy of *Vimonda* in the other." The novel alluded to was published four years before he went to London; and *Vimonda* had been brought out at Edinburgh a considerable time before he left that city. D'Israeli speaks of the literary success which the "romantic poet" had anticipated while yet "among his native rocks." The reader need scarcely be reminded that Macdonald was born in the immediate vicinity of the Scottish capital, and that the whole of his life previously to his leaving Scotland was spent in the cities of Edinburgh and Glasgow, and great part of it in what has always been considered the profession of a gentleman.

MACDONALD, LIEUTENANT-COLONEL JOHN, F.R.S., F.A.S. This scientific soldier and voluminous writer possessed, by the mere accident of birth, a distinction which his productions in authorship, excellent though they were, would have failed to acquire; for he was the son of Flora Macdonald, that heroine whose name is so intimately connected with the romantic history of "the young Chevalier." All know the dangers she underwent, and the address she exhibited, in procuring his escape from his pursuers in 1746, and the enthusiasm which her romantic fidelity excited among the Jacobites of the day, after her exertions had been successful. She was the daughter of Mr. Macdonald, a tacksman or gentleman farmer of Melton, in South Uist; and in 1746, the period of her adventurous career, she was about twenty-four years old. After her return from London, whither she was summoned to answer for her political offence in effecting the escape of such an enemy, she married; but notwithstanding the rich gifts with which her generous conduct had been rewarded by the adherents of the Stuart cause in the great metropolis, she and her husband had become so poor at the time of Dr. Johnson's visit to her in

1773, that they had resolved to emigrate to America. This they afterwards did; but either having not succeeded to their wish, or finding the love of country too strong for voluntary exile, they returned to Skye, where Flora died on the 4th of March, 1790, leaving behind her a son, John, the subject of the present memoir, and a daughter, married to a Mr. Macleod, a distant relation to the chief of that name. "It is remarkable," writes Sir Walter Scott, "that this distinguished lady signed her name Flory, instead of the more classical orthography. Her marriage contract, which is in my possession, bears the name spelled Flory."

At an early period John Macdonald went to India, and on his way thither had occasion to reside for a short time in London. This was at a period when the alarm of the Jacobite war of 1715 and 1745 had ceased to be remembered, and when the Celtic dress had not as yet become familiar to the English eye. At this transition period the Highland costume of our young Scottish adventurer appears to have excited as much astonishment, and also displeasure, as the kaross of the Caffre or the sheep-skin of the Tartar would have done, had they been paraded upon the pavement of Cheapside. Writing of this event in the *Gentleman's Magazine* in 1823, he says, "I well recollect my arrival in London about half a century ago on my way to India, and the disapprobation expressed in the streets of my tartan dress; but now I see with satisfaction the variegated Highland manufacture prevalent as a favourite and tasteful costume, from the humble cottage to the superb castle. To Sir Walter Scott's elegant and fascinating writings we are to ascribe this wonderful revolution in public sentiment."

As it was to the scientific departments of the military profession that Macdonald devoted his labours, his career to the close was that of a studious observer and philosophic writer, rather than a stirring adventurous soldier. He passed many years in the service of the East India Company, and attained the rank of captain of engineers on the Bengal establishment. While thus employed, the important subject of the diurnal variation of the magnetic needle occupied much of his attention, and on this he made a series of observations in 1794 and the two following years, at Bencoolen, Sumatra, and St. Helena, which he communicated in 1798 to the Royal Society, who published them in their *Transactions*, and elected him a fellow in 1800. About the last-mentioned period he also returned to Britain, and was appointed lieutenant-colonel of the Royal Clan-Alpine Regiment, and commandant of the Royal Edinburgh Artillery.

After his arrival, the life of Colonel Macdonald was one of diligent useful authorship, so that his history from this period is best comprised in the titles of his works, and the dates of their publication. Of these we give the following list:—

In 1803 he published "*Rules and Regulations for the Field Exercise and Manœuvres of the French Infantry, issued August 1, 1791*." Translated from the French, with Explanatory Notes and Illustrative References to the British and Prussian Systems of Tactics," &c. &c. In two volumes 12mo.

In 1804, when he belonged to the 1st battalion of Cinque Ports Volunteers, and when every kind of military instruction was most needed for our home-bred soldiery while in training against the menaced invasion of the country from France, Colonel Macdonald published another work in one volume, entitled "*The Experienced Officer; or, Instructions by the General of Division Wimpfen to his Sons, and to all Young Men intended for the Military Profes-*

sion, being a Series of Rules laid down by General Wimpfen, to enable Officers of every Rank to carry on War in all its Branches and Descriptions, from the least Important Enterprises and Expeditions, to the Decisive Battles which involve the Fate of Empires. With Notes and an Introduction."

In 1807, while chief engineer at Fort Marlborough, he published *Instructions for the Conduct of Infantry on Actual Service*. This was also translated from the French, and published in two volumes, with explanatory notes.

In 1808 appeared his first work upon a subject which had employed his attention for years. This was *A Treatise on Telegraphic Communication, Naval, Military, and Political*, 8vo, in which he proposed a different plan from that hitherto adopted.

In 1811 Colonel Macdonald produced a work in startling contrast to his former subjects, but which was only one among the studies of a comprehensive philosophic mind, under the title of *A Treatise, Explanatory of the Principles constituting the Practice and Theory of the Violoncello*. This work was published in one volume folio.

In 1812, reverting to his military avocations, he published a translation of "*The Formations and Manœuvres of Infantry*, by the Chevalier Duteil," 12mo. This was the last of his productions in military science, and, as may be surmised from the date, the last that was needed—for the French science of warfare was now well understood by our armies, as their hostile instructors were learning to their cost. This fact, however, shows the judiciousness of the plan which Macdonald had adopted as an expositor of warlike science, and indicates in some measure the probable benefit with which his own individual labours were followed.

In 1816 Colonel Macdonald returned to the important subject of telegraph communication, by publishing his *Telegraphic Dictionary*, a laborious work, containing 150,000 words, phrases, and sentences. The estimate formed of the value of this work was shown by the directors of the East India Company, who voted the sum of £400 to assist in defraying the expense of publication; it was also highly recommended by the secretary of the admiralty and the adjutant-general of the army.

In addition to these separate productions, Colonel Macdonald was a contributor to the *Gentleman's Magazine* for several years until the close of his life; but the subjects of these essays are too numerous to specify. They were chiefly connected, however, with the philosophical studies which had occupied his attention from an early period, and were characterized by the philanthropy that had always animated his pen in seeking to promote the best interests of society. The same spirit was manifested in his personal exertions; and during the last twelve or fifteen years of his life, which were spent in Exeter, the charitable institutions of that city always found him an active co-operator, as well as liberal contributor. He died there on the 16th of August, 1831, aged seventy-two, and was buried in Exeter Cathedral.

MACDONALD, REV. JOHN, D.D. This pious, earnest, and devoted minister of the gospel, whose labours among his Celtic brethren of Scotland obtained for him the distinguishing title of the "Apostle of the North," was the son of James Macdonald, also a remarkable character and man of congenial spirit, who was a catechist in Reay, and who lived to the patriarchal age of ninety-five years. The subject of this memoir was born on the 12th of November, 1779, and the circumstances of his baptism were anything but apostolic. The pulpit of Reay being at that time

vacant, the catechist, on a cold winter-day of December, carried his child to the manse of a neighbouring clergyman, to have him baptized. The minister, however, had gone upon a shooting excursion, and as he was not expected to return before sunset, James Macdonald and his party left the manse, and were returning homeward when they met the clerical Nimrod in his shooting attire, and pursuing his sport upon a moor. On learning the purpose of their journey he resolved to make brief work of it; and, breaking the ice of a pool with the butt-end of his gun to get at the water, he sprinkled the child's face, and mumbled the words of consecration. In this way the "Apostle of the North" was made a member of the visible church.

The early acts of the young boy were distinguished by great vivacity of disposition, his love of music, and aptitude for making plays, which he acted with his companions; and these exhibitions of a buoyant reckless disposition were frequently alternated with thoughts of his father's serious admonitions and with acts of juvenile devotion. Even already his character indicated that his after-career would be no middle course, but one distinguished either for evil or for good. When nine years of age he was sent to the parish school, where in process of time he was distinguished as the cleverest of all the pupils, and acquired the favourable regard of his teacher, who taught him Latin gratis. This was more than the boy's father had intended, who designed that he should only have an ordinary education; but the schoolmaster, interested in such a promising pupil, carried him beyond the boundary, and was allowed to go on unchecked. Being now distinguished as a remarkably clever boy, John Macdonald was often employed by the neighbouring farmers in making up their yearly accounts, and an anecdote of one of these occasions he afterwards frequently related. It is thus told by his biographer:—"Being asked to make up the accounts of a farmer in a distant part of the parish, he was under the necessity of remaining for several days in his employer's house. The farmer had always kept up a form of family worship, though well known to be fonder of pence than of prayers; but he had never ventured, when on his knees, beyond repeating the words of the Lord's Prayer on any former occasion. Thinking it necessary to get up something *extra* when the catechist's son was present, as he knew him to be a sharp youth who would be sure to mark the difference between his prayer and what he was accustomed to hear at home, he resolved to paraphrase the form which had stood him in such good stead before, that it might be decently long at any rate. Beginning with the invocation, he added to it the words, 'and also on the earth,' and an eke to each of the first three petitions; but, having repeated the fourth, 'Give us this day our daily bread,' there was a long pause. He evidently seemed to feel that this was but a very scanty allowance to ask, so, with an earnestness in which he let out the deepest desire of his heart, he added, 'but if Thou wilt give us more, we are quite ready to receive it.'"

The services of the young Macdonald as an accountant so favourably recommended him to Mrs. Innes of Sandside, that she obtained for him a bursary to prosecute his studies at college. While he was staying at Sandside, he was sent with a letter to a neighbouring proprietor; but while discharging this commission a recruiting party came to the place, for the purpose of raising recruits in every possible way. The allurements of music and dancing were used, into which Macdonald enthusiastically entered. But while "the mirth and fun grew fast and furious,"

his majesty's bounty, in the shape of a shilling, had passed from the pocket of the sergeant into that of the young student, who was astounded next morning to find that he had become a pledged champion of the king. It was a military hocus-pocus of the period, by which raw lads were in a twinkling transformed into heroes without knowing how. Such interest, however, was used on the occasion, that Macdonald's engagement was cancelled, and he was left free to repair to the university, which he did in 1797. His love of music, so general among the whole Celtic race, has already been mentioned, and of all instruments, that of the Highlander is the bagpipe, which Macdonald loved and cultivated with national enthusiasm. His pipes were therefore carefully packed up with his books, and during his first year of college life their strains probably consoled him in the midst of his literary difficulties. But when he left home in the second year of his studentship, the serious subjects which now engrossed his attention made him leave the bagpipe behind. His father afterwards wrote to him to inquire what should be done with it, and the answer of the youth, who was now abjuring his idols, was, "Just what you think right." He well knew how this license would be interpreted. The worthy catechist, on receiving this reply, laid the Dagon of his son's late idolatry on the block, and with an axe hewed it to pieces.

At college John Macdonald was one of the most distinguished of the gown-class students, and in that of mathematics he was without a rival. His diligence in that science was illustrated by a curious instance of somnambulism. The professor of mathematics was accustomed to reserve, until near the end of the session, the most difficult of his problems; and as only a few of his students could solve them, or cared to risk such an ordeal, the class by that time had usually dwindled to a fragment. In a diminution of this kind John Macdonald at last found himself with only one class-fellow, and with a problem for the next day which, after all his evening attempts, he was unable to solve. He went to bed leaving the work unfinished—but what was his astonishment on waking next morning, to find a correct solution lying before him in his own handwriting! He was informed by his college chum that he had risen during his sleep, worked industriously upon the paper, and returned to bed after the task was ended. He took the solution to the class-room, and the professor found it quite correct. Such fortunate freaks of intellect, while the physical powers are dormant, sometimes occur among the wonders of psychology. A similar instance occurred to one of his own predecessors in the parish of Urquhart, who was a habitual somnambulist. He had engaged to preach a public sermon at Inverness; but after useless study on the previous day he was at last obliged to go to bed, after being unable to write a sermon, or even to find a text. Not long after he fell asleep his wife saw him rise, light a candle, sit down at his desk, and write for a long time, after which he extinguished the candle, and returned to his couch. In the morning he awoke, and his perplexity returned at having neither discourse nor text, when his wife told him that she could furnish him with both. "That can be of no use to me," replied the minister sadly, "if I did not myself select the subject, and compose the sermon." "But you have done both," replied his helpmate, and with that she produced the manuscript he had written, and told him the particulars of the night. He read the production carefully, and then said, "The text is suitable, and the skeleton is perhaps better than I could have written in my waking hours; but I was unconscious when I wrote it, and I

will not offer to the Lord that which cost me nothing." Rejecting this questionable aid, the conscientious man set off to Inverness, and on the way studied another subject, on which he preached with marvellous power and efficacy.

The abjuration by Macdonald, while a student, of his beloved bagpipe, is suggestive of a change in his character and feelings. And such had passed upon him, and transformed him into a new man. It was in the interval between two of his earlier college sessions that anxiety about his immortal welfare dawned upon him, and made him ask in earnest, "What shall I do to be saved?" This concern, acting so strongly upon such a lively excitable temperament, was probably occasioned by a perusal of the works of President Edwards, and Macdonald could obtain no rest until the momentous question was answered. His lonely walks for self-communion were frequent; but every repeated inquiry only deepened the obscurity and increased his doubt. It was a fearful probation, through which he was taught to minister to souls in similar affliction, and lead them to the remedy. His state and the deliverance that followed are thus recorded by his biographer:—"Shut up to Christ as his only resource by the felt desperateness of his case as a sinner, and by the authority of the command to believe in the Son, on the one hand; and on the other, shut out from him in darkness under the power of unbelief and in the impotence of spiritual death, well knew he then the agony of a soul lying without hope at the disposal of Him who will have mercy on whom he will have mercy, and who hardeneth whom he will. In this state of mind, as he himself once told the writer, he was walking one day by the sea-side. Under the pressure of despair, and at the suggestion of the tempter, he advanced within the sweep of the great billows that were breaking wildly on the shore. Ere the advancing wave had reached him, a ray of gospel light pierced the darkness in which his soul was shrouded. Rushing at once from the danger which he had rashly provoked, and climbing up into a quiet cave in the rock hard by, he was there and then enabled to commit his soul to Christ. He went to the shore that day in the grasp of the destroyer; he returned from it in the arms of the Saviour."

After a student life that was consistent with his profession, John Macdonald received license as a preacher from the presbytery of Caithness on July 2d, 1805. His first discourses in public, however, were below the mark, and after passing through the usual ordeal of popular criticism, they were pronounced too cold and formal, and unworthy of his father's son. He had not yet discovered where his strength lay, and his sermons, it was alleged, were too fastidiously composed and delivered, to be imbued with the necessary unction. Two months after being licensed, he set off upon an Ossianic tour through the North-western Highlands, at the urgent request of Sir John Sinclair, who was anxious to know whether the poems attributed to Ossian were veritable compositions, or only literary forgeries. The conclusions arrived at by Macdonald at the close of his investigation were such as are now generally accepted. There was such a poet as Ossian, and many of the poems attributed to him are genuine; but how much Macpherson may have increased them, or altered them, cannot now be ascertained. During this tour, however, our young probationer was not unmindful of his proper work, and preaching in every parish as he went along, he unconsciously trained himself for that career which afterwards procured for him the title of the "Apostle of the North."

That these incidental services were not unnecessary in the Highlands, where clerical zeal and intelligence were at a very low ebb, may be learned from an example of the minister of Glenelg. Macdonald having one day supplied the pulpit, the minister observed to him after the service was over: "That was a very good sermon, I suppose, but it was quite unsuitable here; for you spoke all day to sinners, and I know only one in all my parish."

Having officiated as a missionary for six months, Mr. Macdonald was ordained to the ministerial charge of the district of Berriedale in September, 1806. In the same year he married, although his income was both scanty and precarious, and at the close of 1806 he received a presentation to the Gaelic church in Edinburgh from the Society for Propagating Christian Knowledge, and was inducted into that charge in January, 1807. It was time indeed for him to obtain a transference; for, in the midst of the bustle of flitting from Berriedale, the day being very tempestuous, a whirlwind wrenched off the roof of his frail little cottage, and strewed the ground with its fragments. "There, John!" cried his father, who had come to assist him in removing, "I think it was high time to leave Berriedale!" The new Edinburgh charge into which Macdonald entered was neither simple nor easy. Those who composed the congregation were indeed Celts by birth; but, from a long residence in Edinburgh, they had almost ceased to be Highlanders, without becoming wholly Lowlanders. While some of them understood no sermon unless it was in Gaelic, several by disuse had almost forgot the language, while those who had been born in Edinburgh understood no tongue but the Scotch-English. To manage such a flock, also, was as difficult as the choice of the language in which to instruct them, for those who had thriven and become rich had also become arrogant, so that nothing less would satisfy them than being self-constituted chieftains to rule both minister and congregation. Even for a religious teacher who was willing to become all things to all men, no ordinary amount of tact and prudence, as well as gentle compliance, was necessary in such a charge, as by conciliating one party he was certain by that act to offend another. This Mr. Macdonald found to be the case, especially in the language of his preaching, for while English services were absolutely necessary, a majority of his hearers regarded it as a hostile tongue, and instruction conveyed in it as a positive insult. This difficulty he endeavoured to surmount by the double labour of being an English as well as Gaelic minister, and performing the duty of both, but giving the predominance to the latter. He accordingly preached two Gaelic sermons during the Sabbath-day, and an English discourse in the evening. In addition to these he held prayer-meetings and district catechisings, and delivered regularly a weekly lecture. He also periodically visited his people scattered over the extent of Edinburgh and its suburbs. And as his earnest diligence grew in the work, his eloquence as a preacher underwent a change for the better; for, in addition to the former distinctness and intellectual arrangement of his sermons, there was now a vitality and fervour imparted to them that winged them with force and conviction. "So marked," says his biographer, "was the change which then passed over him, that many were led to judge that he had never preached the gospel till then. This is entirely a mistake. He preached the gospel in Berriedale as surely as in Edinburgh, though with far less unction, discrimination, and power." Amidst all this labour, also, he was not neglectful of the duty of self-improvement; and in the literary society of Edinburgh,

as well as a careful perusal of the best writings of the period, he enlarged his knowledge and improved his facility in the command of English, which, being to him an acquired language, he had hitherto used with some hesitation and difficulty.

His popularity as a Highland minister being diffused over the Lowlands, the services of Mr. Macdonald were now in great request not only in Edinburgh, but in Greenock, Port-Glasgow, Dundee, and Perth, and frequently in Glasgow and Stirling, where Highland regiments of militia were stationed. These engagements and incessant demands upon his time, the natural result of clerical popularity, would have left him no leisure for study, had not a friend provided for him a "prophet's chamber," into which he could retire when the pressure from without was too great. Little do the frivolous know what thought and preparation must be given to the construction of a discourse for the pulpit, and how anxiously a conscientious minister will prepare himself for the task. This common mistake was expressed to Macdonald by a lady, when he proposed to retire to study. "Oh, sir," she said, "you can shake a sermon out of your sleeve any time you like." "Yes, ma'am," he replied, "but I must first put a sermon into my sleeve before I can shake it out."

After this change in the character of his sermons had occurred, Mr. Macdonald visited his father in Caithness; and while on his journey he preached in several places, and excited the astonishment of all his hearers. On his return from Caithness he arrived at Tain, where he was unknown, and was asked by Dr. Mackintosh, the highly popular minister of the parish, to occupy his pulpit on the ensuing Sunday. To this Macdonald agreed, and the congregation were indignant at seeing a stranger in the place of their own beloved minister. Among these was one who on that day had walked sixteen miles to hear the eloquent doctor—a feat to which he was often accustomed, and who thus described the services of that Sabbath:—"I was greatly disappointed on seeing Dr. Mackintosh walking towards the 'manse-seat,' and instead of him a smart-looking young man walking, as I thought, with too rapid progress, and with too light a step, towards the pulpit. I felt at once as if the day was lost. I expected no good, and shut up my heart against the youth who came in between me and my wonted Sabbath fare. He gave out the psalm. 'You can't spoil that, at any rate,' I said to myself. The prayer began; but I scarcely heard the first part of it. Gradually my attention was attracted, but towards the manse-seat I found my eye still wandering. Before the prayer was over I ceased to look away from the pulpit. When the sermon began I forgot all but the doctrine I was hearing. As he warmed up with his subject, the preacher became most vehement in his action; every eye was rivetted on the speaker, and suppressed sounds testified to the effect which his sermon was producing. His second discourse was so awe-inspiring that the audience became powerfully affected. Such was the awful solemnity of the doctrine and the vehemence of the preacher's manner, that I expected, ere he was done, every heart would be pierced, and that the very roof of the church would be rent. The sermon over, all were asking who the preacher was. 'A young man from Edinburgh of the name of Macdonald' was the only answer that could be given."

In 1813 Mr. Macdonald was translated from his Highland congregation in Edinburgh to Urquhart, being presented to that parish by Forbes of Culloden, the patron, on the petition of the parishioners. On account of the talents and popularity of Mr. Calder,

the previous minister of Urquhart, it was feared that his successor would appear at a disadvantage, but a short time sufficed to show the groundlessness of the apprehension; for, without abating their regard for their former pastor, they soon learned to prize the remarkable spirit of their new minister and his different style of preaching. It was a change indeed, but on the whole a change for the better, which they were both able and willing to appreciate. They had also been so well advanced under the ministry of Mr. Calder, that Macdonald could more amply engage in his beloved work as an evangelist among his countrymen at large. It was an instructor of this kind that was especially needed in the Highlands. Here and there, indeed, faithful and diligent ministers were to be found; but their number was small compared with those who regarded their charges merely as *livings*, and had entered office for a piece of bread. Remote from civilized society, and the wholesome superintendence of church-courts, they lived as idly or as dissolutely as they pleased, while of the flocks of such pastors it might be said, in the words of Milton—

"The hungry sheep looked up, and were not fed."

Selections from the sermons of such spiritual teachers would compose a jest-book of "very tragical mirth;" but instead of these, let the following instance of how a Highland pulpit might be occupied suffice. One minister during the Peninsular war, instead of preaching a sermon, brought occasionally a newspaper to the church, and read to the congregation an account of the various battles as the news arrived. On one occasion a false report of Napoleon's death had been published in the journals; and, eager to communicate glad tidings, the clergyman hied to the church on Sunday with his newspaper, and read the statement as it was there set down. Of course a later bulletin contradicted the statement, so that on the following Sunday he felt himself obliged to commence the service with the following remark:—"It was all lies I told you last Sabbath; Napoleon the scoundrel is yet alive."

During the first four years of his residence at Urquhart the extra parochial labours of Mr. Macdonald over Perthshire were frequent, inasmuch that he was noted as the Whitfield of the county; and although his own parishioners occasionally murmured at the length and frequency of these absences, they were as often mollified by his return, and the extraordinary diligence of his ministrations during each interval spent among them. These, indeed, were seasons of repose contrasted with his privations in traversing thinly-peopled districts where the highways were few, his readiness in preaching and teaching wherever a small handful of people could be collected, and the variety and number of his efforts as minister, missionary, schoolmaster, and catechist, every day of the week, and almost every hour of the day. And still as public attention to the calls of religion was excited, and conversions effected by such visitations, the sluggishness of the parochial incumbents, whose work was thus done by a stranger, could not fail to provoke the inquiry and condemnation of their people. It was a provoking contrast, under which many a Highland minister writhed, and they attempted in many cases to exclude him from their parishes, after locking their church-doors against his entrance. On one occasion, when he besought the use of the pulpit for a week-day, the minister refused with, "No, the command is, 'six days shalt thou labour,' which shows that preaching should be confined to the Sabbath." Another minister, who had allowed Macdonald to preach in his pulpit, and was

blamed by his brethren for the toleration, honestly justified himself by the following answer:—"I think we might give our people a treat now and then, when they put up with our gibberish all the rest of the year." On one memorable occasion, having been solicited by the parishioners of Dornoch to preach to them, Mr. Macdonald consented, provided leave could be obtained from the minister of the parish. This, however, was withheld, so that when Macdonald arrived, the church was closed. The adjacent parish of Creich, however, was not tabooed by clerical restriction, and he adjourned to Spinningdale, where Creich touches the west boundary of Dornoch, and there commenced the public religious service, while the Dornoch people sat opposite upon their own soil. And never had he preached with greater fervour or power, while the spot on which he stood was worn down by the action of his feet into a pit, the form of which was pointed out to visitors many years after.

The hostility of the Moderate party in the Established church against their opponents, whom they characterized by the title of "wild men," had now concentrated with tenfold strength against Mr. Macdonald, or, as he was now termed, "the wild man of Ferintosh." He was no longer to be allowed to turn the Highlands upside down, and vex the repose of its peaceful parishes, or the still more valuable repose of their ministers, by his unseasonable visits. A pretext, also, was given for his trial at the ecclesiastical tribunal by his proceedings in the notable district of Strathbogie. Pitying its destitute spiritual condition, he had often wished to preach there, but was as constantly opposed by the parochial clergy, until, hopeless of overcoming their obstinacy, he at last preached in a dissenting chapel within the bounds of their presbytery. This was in the year 1817, and as his act appeared to be a trespass which the laws of the church had denounced, the case was brought before the General Assembly. After a long discussion in that highest of church-courts the following motion was made and carried by a large majority:—"Having considered the references, the Assembly declare, as it is hereby declared, that the performance of divine service, or any part of public worship or service, by members of this church in meeting-houses of dissenters, is irregular and unconstitutional, and ought on no occasion to take place, except in cases in which, from the peculiar circumstances of a parish, its minister may find it occasionally necessary for conducting the ordinary religious instruction of his people; and the Assembly further declare, that the conduct of any minister of the church, who exercises his pastoral functions in a vagrant manner, preaching during his journeys from place to place in the open air, in other parishes than his own, or officiating in any meeting for religious exercises without the special invitation of the minister within whose parish it shall be held, and by whom such meetings shall be called, is disorderly and unbecoming the character of a member of this church, and calculated to weaken the hands of the minister of the parish, and to injure the interests of sound religion; and the Assembly enjoin presbyteries to take order, that no countenance be given by ministers within their bounds to such occasional meetings proposed to be held for divine service, or other pious purposes, as may, under the pretext of promoting religion, injure its interests, and so disturb the peace and order of the church; and, in case of such meetings taking place, the presbyteries within whose bounds they are held are enjoined to report the same to the meeting of the General Assembly ensuing." A stop must be put to the evangelistic invasion of

parishes—no matter how destitute their spiritual condition, or how careless or inert their ministers, and the present motion provided for their defence in all time to come. But where the while was the condemnation of the culprit by whose deeds this discussion had been provoked, or the sentence of suspension or deposition which might have been expected to follow? This essential was strangely omitted, so that, while the offence itself was punished, the offender was allowed to go free. Upon this inconclusive conclusion the following remarks were made by the Rev. Dr. Andrew Thomson, in the pages of the *Christian Instructor*:—"The references which gave rise to the decision accused Mr. Macdonald of Urquhart of irregular practices in the function of preaching. It was his conduct which these documents stated to be the ground of the application. It was his conduct which every one of the speakers in supporting them made the subject of their animadversion. And it was his conduct which the motion, in its original form, as concocted (shall we say?) at Aberdeen, was intended to censure and condemn. But every person who had the misery to be present when the matter was reasoned, must recollect how Mr. Macdonald's conduct was, in the course of the debate, so completely vindicated, that not even the most fierce and unreasonable of his opponents could persist in their primary determination to find him guilty. Every one seemed to vie with another in declaring that he was not only a good man, and a useful minister in general, but quite innocent and blameless in the particular examples brought forward to his prejudice. And accordingly the sentence found no fault with him—did not even mention his name—no, nor made the remotest allusion to anything he was alleged to have done. How ridiculous, then, is the sentence!"

We now pass onward in the course of our narrative to the year 1822, when Mr. Macdonald visited the island of St. Kilda. This solitary spot in the Atlantic, where it stands like a fragment broken off from the mainland, and cast aside as useless, was at this time inhabited by 108 persons, who occupied a little village built like a Hottentot kraal, and where they lived in somewhat of the Hottentot fashion. Their chief wealth consisted of solan geese, with the feathers of which they paid their rent, and occasionally procured a few extra comforts; and their chief subsistence was a few cows and a small breed of sheep, whose wool supplied them with clothing. Their principal excitement as well as occupation arose from the capture of the solan geese that inhabited the ramparts of rocks by which their dismal isle was walled out from the world, and the incredible daring with which they war with these birds in their nests, being suspended for the purpose in mid-air by a slender rope held only by a single person, and relying on which they swing themselves from cliff to cliff, where, by the slightest failure of eye or nerve, they would lose their hold, and be dashed in pieces on the rocks beneath, or drowned in the ocean—are everyday feats in the lives of these poor Kildaites. Macdonald had often thought of them, and now he was to visit them by an express commission from the Society for Propagating Christian Knowledge, and, with the consent of the minister of Harris, who, although St. Kilda was in his parish, had never visited it. This difficult and dangerous voyage was to be performed in the company of the tacksman of the island; and at sea between Harris and St. Kilda Macdonald expressed his affectionate longing for the people by a burst of Celtic poetry, in which he longed for the wings of a dove, that he might speedily be with them. As he neared his destination, he soon per-

ceived that his undertaking was only suited for missionary enterprise, and he thus wrote in his journal:—"At last I caught sight of the island, a sight I had longed to see, and my heart swelled with gladness as I looked. But who could look on that island, standing erect out of the sea, with its rugged, craggy rocks, and its waste, unlovely mountains, its rough, green shore, the rude proud billows of the sea indenting all its sides as they dash against it with furious onsets, while it stands unyielding to the surf that is raging all around it, though its brow is bare and hoary with the waste and the spray of the waves; who could see it thus, and unbidden venture to approach it! Truly, if I had not a call from the Lord, I would not set foot on its shore."

On disembarking at the only spot which formed the landing-place of that rock-bound island even for a boat, Macdonald found that he had suddenly passed from storm, tempest, and the risk of shipwreck to a calm, genial, moral atmosphere, in consequence of the gentle simple manners and affectionate welcome of its people. They had still retained among them a scanty portion of their early Christian education, such as it had been; but happily it was sufficient to increase not allay their thirst, and make them eager for more. On being introduced to Mr. Macdonald as a minister sent to them by the Society for Propagating Christian Knowledge, these primitive people shook hands with him as if he had been an old-established friend, and said, "God bless the society which sent him; and God bless him for coming!" The work of preaching was commenced without delay, the only barn in the village sufficing them for a church, and a summoning cry for a church-bell; and with preaching was connected pastoral visiting and catechising, which were performed in houses, or in the fields wherever a group of people were collected together. "I feel," he said, "that I ought to let slip no opportunity of doing so—that I am in a manner accountable for them in the day of the Lord—and that ere another messenger may visit them, there is every mortal certainty that some of those I now see will be in eternity." As most of the people could not read, and as the greater part of their Christian knowledge was merely traditional, much of Mr. Macdonald's teaching was of matters about which they had never heard, or only heard imperfectly; but his instructions were conveyed with such fervent simplicity as found an entrance into every heart. They could never hear enough; and on one evening when it was feared that the lamps of their meeting-place would not burn at night, in consequence of the boisterous wind, the active young men immediately set about repairing the roof of the barn, which they did effectually in half an hour, declaring, "There shall be sermon indeed, and we shall not lose a single night."

After a stay of ten days in St. Kilda, during which he had preached thirteen times, irrespective of his other apostolic duties, Macdonald found himself obliged to return with the tacksman, in whose boat he had come to the island. All wept when his approaching departure was intimated; and when he descended to the beach to embark, the whole population of the island—men, women, and children—accompanied him to the shore, and bade him farewell amidst cries and tears. Such was the parting of these simple children of nature—men whose brave hearts no dangers could daunt, but which were also filled with the tenderness of women. It was no wonder that ever afterwards Macdonald remembered this *Ultima Thule* of his apostolic wanderings and its primitive inhabitants, who were so utterly concealed from the world, with a more than ordinary

interest and affection. Under this feeling he revisited St. Kilda in the following year, and no sooner did his bark heave in sight than all the islanders rushed joyfully to the shore to welcome him. "We had no sooner effected a landing," he writes, "than they all pressed around me, and grasped my hand each in his turn, when I thought they would have wrung the very blood out of it. Few words passed for a minute or two, but tears trickled from every eye. I was overcome myself." When this tumultuous outburst of affection had subsided, he adds, "At last silence broke, and says every one here and there, 'This is a surprise: this is more than we looked for! We little expected to see his face again. God bless him for this visit. He will bless him whatever becomes of us.'" The sacred uses of the old barn were resumed, and he stated to them that, besides meeting them for public worship once a day in the evening as formerly, he should hold a morning religious service for prayer and praise, and the reading and exposition of Scripture, should the nature of their occupations permit. To this they joyfully assented, exclaiming, "We can easily manage our other business, and what is everything else to this?" Having such a willing people, most of the difficulties that encounter missionary labour were removed; and as a Gaelic school had been established in the island since his former visit, several of the young could read the New Testament and some portions of the Old. Their gratitude also to their religious instructor was expressed in a manner which, however trivial or odd to civilized estimation, was truly noble, considering their scanty means. Every morning, as soon as the island dairy-maids had returned from the milking on the hills, they presented abundance of warm milk to Macdonald and his friends, saying, "He gives us the great good, and why should we not give him the little—little indeed, in comparison with what we receive?" But this was not enough, and, on having called a public meeting to deliberate what present they could give to the kind minister, they agreed to bestow upon him their best, which was a good fat wedder. During this stay of nearly three weeks at St. Kilda Mr. Macdonald was gratified to witness the religious improvement that had taken place upon the people, and the diligence with which they had turned all his instructions to their proper account. But again there was to be a melancholy parting, and no sooner had he announced the passage in Romans xiv., which was designed as the text of his farewell sermon, than his audience at once perceiving the application burst into tears, while the women lamented with cries and sobs. It told them that he was going indeed, and as formerly they accompanied him weeping to the shore, and afterwards ascended to the top of their highest hill, and gazed upon his receding bark, until it had vanished from their view.

After returning from his first visit to St. Kilda Mr. Macdonald was invited to become minister of the Gaelic chapel, Edinburgh, with a stipend of £400 per annum; "but though the translation," he said, "might be desirable for the sake of a rising family, how could I part with dear Urquhart?" In the following year, 1823, he was invited by the London Missionary Society to preach their anniversary sermon in May, with which invitation he complied, and on reparing to the vast capital of Great Britain he found himself in a new world, and among a strange people, of whom he had hitherto heard only by report. But even there he employed himself in his wonted evangelistic work, and had soon more invitations to preach than he could accept. It was after his return that he paid his second visit to St. Kilda. In 1827 a new

field was opened to his spirit of apostolic enterprise. Mr. Daly, then rector of Powerscourt, and afterwards Bishop of Cashel, being anxious that the gospel should be preached to the Irish in their native tongue, had applied to Scotland for a Gaelic evangelist, and the choice of the Scottish clergy for such a service naturally fell upon Macdonald. Having accepted the commission and mastered the Erse language, of which his own was a dialect altered by the lapse of 1400 years, he went to Dublin, and commenced an evangelistic tour which comprehended the towns and villages of a large portion of the green island. He preached almost every day, and while his use of the Irish language by such constant practice was always becoming more easy, he was soon able to preach to the natives with all that eloquence and fervour which had distinguished his addresses to the Scottish Highlanders. The effect of such preaching was shown by many of the Irish repairing, like Nicodemus, by night to hear him, not daring to do so by day from fear of their clergy. But the great difficulty of his sermons in effecting conviction and instruction arose from the ignorance of the people, who were forbid by their priests to read the Bible. Not content also with this safeguard of ignorance, and alarmed at the crowds who assembled to hear the heretic preacher, they employed smart fluent speakers to address the people in refutation of the arguments adduced in the sermon. But Macdonald's preaching had not only such unexpected antagonists, but also unexpectedly as strong supporters. On one occasion, when preaching upon the parable of the good Samaritan, he said, "I am not to inquire at present why the priest passed the poor man by." At this, up bolted a raw Irishman in the congregation, with "Plase your Rivirence, I can tell you why the prait passed him by." "I shall be glad to hear it," said the preacher, "if you can tell." "And that I can," cried the other; "it was because he knew that the thieves had left no money in his pocket." The poor fellow had some cause for this bitter conclusion, as the priests had lately wrung from him his last penny, for burying his wife and saying masses for her soul.

After an active and useful tour in Ireland Mr. Macdonald on his return bestirred himself for his poor Kildaites, who had never been absent from his thoughts; and after preaching over the length and breadth of Scotland for the purpose, he was enabled to collect sufficient funds for the erection of a manse and church in St. Kilda. The buildings being completed and a minister appointed, Macdonald accompanied him to the island in 1830, and introduced him to his flock. The poor islanders could scarcely believe their eyes when they thus saw the realization of their highest wishes, and their gratitude to Macdonald, by whose instrumentality the change had been accomplished, made them almost speechless. During this visit he also preached in the islands of South Uist and Pabbay, in which the majority of the inhabitants were Roman Catholics, and sunk in religious ignorance and apathy. His ministrations, however, roused them to inquiry about their spiritual interests, by which both Protestants and Roman Catholics appeared to be benefited alike. On one occasion, when he had preached at South Uist, and was about to dismiss the congregation, fifty or sixty persons, who either lived at a distance or had not received the notice in time, unexpectedly arrived. Macdonald expressed his regret that they had come so late, and that should he begin a new service, the patience of his recent audience would be exhausted. "No, no," cried one of them, "you will not tire out our patience, though you should continue till midnight." A new service commenced, and no symptom

of weariness appeared. At the dismissal of the congregation one of the audience was overheard to exclaim, "What wonderful doctrines are these we heard to-day!" "Wonderful indeed!" replied his neighbour, evidently a Roman Catholic; "and when would our priest give us such doctrines?" "Indeed," said a third, in the earnest metaphorical style of the Celts, "his words made holes through my heart!"

In presenting a view of the daily, weekly, and yearly life of the Highland Whitfield, the following summary given by his biographer is too important to be omitted. It gives us a picture of apostolic zeal and activity, such as modern times can too seldom exhibit. "On Sabbath, when at home, he always delivered three sermons. Once a month he preached regularly in Inverness and in Dingwall, and for a considerable time stately in Invergordon. In not a few places he was invariably present on communion occasions, usually preaching every day; besides giving to many ministers occasional and more limited assistance. He often went on excursions to various parts of the Highlands, preaching as he went. During three months of each year he preached on an average two sermons a day; and in no year of his life in Ross-shire did he preach fewer than 300 sermons. He preached upwards of 10,000 times during the last thirty-six years of his life, and never delivered an unstudied discourse. This was not owing to his confining himself to a set of sermons which he constantly repeated; for he has left among his papers skeletons of discourses on almost every text on which a sermon could be written, besides notes of lectures on the Gospels and other parts of Scripture."

In a life of so much travel, at all hours and in every kind of weather, not only the frequent hardships and privations, but the usual risks to life and limb, were cheerfully encountered, and bravely endured. In a swollen river which he had to cross he and his horse were stranded, and would there have been drowned, had not both been pulled out by ropes thrown across by people who had assembled on the river's bank. On another occasion, when travelling to Auldearn on a winter's night to preach, Mr. Macdonald was suddenly pounced upon by two men—one of whom laid hold of his horse's bridle, and the other of his right arm, while they demanded his purse and watch with the usual threat for refusal. The minister coolly observed in reply, "This was not the reception I expected on coming to preach at Auldearn." "This is Macdonald!" cried one of the scared footpads to his companion, "we had better let him alone"—and with that they disappeared as quickly as they had started up.

In one of his journeys he caught a severe cold, but as he persisted in his work instead of waiting for the means of cure, the pores of his body closed, and the disease became dangerous. Knowing that nothing but a copious perspiration would cure him, for obtaining which the usual medicine was now found useless, his friend Hector Holm, a Highland Esculapius, thought he had hit upon the right plan to effect it. He privately sent intimation to the nearest houses that Mr. Macdonald was going to preach, and when the people were assembled in the kitchen of the house, he told Macdonald the purpose of their meeting. The minister declared, that in his present state he was unable to preach; but his objections were overruled by the pertinacious Hector, who represented that it would be very hard to send away the poor people without a word, and suggested that he only needed to sit in bed wrapped up in his blankets, and read and expound a passage of Scripture, while the people would listen outside the door

in the passage. On these easy terms Macdonald agreed, but he had not well entered into his subject, when, as his counsellor had foreseen, his wonted ardour in preaching came upon him, his few words became an eloquent elaborate lecture, and at the end of it he was covered with perspiration. He was then muffled up in the bedclothes, and after a sound sleep he awoke in the morning freed from all complaint. Holm valued himself not a little upon a remedy so well adapted for such a patient, although perhaps he was not aware that the original merit of the discovery belongs to Rowland Hill. It was a saying of that eccentric divine, "There is no cure for a minister's cold equal to a good pulpit sweat."

Another evil to which Macdonald's course of life exposed him arose from the jests and gibes of the profane, which to a sensitive mind are generally more painful than any bodily infliction. But he, too, when there was need, could utter such pungent jokes, that wittlings often thought twice before they measured wits with him. Not a few good *mots* could be selected illustrative of the keen but well-regulated hilarity of the "Apostle of the North;" but, passing over these, we shall content ourselves with the following incident, in the words of his biographer:—"While crossing Kessock ferry along with the minister of Killearnan, among their fellow-passengers was a drunken exciseman, at whose feet a dog was lying. The gauger, observing the ministers, raised the dog, and holding it in his arms, went up to Mr. Kennedy, and said, 'Will you christen this child?' Mr. Kennedy, horrified, at once ordered him away. He then presented the dog to Mr. Macdonald, who immediately rose up and said, 'Do you acknowledge yourself the father of what you now present for baptism?' The exciseman, drunk as he was, saw that he was caught in his own snare. Looking wildly at the ministers, he flung the dog into the sea, and skulked back to his seat amidst the jeers of all who were on board."

While those events were going on which finally ended in the entire severance of the Church of Scotland into two separate churches, the party to which Macdonald adhered, and the church with which he was to be finally identified, were matters of no doubtful question: hitherto he had acted wholly with the intending out-goers, and his labours over the Highlands had greatly aided in preparing that remarkable accession of Highlanders who joined the exodus. When the controversy, therefore, was at its height, and the Disruption inevitable, he was one of the men of foremost mark in the preliminary events that took place. But it was just at that critical period that an accusation was brought against his character, which, if established, would not only have annihilated his present influence, but blasted all the reputation of his former life. It was a charge, the most damaging of all that can be brought against the clerical character. A wretched woman, unmarried, who had followed him from place to place in his religious itinerancy, had sought many interviews with the unsuspecting minister, and been regarded by him and many others as a sincere follower of the gospel, became the mother of a child, and anxious to grace her shameful fall, if she could not conceal it, she charged the paternity first upon an eminent Christian layman, and afterwards upon Mr. Macdonald. A calumny so foul and unexpected was answered by Mr. Macdonald with an instant demand for a trial of the case before the presbytery, and after a searching investigation his innocence was completely established. In 1842, the same year in which this distressing annoyance occurred, Mr. Macdonald received the diploma of D.D. from the university of New York, America.

When the Disruption at last occurred, Dr. Macdonald went out with the Free Church, but not alone; and the number of Highland congregations who followed his example was the fruit of that diligence with which he had prepared them for such a consummation. On being obliged to resign his manse, he first removed to a small cottage in the neighbourhood, afterwards to a larger and more comfortable residence, and finally to the Free Church manse which was built at Urquhart, where he spent the last three years of his life. In 1844, when a meeting of the General Assembly of the Free Church was held at Inverness, he was appointed its joint-moderator, with the Rev. Dr. Macfarlane of Greenock, as representative and interpreter for the Highland speaking part of the assembly. Before the commencement of its proceedings he also preached a Gaelic sermon, the text of which, as soon as commenced, provoked a smile from the Highland portion of his auditory; and when the Lowland hearers turned to their English Bibles, they found that he had chosen the following verse for his discourse, "And these who have turned the world upside down are come hither also." The text had been applied by the Highland Moderates to this Inverness assembly, and Dr. Macdonald returned it to them with interest, by the use which he made of it in justifying the Free Church's proceedings.

Being now an old man, the doctor, after such a laborious well-spent life, might justly have retired to the shade, and sought repose; but his mind was as active and enterprising as ever, and his physical frame robust and capable of much endurance. With him, to live was to work, so that life and labour could only terminate together. A new cause was also to be built up, in which he had been a diligent influential workman, and he could not desert it now when it was most in need of aid. His itinerant labours were therefore continued after the Disruption as busily as before, and comprised a large amount of travelling both in the Highlands and Lowlands. In 1849, as if he had felt a premonition that the end of his career was at hand, although no symptom of decay as yet appeared, he preached repeatedly from the text, Eccles. ix. 10: "Whatsoever thy hand findeth to do, do it with thy might; for there is no work, nor device, nor knowledge, nor wisdom in the grave, whither thou goest." It was on this text, also, that he preached his last sermon in the Free Church of Kiltarn.

The immediate cause of Dr. Macdonald's death was occasioned by an apparently trivial accident. His foot had been blistered by an uneasy boot, but, regardless of the inconvenience, he continued to travel and preach as before. At last he became so lame that application to medical aid was necessary; but mortification had already set in, and on a medical consultation being held, the propriety of amputating the foot was suggested among the means of cure. But no sooner was this whispered than some scores of stalwart Highland admirers of Dr. Macdonald, each armed with a stout cudgel, mounted guard over the house where the surgeons were assembled, and threatened with grievous pains and penalties all who should attempt any such experiment upon their venerated pastor's limb. The plan of amputation was abandoned, and excision of the mortified part of the foot adopted; but the operation was useless, as the virus had passed into his system. Death was inevitable, but this the venerable apostle contemplated as a happy entrance into his proper home. Many were the edifying declarations which he uttered to his friends on his death-bed, which they treasured up for affectionate remembrance, and among these

was the following to a minister who visited him:—"There are three things which the Lord hath done for me; and may you have cause to praise him for dealing so with you. He did not expose my heart-sins to the world; he did not punish my secret sins in my public work; nor did he alienate from me the affections of his people during all my ministry." Even when delirium supervened before his decease, Dr. Macdonald's ruling passion was expressed in praying and preaching as if he had been at his wonted work with a congregation before him. Thus he continued until his death, which occurred on the 18th of April, 1849.

Dr. Macdonald was twice married, his second marriage having occurred in 1818. He had ten children, of whom three were by his first marriage, and six are still alive. His eldest son, John, his first-born, as well as his best beloved, who resembled himself in character and pursuits, after studying for the church, became for a short time minister of River Terrace Scotch Church, London; but having in early life devoted himself to the work of a missionary, he went out in that capacity to India, and there died in the midst of his missionary career in 1847. His aged father received the mournful intelligence by letter while upon a preaching tour in Perthshire, and on his way to preach at Glenlyon; but, being intent on his work, he put the letter unread into his pocket, and did not remember it until next day, when he was on his way to Edinburgh. It was the heaviest of his calamities, the greatest of his bereavements; but after he had lamented as a father, he was enabled to rejoice as a Christian. On returning home he took for his text, "It is well;" and on applying the words to his son's death, he said, "It is well that he was educated; it is better far that he was born again; it is well that he was licensed to preach the gospel; it is well that he was ordained as a pastor; it is well that he went to India; and, above all, it is well for him that he died; for thus, though away from us, and 'absent from the body,' he has secured the gain of being ever with the Lord."

M'GAVIN, WILLIAM, a modern controversial and miscellaneous writer, was born August 12th, 1773, on the farm of Darnlaw, in the parish of Auchinleck, Ayrshire, which his father held on lease from Lord Auchinleck, and afterwards from his son James Boswell, the biographer of Johnson. A short attendance at the school of that parish, when about seven years of age, constituted the whole education of a regular kind which the subject of this memoir ever enjoyed. His parents having removed in 1783 to Paisley, and being in by no means affluent circumstances, he was sent at an early period of life to earn his bread as a draw-boy in one of the manufactories. Subsequently he tried weaving of silk, but eventually was led by his taste for reading to become apprentice to Mr. John Neilson, printer and bookseller—a situation highly congenial to his taste, and which afforded him the means of cultivating his mind to a considerable extent. Among various persons of talent and information who frequented Mr. Neilson's shop was the unfortunate Alexander Wilson, poet, and afterwards the distinguished ornithologist, who, finding it necessary to remove to America, was assisted to no small extent by Mr. M'Gavin. The popular opinions of that period were adopted in all their latitude by Mr. M'Gavin; many fugitive pieces by him upon the question of parliamentary reform and other exciting topics were received with approbation by those who professed similar sentiments; but it is not known that he took any more active part in the politics of the time.

The duty of reading proof-sheets in his master's shop was the circumstance which first led Mr. M'Gavin to study the English language carefully; and, considering the limited nature of his education, it is surprising that he should have been able to attract notice as an author under the age of twenty.

In 1793, having left Mr. Neilson's shop, he was found qualified to assist his elder brother in the management of a school where writing, arithmetic, and mathematics were taught. Of this seminary he afterwards became sole master; but he ultimately abandoned teaching as a pursuit not agreeable to his genius or temper, and in 1798 was engaged as book-keeper and clerk by Mr. David Lamb, an American cotton merchant, to whose two sons he at the same time acted as tutor. Some years afterwards, on Mr. Lamb removing to America, Mr. M'Gavin became his partner; the business was carried on in Glasgow. In 1805 Mr. M'Gavin married Miss Isabella Campbell of Paisley. As his business was of a light nature, and Mrs. M'Gavin brought him no children, he enjoyed more leisure for the cultivation of his mind than falls to the lot of most merchants in the busy capital of the west of Scotland. At a later period, after the death of his original patron, he entered into partnership with the son of that gentleman, and carried on what is called a West India business under the firm of M'Gavin and Lamb. This ultimately proving unprofitable, he was induced in 1822 to undertake the Glasgow agency of the British Linen Company's bank, which he conducted without intermission till his death.

Mr. M'Gavin was brought up by his parents in the strictest tenets of the Presbyterian faith, as professed by the congregations of original Anti-Burghers. About the year 1800 a conscientious dissent from the views of this body respecting church government induced him to join the Rev. Mr. Ramsay in the formation of an Independent or Congregational church. In this communion he began to exercise a gift of preaching, with which he was endowed in a remarkable degree, receiving from Mr. Ramsay the ordination which was considered necessary for the pastoral office by this body of Christians. Eventually, circumstances so much reduced the society as to make it cease to answer what he conceived to be the design and use of a church—namely, "not only the edification of its own members, but the public exhibition of their spirit and practice for manifesting the glory of the grace of God, and promoting the salvation of men." For this reason, in 1808 he joined the kindred congregation of Mr. Greville Ewing in the Nile Street meeting-house, Glasgow, where he was soon afterwards invested with the office of deacon. Here he might have also continued to preach if he had been willing; but he was now unable, from the pressure of business, to give the duty that attention which he deemed necessary, and accordingly resisted Mr. Ewing's frequent and urgent solicitations, though he occasionally consented to perform public worship in the neighbouring villages, or in places where he thought such ministrations eminently necessary.

Being a man of uncommon industry, and equally great benevolence, Mr. M'Gavin found time, amidst his numerous mercantile avocations, to write a number of religious tracts and stories for the improvement of the poorer and junior classes of society. Though these productions are of a class which do not usually attain a high place in literature, no reader, however indifferent to the subjects, or of however highly cultivated intellect, could peruse them without remarking the extraordinary conciseness of style and moral force by which they are characterized. The most distinguished of all Mr.

M'Gavin's writings is his *Protestant*, a series of papers designed to expose the errors of the Church of Rome, commenced in 1818, and finished in 1822. In the general decline of religious controversial writing, the celebrity acquired by this work is a strong testimony to the powers of the author. In its collected form, in four volumes octavo, it went through no fewer than seven editions in the first ten years. According to Mr. Greville Ewing, in a funeral sermon upon Mr. M'Gavin, "the commencement of the work was casual, and the whole executed with hasty preparation. While engaged in a mercantile business of his own, he had at that time the winding up of an old concern of his partner, the heavy charge of another concern, which in the end proved a severe loss to him, besides other business matters, as factorships, references, as sole arbiter in cases both from private parties and from the Court of Session, which he decided in a manner satisfactory to all concerned; and many other things were devolved on him, which none but a man of clear judgment and unusually industrious habits could have undertaken. A work which otherwise would have been extremely irksome was rendered pleasant by the continued and increasing favour with which it was received by the public in general, and by the approbation of distinguished individuals in each of the three kingdoms. One of the most eminent bishops of the Church of England offered to give him holy orders. That, however, which was most gratifying to the author, was the interest which he was honoured to excite in the public mind with regard to the subject of Popery. I make no attempt to give a particular account of the contents of this work. It is impossible, they are so extensive; it is unnecessary, they are so generally known. It is matter of notoriety that Mr. M'Gavin was prosecuted for certain articles in the *Protestant*, and had a verdict against him, imposing on him a fine of £100, which, with expenses, amounted to above £1200. Into the merits of these things I shall not enter further than to state, in round numbers, that £800 of the £1200 was raised by public subscription, and that the whole, it was believed, would have been more than paid had not each subscriber been limited to a certain sum. As the case had been so arranged, Mr. M'Gavin was obliged, in the meantime, to pay the balance out of his own pocket, of which, great as the amount was, I never heard him complain. The publishers afterwards very handsomely came forward to reimburse the author, which, from the sale of the work, they were enabled to do without loss to themselves, though he had no claim upon them."

Mr. M'Gavin in 1827 superintended a new and improved edition of the *Scots Worthies*—a work commemorating the lives of the most eminent Scottish clergy of the sixteenth and seventeenth centuries, and originally written by an unlearned individual named John Howie of Lochgoin. The book was greatly improved by the notes of Mr. M'Gavin. He soon after published a refutation of the peculiar views of Mr. Cobbet in his *History of the Reformation*, and a similar exposure of the principles of Mr. Robert Owen. Being a decided enemy to the connection of the church and state, he was induced to embody his sentiments on that subject in a pamphlet, entitled *Church Establishments considered, in a Series of Letters to a Covenanter*. Not long before his death Mr. M'Gavin superintended a new and improved edition of Knox's *History of the Reformation*, and aided with an introduction a work by the Rev. Mr. John Brown of Whitburn, entitled *Memorials of the Nonconformist Ministers of the Seventeenth*

Century. In the midst of his divers labours he suddenly died of apoplexy, August 23, 1832.

Of the intellectual vigour and religious fervour of Mr. M'Gavin, his published writings afford a sufficient and lasting memorial. His personal qualities are not, however, fully shown in that mirror. His diligence in his ordinary secular employments, his zeal in promoting the religious and worldly interests of all who came under his notice, his mild and amiable character in private society, are traits which must be added. Two of his most conspicuous qualities—the power of a satirist, and a certain precision which appeared in all he either spoke or wrote—might be supposed incompatible with the tenderer lights of a domestic character. But in him the one set of qualities was not more conspicuous than the other. "His personal disposition," says Mr. Ewing, "was that of the publican who pleaded with God for mercy when he went up into the temple to pray, and returned justified, because he that humbleth himself shall be exalted. Like Nathaniel, he was an Israelite indeed in whom there was no guile. Like Paul, he was ready to call himself less than the least of all saints, and to ascribe his salvation to Jesus Christ, having come into the world to save sinners, of whom he was a chief. He had, even in his natural temper, much tenderness of heart, much sincere and generous benevolence. If conscious of any quickness, which I have heard him acknowledge, but never saw, it was guarded by the vigilance of Christian meekness, and by the genuine modesty of superior good sense. Those who knew him only from feeling the lash of his controversial writings, may have been tempted to think of him as an austere man. In truth, however, he was the very reverse. The profits of the *Protestant* he once offered as a subscription to the society in this city for the support of the Catholic schools. The offer was declined, because some of the Roman Catholic persuasion regarded it as an insult. I do not wonder at the misunderstanding. But had they known him as I did, and as he was known by all his familiar friends, they would have accepted of his offer as a mark of his cordial good-will to a valuable institution."

MACGILL, STEVENSON, D.D., professor of theology in the university of Glasgow, was born at Port-Glasgow on the 19th January, 1765. He received the earlier part of his education in the parish school of Port-Glasgow, and at the age of ten was sent to complete it at the university of Glasgow. Here, as his destination was for the ministry, he went through a nine years' course, where his proficiency in literature, science, and theology obtained a considerable number of class honours, and secured the approbation of his professors. On the completion of his studies Mr. Macgill was licensed as a preacher by the presbytery of Paisley in 1790, and soon after received the offer of the chair of civil history in St. Andrews, a charge which was to be united with a small country parish. But even thus early, and in spite of so alluring a temptation, he was the uncompromising enemy of ecclesiastical plurality, and therefore the offer was refused. In the year after he was licensed to preach he was presented to the parish of Eastwood; and while he continued there, his ministry was distinguished not only by careful study and preparation for the duties of the pulpit, but also by his attention to the moral and religious instruction of the young of his parish, and the proper support of the helpless poor. The diffusion of infidel and revolutionary principles, which the recent events in France had occasioned, also called forth the anxiety of Mr. Macgill; and in 1792

he published a small tract, entitled the *Spirit of the Times*, particularly addressed to the people of Eastwood, in which he temperately and judiciously warned them against the anarchical theories of the day. After having been for six years minister of Eastwood, he was translated, in 1797, to the charge of the Tron Church of Glasgow, that had become vacant by the death of the Rev. Dr. M'Call. Here his pastoral labours were at least of threefold amount, in consequence of the rapid growth of the population, and the increase of poverty, ignorance, and crime, with which it was accompanied. But to these he addressed himself in a right apostolic spirit, and with an effectiveness of which Glasgow still reaps the fruits. Soon after his arrival in Glasgow, the well-known period called "the dearth" occurred, and Mr. Macgill became an active advocate for the establishment of soup-kitchens, and other means for the relief of the poor. The comforts and cure of the sick, and the coercion and reformation of the criminal, were continual objects of his pastoral solicitude, and therefore he became a careful superintendent of the wants of prisons and the infirmary. In him too the Lunatic Asylum of Glasgow, which has been so efficient an institution for the relief of the worst of all maladies, found not only its best friend, but also its chief originator, in consequence of the impulse which he gave towards the erection of that noble structure. One defect also under which Glasgow laboured until it had grown into an evil of the first magnitude, called forth his active exertions. This was the deficiency of church accommodation, which, although common to Scotland at large, from the increase of the population, was particularly felt in Glasgow, where the ratio of increase had been unprecedented, and was still continuing to go onward with a constantly growing magnitude, while the number of the city churches remained stationary. Nothing could more effectually encourage dissent than such a state of things; and accordingly, the great mercantile city of the west, once so famous for its hearty attachment to the Kirk which the Reformation had established within its walls, was now becoming the great emporium of Scottish sectarianism. Nor was this the worst; for even the numerous chapels that were erected by the different sects were still inadequate either for the growth of the population or for the poverty of the masses, who were unable to contribute their prescribed share for the maintenance of the self-supporting principle. All this struck the observant eye of Dr. Macgill, who tried every method, both with the church-court and town-council, to have the evil removed by the erection of new churches, as well as the way prepared for their full efficiency, by the extension and improvement of the civic parochial education. For the present, however, he laboured in vain; for the city dignitaries of the day were more intent upon the great wars of the Continent, and the movements in the Peninsula, than those evils around them that required no far-seeing sagacity to detect; and thus "the righteousness that exalteth a nation" was left to a future hearing. But his appeals were not ineffectual, although for the present they seemed to be scattered to the winds, or buried in the earth; for after many years the harvest shot up, and before he closed his eyes he had the satisfaction of seeing the principle of church extension reduced to vigorous action in that very city where his former appeals on the subject had been unheeded.

While Dr. Macgill was thus actively employed upon the important subject of civic economy as developed in prisons, schools, and churches, he was far from being remiss in those studies with which the

more sacred duties of the ministerial office are connected. Seldom, indeed, in any man, was a life of contemplation more harmoniously blended with a life of action; and therefore, amidst a career of practical hard-working usefulness, which he continued until he was stretched upon a death-bed, he was an inquiring and improving student, who felt that he had still something to learn. Such was the disposition with which he commenced his ministry in Glasgow. He knew the quantity of out-door work that would beset him in the discharge of his duty, and he was aware of its tendency to mar the occupations of the study, and arrest or throw back the mind of the minister, and shut him up within the narrow circle of his early acquisitions. But he knew withal that the duty of intellectual self-improvement was equally urgent with that of active everyday usefulness. On this account he proposed to his brethren of the presbytery the plan of a literary and theological association for mutual instruction, by the reading of essays and oral discussions; and the proposal was so acceptable that in 1800 a society for the purpose was formed, whose meetings were held once a month. The important subjects which it kept in view, and its plan of action, were admirably fitted for the clergy of a large city, who, of all men, must keep abreast of the learning and intelligence of the age. While he was a member of this literary and theological association, Dr. Macgill read, in his turn, a series of essays which he had written on the pastoral office and its duties, and the best ways of discharging them with effect. These essays, which were afterwards published in the form of letters, entitled *Considerations addressed to a Young Clergyman*, gave ample proof of his high appreciation of the ministerial office, and sound views of an appropriate clerical training. The work, also, as well as the consistent manner in which he had always acted upon its principles, pointed him out as the fittest person to occupy a most important office in the church. This was the chair of theology in the university of Glasgow, which became vacant in 1814, by the death of Dr. Robert Findlay, who had held it for more than thirty years.

On his election to the professorship of divinity, Dr. Macgill addressed himself in earnest to the discharge of its onerous duties. And that these were neither few nor trivial may be surmised from the fact, that the general number of the students in the divinity hall was above 200, while their exclusive instruction in theology, instead of being divided among several professors, devolved entirely upon himself. The mode also of teaching that most complex as well as most important of sciences, was still to seek; for as yet the training to the ministerial office was in a transition state, that hovered strangely between the scholastic pedantry and minuteness of former years, and the headlong career of innovation and improvement that characterized the commencement of the nineteenth century. And in what fashion, and how far, was it necessary to eschew the one and adopt the other? It is in these great periodic outbursts of the human mind that universities stand still in astonishment, while their learned professors gaze upon the ancient moth-eaten formulas, and know not what to do. To teach theology now was a very different task from the inculcation of Latin and Greek, which has continued the same since the days of Alfred. The first years, therefore, of Dr. Macgill's labours as a professor, consisted of a series of experimenting; and it was fortunate that the duty had devolved upon one so patient to undergo the trial, and so observant of what was fittest and best. At length the whole plan of theological instruction was

methodized into a system that worked harmoniously and effectively under the control of a single mind. It was felt to be truly so by the students who passed under its training; so that each fell into his own proper place, and the daily work of the divinity hall went on with the regularity of a well-adjusted machine. It was sometimes objected to the course of lecturing, that it attempted to comprise too much; that it descended to too many minutiae; and that the fit proportion which each subject should bear to the whole was thus lost sight of. Dr. Macgill himself was sensible of these defects, and many years before his death employed himself in lopping off whatever he considered to be redundant in his lectures, and condensing whatever was too diffuse. But let it be remembered, also, that when he commenced he was groping his way along an untried path. Even his learned predecessor, Dr. Findlay, had laid out for himself a theological course of such vast range as an ordinary life would have been utterly insufficient to overtake; and thus, at the end of each four years' course, his pupils escaped with a few theological ideas that had been extended and ramified to the uttermost; a little segment instead of a full body of divinity. But in the other duties of his professorship, where his own individuality was brought into full play, unfettered by forms and systems, Dr. Macgill was unrivalled. In his oral examinations of the class he seemed to have an intuitive sagacity in entering at once into the character of each pupil, and discovering the kind of management which he most needed. In this case it was most gratifying to witness with what gentleness, and yet with what tact, he repressed the over-bold and animated the diffident, stimulated the slothful and encouraged the career of the diligent and enterprising; while his bearing, which was in the highest degree that of a grave divine and accomplished scholar, adorned by the graces of a Christian gentleman, won the reverence, the confidence, and affection of his students. But it was not alone in the class-room that these qualities were exhibited in their fullest measure. His evenings were generally devoted to his students, of whom he was wont to have a number in rotation around the tea-table, so that at the end of the session none had been omitted; and while at these *conversazioni* he could unbend from the necessary formality of public duty, and encourage a flow of cheerful intercourse, it always tended more or less to the great object which he had most at heart—the formation of a learned, pious, and efficient ministry. Nor was this all. Few, indeed, can tell or even guess his cares, his labours, and his sacrifices in behalf of these his adopted children, whom once having known, he never ceased to remember and to care for, and for whose welfare his library, his purse, and his personal labours were opened with an ever-flowing liberality. These were the very qualities most needed by a professor of theology, and best fitted to influence the pupils under his training. Dr. Macgill, indeed, was neither a man of high genius nor commanding eloquence; at the best he was nothing more than what might be called a third-rate mind—a man who, under different circumstances, might have passed through life unknown and unnoticed. But with a mind so balanced, and animated with such high and holy principles, he was enabled to acquire an ascendancy and accomplish a work which first-rate intellects have often attempted in vain.

*After having continued for several years exclusively devoted to the duties of the theological chair, Dr. Macgill suddenly found himself summoned to the arena of a church-court, and that, too, upon a question where the conflict would be at *outrance*.

Hitherto he had been the enemy of ecclesiastical plurality, modified though it was in the Church of Scotland by the union of some professorship with the ministerial charge of a parish, instead of the care of two or more parishes vested in one person. And while some confined their hostility to the objection that the chair and the pulpit generally lay so far apart that the holder must be a non-resident, the objections of Macgill were founded upon higher principles. He knew that plurality was totally opposed to the laws and spirit of the Scottish church; and he was too well aware of the important duties of a minister to have his office conjoined with any other pursuit. And now the time and occasion had arrived when he must boldly step forward and speak out. In 1823 the Rev. Dr. Taylor, principal of the university of Glasgow, died, and the Rev. Dr. Macfarlan, minister of Drymen, was appointed to succeed to the office. But hitherto the principal of the college had also been minister of St. Mungo's, or the High parish of Glasgow, and it seemed a matter of course that Dr. Macfarlan should hold both livings conjointly, to which he was appointed accordingly. It was the gentlest form in which plurality had ever appeared in Scotland, for both charges were in the same city, while the one, it was thought, could not infringe upon the duties of the other. But to Dr. Macgill it appeared far otherwise. By the statutes of the college the principal was bound to superintend its secular affairs, and teach theology, which was a task sufficient for any one man; and thus the holder would be compelled either to give half-duty to both offices, or reduce one of them to a sinecure. It was upon these arguments that Dr. Macgill opposed the double induction. It was a stern and severe trial that thus devolved upon one who had hitherto been such a lover of peace; and it was harder still, that his opposition must be directed against one who was thenceforth, let the result be what it might, to become his daily colleague as well as official superior. Many in his situation would have contented themselves with a simple *non liquet*, whispered with bated breath, and thought their vote a sufficient testimony of their principles. Superior, however, to such considerations, and anticipating the great controversy that would be at issue upon the subject, Dr. Macgill, several months before it took place, brought the question before the senate of the university, and finding that his learned brethren would not coincide with him, he had entered in the college records his protest against the induction. In the keen debates that afterwards followed upon the subject in the presbytery of Glasgow, the synod of Glasgow and Ayr, and at last the General Assembly, to which it was carried for final adjudication, Dr. Macgill assumed the leadership; and few, even of his most intimate friends, were prepared for that masterly eloquence which he exhibited at the first step of the controversy. In taking his chief ground upon the argument of the responsibility of city ministers, and the immense amount of labour which they had to undergo, especially in such a city as Glasgow, he invoked his brethren of the presbytery in language that was long afterwards felt and remembered. The question, as is well known, was lost by the evangelical party; and the union of the offices of principal of the university of Glasgow and minister of the church and parish of St. Mungo was confirmed, as well as the continuance of plurality sanctioned. But this was only a last effort. The opposition which Dr. Macgill thus commenced had aroused the popular feeling so universally upon the subject as to command the respect of the government; and the royal commission which was afterwards appointed for

visiting the universities of Scotland confirmed the popular expression. Let us trust that the evil thus denounced and banished will never again find an entrance into our national church.

Besides his hostility to ecclesiastical pluralism, Dr. Macgill was decidedly opposed to patronage, and earnest for its abrogation. He did not, however, go the whole length of his brethren in advocating the rights of popular suffrage. On the contrary, he was opposed to merely popular elections, and held that they had never been the law of the Church of Scotland. Still he was of opinion that the existing patronage was a great evil, that required a total amendment. He declared it to be a hard thing upon the people of Scotland, that an individual, who might be deficient in principles, knowledge, and morals, should dictate to the worthy and respectable the man whom they should receive as their minister. And it was harder still, he thought, that this patron might be of any or of no religious belief, and in either case opposed to the faith of those over whom he appointed a minister. But worst of all, this right, originally intended for the good of the people in their highest interests, might be bought, like any marketable commodity, by a person wholly unconnected with the parish, and who had no interest in its welfare. The church, indeed, had power to judge and decide on the qualifications of the presentees, by previously trying them as licentiates, and finding them competent for the work of the ministry in general, in life, doctrine, and knowledge. But the preacher thus approved of might be unqualified for the particular charge to which he was designated; so that however orthodox, learned, and pious his manners, his habits, and mode of preaching might be, they might still be such as to make him unsuitable for the people over whom he was appointed. For all this a remedy was necessary; and that which Dr. Macgill had long contemplated he propounded before the committee of the House of Commons appointed to try the question of patronage in Scotland. For this purpose his first desideratum was, the abolition of the act of Queen Anne for the restoration of patronage in our church. This being obtained, he proposed to divide the representation of the parish between three bodies, consisting of the heritors, the elders, and the male communicants, each body to be represented by three delegates, to whom the nomination of the future pastor might be intrusted. Let this committee of nine, after having weighed the case, present to their constituents the person of their choice, whom they had approved by a majority of votes; and should any disputes afterwards arise upon the concurrence of the people, let the case be settled by the decision of the church-courts. Such is an abstract of his plan, by which he hoped the despotism of patronage on the one hand, and the anarchy of popular election on the other, would be equally avoided. But subsequent events showed that this, as well as many other such plans, was but a "devout imagination." The agitation against patronage was followed by the veto-law, and finally by the Disruption. No compromise or half measures—nothing short of a total abrogation of the evil complained of—was found sufficient to satisfy the remonstrants.

After this the course of Dr. Macgill's life went onward tranquilly but usefully; and of the events that occurred till the close, a brief notice may suffice. In 1824, in consequence of a discovery by Dr. M'Crie, the able biographer of John Knox, that our Scottish reformer was educated at the university of Glasgow, Dr. Macgill conceived that Glasgow was the proper place in which a monument should be erected to his memory. The idea was eagerly

caught by several of the spirited citizens, and the result was that stern column on the height of the Fir Park, better known as the Glasgow Necropolis, surmounted by the statue of Knox himself, with the Bible in one hand, and the other stretched out towards the rapidly-growing city, as if he were in the act of uttering the old civic motto, "Let Glasgow flourish by the preaching of the Word." In 1828 Dr. Macgill was unanimously elected to the office of moderator of the General Assembly—an office which it was thought he should have occupied at a still earlier period, but for the predominance of that party in the church to which his views in doctrine and discipline were opposed. In 1835 he was made one of the deans of the chapel-royal, a merely honorary appointment, having neither emolument nor duties at that time attached to it. Three years after (1838) he was busily occupied with the plan of erecting a house of refuge for juvenile delinquents in Glasgow—one of his many successful public efforts for the instruction of the young and reformation of the vicious. During 1838 and 1839 he was also employed in preparing two volumes for the press. In 1839, though now borne down by age and the pressure of domestic misfortunes, he resolved to encounter the labours of the winter as he had been wont; and in October he opened the divinity hall, and went through the half-year's course without having been absent a single day. But it was life's last effort. In the end of July, while returning from Bowling Bay, where he had been visiting a friend, he was caught in a heavy shower of rain: a cold and sore throat ensued, that soon turned into fever, accompanied with delirium, in which he was generally either in the attitude of prayer, or employed in addressing an imaginary audience. It was indeed the ruling passion strong in death—the predominance of that piety and activity which had formed his main characteristics through life. He died on the morning of the 18th of August, 1840, in the seventy-sixth year of his age.

Dr. Macgill was not a voluminous writer; this his devotedness to his daily public duties prevented, as well as the fastidious views which he entertained of authorship, that made him unwilling to commit to the press anything which he had not deeply studied and carefully elaborated. Whatever therefore he has written, he has written well. Besides his *Letters to a Young Clergyman*, he published *Discourses and Essays on Subjects of Public Interest*, *Collection of Translations, Paraphrases, and Hymns*—several of which were his own composition, *Lectures on Rhetoric and Criticism*, and on *Subjects Introductory to the Critical Study of the Scriptures*, and a volume of sermons, dedicated "to his former pupils, now his brethren, as a remembrancer of past times." But even when his writings are forgot, his labours in the Scottish church, rent asunder though it has been since his death, and the benefits of these labours upon all parties, will continue to remain a unanimous and hallowed remembrance.

MACGILLIVRAY, WILLIAM, A.M., LL.D. This distinguished naturalist, and popular writer in several departments of natural science, was born in the island of Harris. Having early acquired a taste for the studies by which he rose to distinction, and gone to reside in Edinburgh, he became assistant to Professor Jameson in natural history and the geological museum of the university. From this he was afterwards transferred to the office of conservator of the museum of the Royal College of Surgeons in Edinburgh. He thus enjoyed in each position very favourable opportunities of studying the specimens and preparations that were placed under his charge,

and of these opportunities he zealously availed himself. But he was not a mere recluse student, or one satisfied with the specimens which others had placed within his reach; he also was a diligent Rambler in the fields, watching attentively the phenomena of nature not in one but in many departments. The fruits of these multifarious investigations were displayed with happy effect both in his lectures and writings, in which every subject he treated was fully and clearly illustrated more or less from his own personal knowledge. Though a lecturer on botany, his earlier publications were connected with geology, and this department of science continued to obtain a portion of his studies during the rest of his life. His geological papers accordingly were numerous, and in 1839 he published *A Manual of Geology, with a Glossary and Index*. In 1834 he published a small edition of Withering's *Arrangement of British Plants*, a work of great benefit to young students in botany. In zoology, by which he was still better known and more highly distinguished, he studied every family of the animal kingdom, and contributed largely to the literature of many of its special departments. Of these productions were his *Conchologist's Text-book*, which has gone through six editions; his *History of the Molluscan Animals of the Counties of Aberdeen, Kincardine, and Banff*; and papers on various species of shells. He was the author of the seventh volume of Jardine's *Naturalist's Library*, which contains an account of British quadrupeds. He also published a paper on the *Mammalia of Aberdeen and the adjoining Counties*. This enumeration will convey some idea of his multifarious pursuits. It was perhaps too wide, as is confessed by his admiring reviewer in the *Athenæum*: "Dr. William Macgillivray," he writes, "was a naturalist, and one of no mean order. Had he confined his attention to a few of the subjects of the vast field over which he laboured with unwearied industry through a long life, he would perhaps have attained to a yet higher position as a man of science than that which he reached. Whilst in the fields, on the mountains, or by the sea-shore, he had an eye not only to birds, but to every natural object that surrounded him; and the interest with which he regarded them is expressed in the numerous papers and works which he has written on botany, geology, and zoology."

But the work by which Dr. Macgillivray is best known, and will be longest remembered, is his *History of British Birds, Indigenous and Migratory*. No anatomist had ever dissected so large a number of birds, or was so well acquainted with their internal organization. No one also had more carefully studied their habits in all the places of their resort, among rocks and islands, on the sandy shores of the sea, in the firths and estuaries, and in the inland waters. It was well that one so well qualified should concentrate his great natural powers and extensive knowledge upon the subject of ornithology, as the science had hitherto been defective and uncertain. Birds were arranged according to their external form; Linnæus grounded his system upon the shape of the feet and bill, and Vieillot his upon the legs. But the better plan, which Dr. Macgillivray was the first to carry out, was to arrange them according to their internal structure. This dissection was so minute and specific, that the birds of every species were characterized with a distinctness that was wholly new, and perhaps is tiresome to ordinary readers; but on the other hand, his descriptions of each in full life and plumage, and as it subsisted in its own fashion, is so full of graphic power and eloquence, as to be more than a counterpoise to such scientific speciality. In describing the nature and habits of the birds, his own

observation was brought into play; but where it was incomplete, he had recourse to twelve authors, whose means of information about particular species were superior to his own—an assistance which he frankly acknowledges. The first three volumes of his *British Birds* appeared in 1837, and completed his account of land birds. A fourth and fifth volume, which were published a very short time previous to his death, treat of those birds which inhabit the waters. But even while these volumes were in preparation for the press, he felt his last illness making such progress that he feared he should not live to complete them. Accordingly, in his preface to the fourth volume, dated from Torquay, he pathetically alludes to his feeble health, which prevented him from following the sea-birds to their rocky fastnesses, where he could personally observe their manners and habits. "As the wounded bird," he sadly writes, "seeks some quiet retreat, where, freed from the persecution of the fowler, it may pass the time of its anguish in forgetfulness of the outer world, so have I, assailed by disease, betaken myself to a sheltered nook, where, unannoyed by the piercing blasts of the north, I had been led to hope that my life might be protracted beyond the most dangerous season of the year." His yearnings for a complete accomplishment of his beloved task were so far gratified, that he lived to complete the fifth volume, and died almost simultaneously with its publication. The manner in which he bids adieu to his readers is so full of his own character and history, and withal so tender and pathetic, that we quote it in full, as the best commentary upon his labours and their close:—

"I have finished one of the many difficult and laborious tasks which I had imposed upon myself. Twelve years have elapsed since the first three volumes of this work were issued to the public, and I had scarcely hoped to see its completion when I was most unexpectedly encouraged to revise the manuscript of the two remaining volumes, containing the wading and swimming birds, of which the history, in so far as I am acquainted with it, is now given on the same plan as that adopted for the land birds. Commenced in hope, and carried on with zeal, though ended in sorrow and sickness, I can look upon my work without much regard to the opinions which contemporary writers may form of it, assured that what is useful in it will not be forgotten, and knowing that already it has had a beneficial effect on many of the present, and will more powerfully influence the next generation of our home ornithologists. I had been led to think that I had occasionally been somewhat rude, or at least blunt, in my criticisms; but I do not perceive wherein I have much erred in that respect, and I feel no inclination to apologize. I have been honest and sincere in my endeavours to promote the truth. With death, apparently not distant, before my eyes, I am pleased to think that I have not countenanced error, through fear or favour. Neither have I in any case modified my sentiments so as to endeavour thereby to conceal or palliate my faults. Though I might have accomplished more, I am thankful for having been permitted to add very considerably to the knowledge previously obtained of a very pleasant subject. If I have not very frequently indulged in reflections on the power, wisdom, and goodness of God, as suggested by even my imperfect understanding of his wonderful works, it is not because I have not ever been sensible of the relation between the Creator and his creatures, nor because my chief enjoyment when wandering among the hills and valleys, exploring the rugged shores of the ocean, or searching the cultivated fields, has not been in a sense of

His presence. 'To Him who alone doeth great wonders' be all glory and praise. Reader, farewell."

It is only necessary to add a few particulars to the memoir of this talented and amiable naturalist. The distinction which he had acquired in science by his publications procured for him the title of LL.D. from the university of Aberdeen, and afterwards the professorship of natural history, and the appointment of lecturer in botany in Marischal College. Dr. Macgillivray was also a member of the Wernerian Natural History and Royal Physical Societies of Edinburgh, and of the Natural History Society of Philadelphia. Besides his works already mentioned, he published the *Travels and Researches of A. Von Humboldt in the Equinoctial Regions of America and in Asiatic Russia*, forming vol. x. of the *Edinburgh Cabinet Library*, 12mo, 1832; *Lives of Eminent Zoologists, from Aristotle to Linnaeus*, 8vo, 1834, also published in the *Edinburgh Cabinet Library*; and the *Rapacious Birds of Great Britain*, 12mo, Edinburgh, 1836. At the time of his death he had prepared for the press a volume on the *Natural History of Dee-side*, containing an account of a personal tour up the valley and among the mountains of that district, with sketches of the geology, botany, and zoology of Dee-side, and lists of its minerals, plants, and animals; but as this work could scarcely be expected to command a remunerative sale, Dr. Macgillivray's family declined to publish it. It was not, however, destined to remain in oblivion. Her majesty Queen Victoria having heard of it, generously purchased the manuscript from the family, and ordered it to be printed for private circulation. It forms a handsome octavo volume, illustrated with several wood-cuts of the scenery of the district, and a carefully executed map of the district of the river Dee, with the geology of the valleys and mountains laid down; and copies of the work were liberally presented by his royal highness Prince Albert to the naturalists, natural history societies, and public libraries of Great Britain.

Dr. Macgillivray left a numerous family behind him, of whom the eldest son, Mr. John Macgillivray, accompanied Captain Stanley as naturalist in the voyage of the *Rattlesnake*, and published a narrative of the voyage, including discoveries and surveys in New Guinea, &c., in 1852. He also assisted his father by supplying much valuable matter to the last two volumes of the *History of British Birds*, and has published several papers on various departments of natural history. It only remains to be mentioned that Professor Macgillivray died at Aberdeen on the 5th of September, 1852.

M'GRIGOR, SIR JAMES, Bart., K.C.B., &c. This distinguished military surgeon, whose professional talents were a great though unrecorded agency in the successful career of our British armies in the Peninsular war, was the eldest of three sons of Colquhoun M'Grigor, Esq., a merchant of Aberdeen, by Ann, daughter of Lewis Grant, Esq., of Lethindrey, in Strathspey, Inverness-shire—at which place the subject of our memoir was born in 1771. He was educated at the grammar-school of Aberdeen, at that time reputed one of the best public schools in the kingdom; and at the close of the five years' course, an event there befel him which awoke him to a life of public enterprise and activity. Before the provost, the magistrates of the city, and professors of the university, assembled in the common hall, the first prize of the school was awarded him by the rector. His heart did not swell with higher pride when nearly half a century afterwards he was elected lord-rector of the university of Aberdeen.

After the usual course of five years at the high-school, James M'Grigor entered Marischal College, where, at the close of the fourth session, he took the degree of A.M.

Being now furnished with a sufficient amount of scholarship for all ordinary purposes, the profession he should adopt was the next question. His father was desirous that he should become a merchant like himself, but James had already acquired other tendencies than those of buying and selling. He had chiefly associated with medical students, and acquired an interest in the subjects of their study. One of these youths had also obtained a medical appointment in the army, and his smart cocked hat and cockade attracted the admiration of M'Grigor. His choice was fixed: he would be a surgeon, and not only so, but an *army*-surgeon. He became a regular student of medicine first in Aberdeen and afterwards at the university of Edinburgh, where he pursued his studies with such intensity as at one time greatly to affect his health for several months. Having finished his medical education and returned to Aberdeen, he there formed among the students, in 1789, the Medical Society for that city. Its origin was small and humble, but it was fortunate in having Mr. M'Grigor for its originator, as it expanded under his fostering care, and rose with his professional rise, until it became one of the most respectable institutions of its kind in the kingdom. "I watched," he says, "its advancement and its success with the anxiety of a parent. By my own subscriptions, donations of books, and continued warm importunities to my numerous friends, I obtained no small proportion of the funds required for the erection of the handsome building which the society now possesses, and which contains its valuable library, museum, &c."

On the commencement of the war with France, Dr. M'Grigor's desire to be an army-surgeon broke out with such fresh intensity, that he gave himself no rest until he had purchased a medical commission in the Connaught Rangers. He would have preferred a Scottish regiment, but was dissuaded by the army agent, who remarked to him, "Your prudent countrymen will soon make their way in an English or Irish regiment, but in one of their own corps there are too many of them together; they stand in the way of each other." M'Grigor never afterwards regretted that he followed the suggestion. The 88th regiment, better known by the name of Connaught Rangers, to which Dr. M'Grigor now belonged, was both as to officers and soldiers exclusively Irish, and during the whole course of the war it was difficult to tell whether its tumultuary recklessness in the camp, or fearless courage in the field, was the most conspicuous. After the regiment had been stationed for a short time at Jersey, it was ordered to Bergen-op-Zoom, and Dr. M'Grigor, although well nigh reduced to extremity by an attack of typhus fever, would not be left behind. His professional zeal was rewarded by a complete recovery during the voyage. From Bergen-op-Zoom, the Connaught Rangers were transferred to Nimeguen, to form part of the British garrison, as the town was about to be besieged by the enemy. Here, in addition to the care of the sick, the doctor experienced the usual dangers of a siege until Nimeguen was evacuated; and he suffered, in common with the troops, in their disastrous retreat through North Holland, dispirited, famished, and wasted by disease. On one occasion he was carried along insensible, and apparently dying, to save him from falling into the hands of the Dutch, who murdered our sick soldiers in revenge of their houses having been burned by our troops for

fuel. Helpless as a child he was in like manner conveyed into the transport that was to carry him to England, and was unable to ascend upon deck until the vessel anchored at Yarmouth.

After several changes the Connaught Rangers were marched to the neighbourhood of Southampton, and the regiment having got Lieutenant-colonel (afterwards Marshal) Beresford for its new commander, a quarrel between the future victor of Albuera and Dr. M'Grigor occurred. The colonel's manner was harsh, haughty, and exacting; he found at his arrival much sickness in the regiment, and, forgetful of the careless and intemperate habits of his countrymen, he was disposed to lay the blame upon the doctor. After repeatedly quarrelling about the sick-list which M'Grigor presented every morning, he at last broke forth, "This state of things must not continue; I will not have such a number of sick in my regiment, and I am sure the greater part of them are not sick." To this insulting address the doctor replied, "It is not my fault that there are so many sick in the 88th regiment; all I can do is to cure them as fast as I can; and as to not one half of them being sick, I can assure you that every one contained in that report you have in your hand is sick." The colonel swore that it was impossible, and that the doctor must be deceived by sham patients, on which M'Grigor declared, that if the regiment continued in its present mode of living, the number of the sick instead of diminishing would soon be doubled, and that the temporary barracks, besides not being weather-proof, were in such a filthy state as to be a nursery for disease. Finding the fault thus falling back upon his own head-quarters, and inferentially upon himself as their commander, the colonel in a rage went off on a tour of inspection, and over the whole barracks found so much to blame, that every officer in turn came in for a share of his loud displeasure. After a two hours' promenade of this kind, he commenced a survey of the hospital, challenged at each ward by Dr. M'Grigor to declare whether any fault could be found with it—and he found himself compelled to acknowledge that all was right: he even compelled his officers to go through the hospital also, that they might witness the contrast which it presented to the barracks. Still determined to find fault somewhere, Colonel Beresford afterwards blamed the doctor for not appearing with the regiment when on parade, although his numerous duties in the hospital took up the whole of his time, and ordered him to turn out on such occasions with the other officers. Weary at length of such a commander, M'Grigor resolved to exchange into another regiment, and announced his purpose to the colonel; but the latter, who had now come to a better state of feeling, expressed his regret at what had passed, and told him that he had reported favourably of his management of the hospital at the Horse Guards. Struck with this kind act of justice, and the more that it had occurred in the midst of their bickering, Dr. M'Grigor no longer thought of leaving the Connaught Rangers, and ever afterwards he and Beresford continued the warmest of friends.

At length the 88th was to join an army to be embarked for the West Indies, and Dr. M'Grigor repaired to Portsmouth and took up his quarters in the transport that was to convey him. Being required, however, to visit and inspect the recruits in another vessel, he could not return in time to his own, and signal-guns being fired for the departure of another fleet at Portsmouth to the Mediterranean, the ship in which M'Grigor had taken up his temporary abode mistook the order as given to the West India fleet, and went off under such a press

of canvas as distanced every pursuer, and carried her safely to Barbadoes. There, however she was alone in her glory, as the rest of the West India armament did not join her until a fortnight later. This blunder produced strange results as far as Dr. M'Grigor was concerned. Having only had time to exchange his slippers for boots, his luggage was left behind him, and he had to depend upon a joint-stock contribution of the officers who sailed with him for an outfit. On the other hand, the transport in which he should have sailed was captured on the voyage by a French privateer, so that he escaped the miseries of a French prison. His incomprehensible disappearance sorely perplexed his friends, and an officer having fallen in the hurry of embarkation between two transports, and been crushed to death, while his body had dropped into the sea and was never recovered, gave ground to the report that this was no other than Dr. M'Grigor. So firmly was this believed by all, that his own brother, then an officer at Portsmouth, gave it credence, and removed his clothes and baggage on shore. But worse than all was the filling up of his appointment as medical officer of the Connaught Rangers by another, who was gazetted in his room, and who was not made aware of the flaw in his commission until he saw his predecessor in the West Indies still alive and well, and heard the jeering advice of the soldiers, "Now your master has come, go home as soon as you can." Nor was this curious chapter of mistakes yet ended. After Dr. M'Grigor had returned to England, he one day in London met one of his old friends, Captain Maconnachie, formerly of the Connaught Rangers, and took him by the hand; but the other grew pale and breathed hard, so that the doctor thought he had suddenly become ill, and supported him into the Northumberland Coffee-house. Maconnachie thought himself hailed by a ghost, or a dead man risen to life, until a hearty dinner in the coffee-house, and an explanation and social chat, convinced him to the contrary.

The doctor was not long at Barbadoes until he was called both to active and painful duties. To quell a negro revolt in Grenada he was sent as principal medical officer in a ship of war, which he describes as "choke-full" of soldiers; and on landing he was quartered with four other officers in a bomb-proof building, which at night was like an oven. Here he continued, though sick himself, to attend to the sick, until the opposite side of the island was to be occupied, and thither he was sent round with a detachment from the 25th regiment. But this change was only from the discomforts of land to the dangers of the sea; their vessel, which was manned by negroes, suffered shipwreck when only two miles from shore; and after the selfish scramble which is apt to prevail on such occasions, where the weak are thrust aside by the strong and active, the whole party was saved, with only the loss of their baggage, by boats from the shore. In the dangers of the guerilla warfare that followed, independently of his own professional duties, Dr. M'Grigor had an ample share, but upon these it is unnecessary to dilate. Indeed, but for his undaunted spirit and strong Highland constitution, he must have succumbed to the diseases of the climate. On one occasion, while on shore, he was so exhausted by debility that he could only stagger to a house a little way off, enter it, and sink upon a settee in great pain and feebleness. Hearing a gentle sound of some one in the next room, he faintly called for assistance, upon which the master of the house appeared, in whom he recognized an old class-fellow in the colleges of Aberdeen and Edinburgh. It is needless to add that he was cordially welcomed and kindly treated. The insurrection in Grenada

was put down, but not until four times as many had perished by disease as the sword. In his voyage from the West Indies to England, Dr. M'Grigor experienced a combination of the miseries both of land and sea. The transport in which he embarked was an old crank worn-out vessel, that should never have been used for the conveyance of troops; it was wretchedly found in provisions, and was so unhealthy, that yellow fever made fearful havoc both among the soldiers and sailors. To add also to their sufferings, first one master of the ship and then another died, and the third, a sailor from before the mast, who was made captain in their room, was unable to superintend or navigate the ship, being generally drunk from morning till night. As the thought of holding their lives at the mercy of such an incompetent tarpaulin was intolerable, Dr. M'Grigor and the military officers on board, after weathering several chances of foundering, deposed and confined the captain, and elected in his place one of their own number, who had been a midshipman before he entered the military service. But although matters on the whole went more smoothly after the change, their danger was not wholly obviated, for their new commander had become oblivious of some of the most ordinary rules of navigation. He took observations and calculated so strangely, that he told the ship's company they were approaching the British Channel—on the next day that they were in it—and on the third day, while a thick fog was prevalent, that they were in the Downs. But on hailing a ship they were horrified to learn that they were actually in the St. George's Channel, with the mouth of the Mersey not far off. The ship was put about, and a new voyage commenced for the British Channel; but just when their choice commander thought they were nearing the mouth of it, they found their ship entangled in breakers among the Scilly Islands. Their daring captain managed by good luck to thread a needle's-eye passage between the breakers, after which a hurricane blew them to Ireland, and conveyed them in a sinking condition into the Cove of Cork.

After a visit to Scotland, and the pleasure of assuring his relatives that he was still alive, notwithstanding the proofs they had received to the contrary, Dr. M'Grigor rejoined his regiment, and was with it at Portsmouth during the hottest period of the naval mutiny. Soon after its termination, his duties required him once more to go abroad, and tempt, as he had already done, the perils of land and water, war, sickness, and shipwreck. Hitherto indeed his life, as we have seen, was an eventful one, and although often at the point of death, his hopeful spirit and strong constitution rallied while others succumbed. How he found time to improve himself in the science of his profession would be a mystery, were it not that he was always alive to observation, and that to him every change manifested in the diseases of his patients was a fresh chapter of study, which he was careful to master for further use. In this way he had been qualifying himself in England and the West Indies for the treatment of those diseases of climate to which soldiers are the most exposed, and the regulation of military hospitals. These acquirements, by which he was to win such high distinction, were to be matured in India, whither he was ordered to accompany his regiment in 1798.

While detailing his experiences in India, Ceylon, and Egypt, Dr. M'Grigor gives an interesting account of the state of the medical profession at this period in reference to the army. At the commencement of the French war this branch of the service was so little cultivated, and so unpopular, that the government was at its wit's-end to obtain properly

qualified army-surgeons; and to get such as it could, notices were posted on the college-gates at Dublin, Edinburgh, and Glasgow, offering the commission to such candidates as "could pass some kind of examination"—an ordeal which most could encounter without difficulty. This indiscriminate admission of the half-educated, or scarcely at all educated, and for the most part vulgar or vicious characters, into the office of army-surgeon, tended greatly to vitiate its reputation, while men of respectable training and skill were unwilling to be identified with such a fraternity. It was a case sufficient to move the humanity as well as to stir up the professional pride of M'Grigor; and as far as the influence of his advice could go, he endeavoured to remedy the evil. One of his suggestions was, that higher inducements than mere pay, free quarters, and travelling charges should be offered, and that half-pay and pensions should be added as in the case of military officers, to make the office worth the acceptance of men superior in attainments. He also advised the least and worst qualified of the profession, as soon as the war was over, to qualify themselves in earnest, by attending colleges and the medical schools, either at home or abroad. These advices were adopted, and with the happiest results. "The effects of this measure," he tells us in his autobiography, "exceeded the most sanguine expectations that I had formed of it. There appeared a *new spirit of emulation in the service*, which gained for the department much credit with our brethren in civil life; and the effect of the measure in the advantage gained to the public service has been incalculable; for I can fearlessly assert, that in the ranks of the medical officers of the army men are to be found upon a level, at least, with those in the Colleges of Physicians and Surgeons of London, Edinburgh, and Dublin; and the soldier *now* well knows that he has as able advice, and is quite as kindly treated, as when he was the patient of the first hospital or dispensary in the kingdom, previous to enlistment."

From India M'Grigor was ordered to proceed to Egypt, with the force intended to be sent under Colonel Arthur Wellesley, but which was transferred to the command of Sir David Baird. Of this army, numbering about 8000 men, consisting almost equally of Europeans and Sepoys, M'Grigor was appointed superintending surgeon; while to obviate any difficulties that might arise from the army surgeons of the presidencies of Madras or Bombay at one of his majesty's service being promoted over their heads, he was furnished with a commission from the East India Company. On landing in Egypt the march of this army was by the unusual route over the desert of Thebes; but although it suffered from sand-winds, it experienced little sickness until it arrived at Rosetta. The disease that hitherto had annoyed its march was ophthalmia; but on reaching Rosetta a more terrible visitation awaited the Anglo-Indian army, in the form of the plague, which commenced on the morning of the 14th of September, in the hospital of the 88th regiment. Hour after hour during the day the cases of infection continued to multiply until evening, when the visitation had assumed an alarming aspect. M'Grigor, who had discovered the nature of the malady in the first case that appeared, procured a large building near Rosetta, to which the patients were removed; he established a pest-house and an observation-room for doubtful cases; and he directed that, in the infected rooms, lamps for the nitrous fumigation of the atmosphere should be kept constantly burning. The main British army at Aboukir and Alexandria was also suffering from plague, although in a less degree, and there the same precau-

tions were adopted which M'Grigor had established at Rosetta. In this way the plague was stopped, and the danger surmounted. As circumstances had rendered the arrival of the reinforcement under Sir David Baird unnecessary, it was ordered to return to Bombay, and after encamping with it some days in the neighbourhood of the Pyramids, M'Grigor accompanied it in its march through the desert of Suez, and reached Bombay in safety. Here he found fresh occupation for his professional care, as the plague was raging in Persia, and especially at Ispahan and Bagdad. He therefore established a quarantine at Butcher's Island, where every vessel was obliged to anchor and perform quarantine that came from the Persian Gulf or the Red Sea. A few months afterwards he was ordered to return home with two companies of the 88th regiment.

As there was peace at present between France and England, Dr. M'Grigor, on his arrival at the Cape of Good Hope, associated in the most friendly terms with Admiral Lenois and the general who had been sent out by the French government to re-occupy their possessions which had been restored, and the amity between the two nations seemed so well established, that M'Grigor was intrusted with the charge of the despatches from the admiral and general to the French ambassador in London. But soon after he had left the island of Ascension, at which the vessel touched in its voyage to England, he received alarming tidings from the master of an American vessel, that war between France and England had broken out afresh, and that French privateers were cruising directly in their course. The prospects of capture and a French prison were disagreeable interruptions to the ennui of their voyage, and plans were immediately adopted to prevent their realization. For this purpose Captain Gordon of the royal navy, who commanded the transport, caused the six almost useless guns which she carried to be prepared for service, added to them a whole battery of wooden guns, called quakers, which he ordered to be made and mounted by the ship's carpenter, so that they might show at a distance like real cannon, and had the vessel disguised with paint to look like an armed frigate. The hands on board, consisting of fifty invalid sailors, and as many lascars, were also put through their exercise, and taught how to look more numerous and formidable than they really were. In this way it was hoped that, by showing a grim and resolute aspect, an enemy would think twice before attacking them. Soon after, at evening, a suspicious-looking vessel followed in their wake, which sheered off on a shotted-gun being fired at her; but in the morning she reappeared, accompanied by a consort nearly as large as the British ship. To keep these formidable vessels at a distance, so that they might not detect the real weakness of the transport, was now the object of the latter; and Captain Gordon having caused the invalid sailors to assume their dress as sailors of the royal navy, ordered them, lascars and all, to go frequently up and down the rigging, that they might appear a numerous crew; he also, and an invalid navy lieutenant, assumed their uniform, and showed themselves on every part of the deck; while M'Grigor in his uniform of the 88th, another passenger in that of a Bombay light horse volunteer, and a third in a scarlet uniform, stood in conspicuous parts of the deck as three marine officers. All this bravado was effectual; for the enemy, after watching them for hours, and surveying them from different quarters, evidently judged them too strong to be assailed, and sheered off in quest of safer antagonists. The same was their good fortune when they were about to enter the Chops of the Channel: several ves-

sels, apparently French privateers, approached them, but always made off from the transport's frigate-like appearance. On arriving in England Dr. M'Grigor published his *Medical Sketches of the Expedition from India to Egypt*, which he had prepared from his notes at Bombay and in his voyage to England. He hesitated about committing it to the press, until he was encouraged to publish it by Sir Gilbert Blane and Dr. Buchan—two of the most competent judges on the subject of pestilence, and who thought that M'Grigor's treatment of the disease was both original and judicious.

After he had joined his regiment at Helsham in Sussex, Dr. M'Grigor found himself, from the unhealthiness of the place and the want of an assistant, so overwhelmed with occupation, that in 1804, after having been eleven years with the 88th or Connaught Rangers, he was transferred to the royal regiment of Horse Guards Blue, then quartered at Canterbury. As the colonel was a rigid disciplinarian, M'Grigor was obliged to appear accounted as an officer of the corps; and the sudden transformation was so great, that he says, "I burst into a laugh at my own appearance, equipped as I was with a broad buff belt, jack-boots that came high up my thighs, and stout leather gloves which reached nearly to my elbows, with a large fierce-looking cocked hat, and a sword of great weight, as well as length." Who, indeed, in such a blood-thirsty costume could have recognized a gentle practitioner of the healing art? But he discharged his proper duty ably, especially when gangrene had appeared in the hospital, and run its course through most of the patients. From Canterbury the regiment was transferred to Windsor, where he came into frequent contact with George III. and members of the royal family, of whom he relates several amusing anecdotes; but the charm of such princely society was somewhat impaired by the strict, and occasionally contradictory, enactments about the proper costume of army surgeons at the military balls and levees of royalty. Still more offensive to his professional feelings must have been the interferences of royalty itself in his own particular department. He was attacked by a severe hooping-cough, and he tells us, "I was surprised one morning by my friend Dr. Lind, librarian to the queen, calling upon me. He told me he came by desire of her majesty, to recommend my using oil of amber for my hooping-cough, to be rubbed on the spine. I confess," he adds, "I had no faith in the remedy, and did not use it; but my cough continuing inveterate, and inducing much determination of blood to the head, I took my friend Dr. Lind's advice of change of air, and moved from the fine clear air of the neighbourhood of Windsor, to the close confined air of a narrow street in the Strand; where, in the course of ten days, my cough entirely left me."

At this time Lord Melville, who was at the head of the Board of Control, contemplated the project of establishing a fourth presidency in India, which was to include all the eastern islands; and among the officials whom he contemplated for this new presidency was Dr. M'Grigor, who was to be at the head of its medical board. The outcry raised against the project, as a mere device to form good appointments for Scotsmen, was both loud and angry, while the contemplated elevation of M'Grigor produced a ferment in the whole medical department of the East India Company. At first he was delighted with the prospect of such a rise, until he saw the storm which it occasioned; and on learning that Lord Melville had threatened to resign office rather than renounce his nomination, he generously resolved to sacrifice his own wishes, rather than occasion injury

to his patron. He therefore refused the appointment, and expressed his final decision not to leave the king's service, or to go to India. This disinterestedness did not go unrewarded, as he was soon after gazetted deputy-inspector of hospitals. On his promotion appearing in the *Gazette*, the king, on meeting him on the terrace, asked him "How he could leave the Blues?" The doctor, in reply, made his acknowledgments for the new office with which he had been honoured, when the king continued, "But don't you think it a greater honour to be surgeon of such a corps as the Blues?" M'Grigor rejoined, "Every officer is naturally desirous of moving forward in your majesty's service." To this the king remarked, "Aye, aye, all you Scotsmen are ambitious." The last time he saw George III. was soon after on the terrace, when several officers were drawn up on parade, and M'Grigor at the extremity of the line. The king, who wore a green shade over his eyes, looked the doctor full in the face from under it, who expressed his regret at the malady of the royal eyesight. "Aye, aye," said the king, "this is one of the fruits of the expedition to Egypt." Not long after this the symptoms of his mental malady reappeared.

The new appointment of Dr. M'Grigor was every-way satisfactory. At a single bound it carried him three steps upwards in the service, and gave him the highest rank but one in the department. It also introduced his active mind to a wider sphere of duty, and a statistical collection of medical facts, a practice in which he felt especial interest. His charge was the superintendence of the health concerns of the troops stationed in the northern district, including the whole of the troops, militia and line, distributed through Yorkshire, Lincolnshire, and part of Northumberland. The number and magnitude of his duties, that might have daunted or perplexed another, only quickened his activity and deepened his enjoyment, so that in every instance he showed himself equal to the occasion; and while visiting all the hospitals, and inspecting every case of sickness in each hospital, he either inspired his numerous officials by his zeal, or kept them at their duties by his watchfulness. We can only afford from his autobiography a short extract of the nature and mode of his proceedings:—"In the York district I commenced a practice which I ever after persevered in, and found it of the greatest advantage. In my inspection of the hospital of each corps, accompanied by its medical officers, I examined each patient's history, the medical officer reading the particulars of the case at the patient's bed-side, and the treatment hitherto pursued; I then questioned the patient, generally approving of what had been done; but suggesting what might occur to me as to further treatment. On the evening of the day on which I inspected an hospital, all the hospital books were sent to my inn, where I examined them, making note of my remarks. These remarks I subsequently embodied in a letter to the surgeon, when I did not fail to advert to whatever I had indicated on former instructions, if it appeared to have been unattended to; and in this letter I referred to different authors on the diseases which were prevalent, or in which diseases the surgeon appeared not to have been successful. Those letters, marked private, and always couched in friendly terms, had, with but few exceptions, the best effects; where they had not, I at first threatened, once or twice, to report to the general in command of the district; and finally to the board, in order that ultimate steps might be taken. It rarely happened, however, that friendly exhortation to the officer, aided sometimes by a notice or recommendation from

the commanding officer of the regiment, failed to effect the best result."

The remarkable ability with which Dr. M'Grigor discharged his professional duties, and the success with which it was attended, soon arrested notice in the highest quarters; and the Duke of York, declaring that he must not be confined to so narrow a sphere, had him appointed to the charge of the south-west district, one of the largest in England. To this quarter, where the hospital concerns had got out of order in consequence of laxity of discipline, he introduced the same methodical strictness and regularity, which was followed by the same happy effects. Soon after another district was also added to his charge, consisting of Portsmouth and the Isle of Wight. These two places abounded with duties of a peculiar and important kind. At Portsmouth almost all the great embarkations on national expeditions took place, and there was a garrison there of nine or ten regiments, and a large dépôt of prisoners both afloat and on shore. At the Isle of Wight was the dépôt of the recruiting for all the regiments in the service, and the only large general hospital in the country. Such an addition to an already heavy charge might have appeared absolutely overwhelming, more especially as Dr. M'Grigor got an alarming account of the duties of the district from its previous occupant. "I was not dismayed, however," he tells us, "by the extent and formidable nature of the duties now about to be imposed on me. At this time I wanted such a charge. I was full of activity and zeal, and full of confidence that I should well acquit myself of my duties. Above all, I liked them, and felt assured I could do good, having always in view my original plan, which I wanted to execute on an extended scale." His desire was soon gratified, for first one large slice and then another of the district of Sussex, with the medical superintendence of upwards of 5000 more troops, were thrown additionally into his scale. His charge now included the counties of Hants, Sussex, Dorset, Wilts, Somerset, Gloucester, Worcester, and South Wales. In addition to the demands of such an extensive charge, the number of expeditions which at this time were sent from Portsmouth occupied much of his time and attention. The medical concerns of these expeditions were under his charge, and he had to examine each of the transports appointed for the reception of troops, the quantity and quality of the provisions, and particularly of the water on board—also the accommodation for such as might fall sick, the supplies of medical comforts as well as medicine, with the stock of chirurgical materials and instruments supplied and embarked for the expedition. He had, moreover, to examine and inspect each corps as to its health when it arrived; to receive each of the medical officers of the staff; to warrant the advance of their pay, travelling charges, and lodging-money at Portsmouth; and finally, to survey each transport and inspect each corps after embarkation, as also to report to the board the state in which each regiment had embarked. But although he systematically encountered and overcame all these difficulties on the regular principle of "one down and another come on!" the master-difficulty at length arrived, that could not be dealt with so easily. This was the arrival at Portsmouth of the army of Sir John Moore, after the battle of Corunna—that army which after its victory was indiscriminately huddled and closely packed into transports, the healthy, the sick, and the wounded being all mingled *pêle-mêle*, until they were discharged wholesale upon our shore, and all needing more or less medical care. It was only here that M'Grigor confessed the duty to be

"overwhelming." The arrival was unexpected, and the diseased patients who were disembarked conveyed their maladies, chiefly typhus fever and pneumonia, over Portsmouth, and among many of the regiments in other portions of Dr. M'Grigor's districts. But if he was daunted it was only for a moment, after which he showed himself equal to the difficulty. This chaos of confusion worse confounded was reduced to order, expedients were multiplied to meet so many necessities; and after considerable time, but with far inferior loss of life than such a sudden visitation might have occasioned, the hospitals were cleared of the sick of the different corps, and the infections they had left behind them.

So high was now the reputation of Dr. M'Grigor for the medical management of troops, that his promotion only waited for an opening. This seemed to have arrived when Lord Beresford, on taking charge of the Portuguese army, desired that M'Grigor should accompany him as chief of the Portuguese medical staff, with the rank of inspector of hospitals. But before he could enter into this appointment, his destination was altered by a sudden order from government to repair to Walcheren, in consequence of the sickness and mortality which there prevailed in our army. He immediately embarked on board the admiral's ship the *Venerable*, which was in readiness with several transports to proceed to Walcheren. But the ship suddenly struck upon a sand-bank, and every expedient to lighten and remove her was tried in vain. During the night her bulging was terrific, the rudder was carried away, and the water was heard rushing through the opening seams, while at each bump, that seemed as if it would rend the vessel asunder, the shrieks of about eighty women, mostly Irish, the wives of soldiers going to join their husbands at Walcheren, added to the horrors of that terrible night of trial. The main-mast had already been cut away and the guns thrown overboard, except six, to fire signals of distress, and which were discharged every five minutes. At length an American vessel was descried in the distance; but instead of approaching to relieve them, she bore away for Flushing, which was distant about four leagues off. "God help us!" exclaimed an officer of the ship, "we are doomed to destruction: the *Venerable* will not hold out till other vessels can near us!" While this dark surmise was common to all on board, a small brig, warned by their signal guns, approached, and received all the women on board; and scarcely had their safety been thus insured, when all the boats of the British fleet at Flushing were seen coming full manned to their rescue. All in the *Venerable* were thus brought ashore, and Dr. M'Grigor, who was drenched with salt-water and exhausted with working at the pumps, was put to bed, where his sleep was haunted by nightmare dreams, in which he fancied himself lying at the bottom of the sea, with all sorts of horrible fishes surrounding him, and ready to devour him.

Frightful, however, as were these visions, the realities which awaited his waking hours were scarcely less appalling. Hitherto his principal wish had been to witness sickness upon a great scale, that he might learn the most effectual means of curing it; and in this he had been gratified during his advance in the science, by the widening of his sphere of observation at every step. But the Walcheren spectacle exceeded all that he had seen or imagined. There a conquest and an occupation was worse than the worst of defeats, and the soldier's field of glory was truly the valley of the shadow of death. The number of the wounded, and especially the sick, comprised nearly half of the British army, and on

Dr. M'Grigor's arrival the medical stores were found nearly empty. The article in chief request was bark, but scarcely any of this powerful remedy remained. Providentially an American vessel which had arrived with a large supply of champagne and claret for the suttlers, had brought some chests of bark on a venture, and this the doctor bought up and used, until a fresh supply arrived from England. A defect as serious as the want of medicine was the want of money, for the accounts of the medical department had got into such a state of confusion, that Dr. M'Grigor had to look after their rectification as well as the condition of the sick-rooms and hospitals. Alarmed at the fearful mortality, our government resolved that a member of the medical board should proceed to Walcheren to investigate and report, and Sir Lucas Pepys, the physician-general, was selected for that purpose; but he refused to go, and his excuse was that he was unacquainted with the diseases of the soldier in camp or in quarters. A strange apology for a functionary holding such a commission! At length, after such a dangerous service had been banded to and fro, two government physicians were ordered out, accompanied by Sir Gilbert Blane, who joined them as a volunteer; and on arriving at Walcheren they found the region so unhealthy, and the army so wasted by mortality and sickness, that they could counsel nothing better than that our troops should be instantly withdrawn. This accordingly was done, and when he reached Canterbury, after landing at Deal, Dr. M'Grigor was taken ill with the Walcheren fever, which had been lurking in his system before he left that place of pestilence. Had he remained at Flushing a day or two longer his fate would probably have been sealed. It was well for him, however, that the seizure took place in England, and that kind skilful friends as well as efficient remedies were at hand. He recovered, and after a strict parliamentary inquiry into the whole case of the Walcheren expedition, all classes united in absolving him from any share in its blame, while they commended his diligence, devotedness, and professional skill.

On his return to England the doctor resumed his place at Portsmouth and the superintendence of his districts; and in June, 1810, he married Miss Grant, the sister of his friend Dr. (afterwards Sir James) Grant. Marshal Beresford was again desirous that he should superintend the medical department of the Portuguese army, which had been offered him by government before his departure to Walcheren; but now that he was a husband, this situation had fewer allurements for him than when he was a bachelor—and besides, he now held the permanent rank of inspector of hospitals, which would only have been local if he had joined the Portuguese army. He was happy in his own new home at Portsmouth, his duties after his late campaign had become light by comparison, and he was father of a son not yet six months old, when he was suddenly whirled once more into the vortex of military active life by an order to embark immediately for the Peninsula, as chief of the medical staff under Lord Wellington. "At any other time," he says, "this appointment would have gratified me to the full extent of my ambition: but the happiness I had enjoyed in the married state made it now a sad and painful change to me. The announcement was a sad blow to my beloved wife, who at once determined to be my companion. I had, however, seen enough of ladies on service in the field to decide me against that step; and I knew well, that with the care of my wife and child, I could not do my duty in the way in which I had determined it should be done while I remained in

the service." Under these prudential considerations he set off alone for Portugal, and reached Lisbon on the 10th of January, 1812. So far as the mere pleasures of climate were concerned the change was a happy one. On leaving Falmouth the streets were covered with black ice and the surrounding mountains with snow; but when he looked a few days after from the windows of his bedroom at Belem, he was astonished to find himself in a land of sunshine, with its orange-trees covered with fruit. It was too flattering and fallacious a welcome to a land laid desolate and overwhelmed beneath the horrors of war.

At Lisbon, where his professional duties commenced, Dr. M'Grigor found great irregularity both in the medical stores and the purveyors' and apothecaries' accounts. The city and its neighbourhood were likewise so delightful, that a marvellous number of sick from the army, both officers and soldiers, had accumulated there, who seemed in no hurry to recruit their health and fit themselves for a return to duty. Of all these circumstances he took a minute account, which he communicated to Lord Wellington, accompanied with suggestions as to the mode of remedy; and of these the great commander highly approved. At the time, indeed, so great were the emergencies of the British army that not a man who was fit for duty could be spared. Being invited to head-quarters to confer with his lordship on the subject, the doctor went thither, and at the first interview Lord Wellington remembered that when he was only Colonel Wellesley he had met with M'Grigor in India. This naturally led to the mention of the 88th regiment, now serving in Portugal, to which the doctor had been again attached; and in a full company in the dining-room, Wellington asked if he had met any of the Connaught Rangers in his route. On the doctor replying that he had not, the other jocularly observed, "I hope from your long living with them you have not contracted any of their leading propensities; for I hang and shoot more of your old friends for murders, robberies, &c., than I do of all the rest of the army." On seeing that the doctor was abashed, and the whole company laughing loudly, Wellington added apologetically, "One thing I will tell you, however; whenever anything very gallant, very desperate, is to be done, there is no corps in the army I would sooner employ than your old friends the Connaught Rangers."

The state of the military hospitals for the British army in the Peninsula—with the exception of the snug billets at Lisbon—were, on the arrival of M'Grigor to superintend them, in great need of such a strict and able censor. The official accounts had been carelessly kept; and as if to cover this unpardonable offence, and make any remedy hopeless, his predecessor in office had carried with him to England almost all the office books and papers, even the letter-books, and the orderly-book and those containing Lord Wellington's standing-orders to the army. As without these he could not advance a step, the doctor indignantly reclaimed them—although when they arrived from England they were found so imperfect as to be of little use. Left almost entirely to his own resources, he availed himself of the experience he had acquired in the York district, and matured at Portsmouth and Walcheren; and the order and method of the military hospitals gradually assumed a new aspect. In these reforms he was also so fortunate as to be appreciated by his great commander, who hitherto had received so little support from the heads of the several departments of the military service, that he had been obliged to perform their duties as well as to command the army. Under such encouragement

the sick and wounded were duly cared for, while the studied delays of convalescence found no quarter; even the paradise of the sick at Lisbon was broken up, and its tenants healed as if by miracle. Henceforth no sick nor wounded were to be sent to the rear of the army, except on the proceedings of boards of medical officers, subject to the approval of Dr. M'Grigor, and such sick as were sent to Lisbon, if not cured within a limited time, were to be embarked for England. In these measures the general and he were completely at one; and from the efficiency of the army under such a system, no small share of the merit belonging to the great victories of the Peninsular war might justly be attributed to the toilsome but unostentatious labours of the doctor. The only case in which they appear to have disagreed was in the proposal of the latter to prevent the accumulation of the sick and wounded in the rear of the army; for which purpose he suggested that each regiment and brigade should have its own hospital for slight cases of disease and wounds, and that conveyance for the hospital establishment should be provided for each corps and brigade. Here the science of healing and the science of war were in opposition, and Wellington exclaimed warmly against a plan that would clog the movements of his army, declaring that he would have no vehicles except for the conveyance of his guns. A few days afterward, his lordship, adverting to the plan, said it was excellent if it had been practicable, because it was "lamentable to see so many men slightly ill or wounded sent constantly to the rear, and thus diminishing the force of the army in a greater proportion than the reinforcements from England were adding to it;" but he closed all with, "I cannot risk encumbering the army and impeding its movements either in advancing or retiring." Preparations were now made for the siege of Badajoz; and while the troops and their artillery were set in motion, the hospitals and their stores had also to be got in readiness. The quarters occupied by M'Grigor and his medical staff at Castello Born were so wretchedly uncomfortable, that this change to the dangers and hardships of a siege was felt as a relief. At Elvas he established his office; on the ground of the encampment he set up a small field-hospital; and for his comfortable accommodation when detained at night upon the field, Lord Wellington kindly caused a tent to be pitched for him near his own, where he could be furnished with some straw for a bed and two blankets. The destructive character of the siege kept the doctor and his numerous staff in constant occupation, and but for his prewise cares, would have far exceeded the means of remedy. At last Badajoz was taken by storm, and the atrocities that followed were such as to annihilate the glories of the capture. British soldiers, maddened by the resistance they had overcome, and inflamed with wine, seemed to surpass the fiends themselves in deeds of horrid iniquity, and full swing was given to the most revolting excesses of revenge, wanton cruelty, and lust. And all the while their officers were helpless to restrain them; even Wellington's life was endangered by the soldiers when they fired what they called a *feu de joie* in his honour. When M'Grigor walked through this pandemonium he saw that the Connaught Rangers, who had been foremost in the siege and storm, were now the wildest and the worst in these excesses; and when he expostulated, they raised their muskets, and were only prevented from firing at him by his reminding them that he too had been an old Connaught Ranger. Within the fortress he found a considerable number of killed and wounded; but from what he had witnessed he did not

doubt that the greater number of these had been occasioned by the drunken brutality of our own soldiers. After he had taken an account of the cases both within and without the walls, and made arrangements for their treatment, he entered the tent of Wellington with his report, and found his lordship writing the despatches. At such a favourable moment the doctor ventured to plead in behalf of the medical staff: "I trust, my lord, you are satisfied that the medical officers during last night did their duty, as well as the military officers, and that you will receive my testimony that they discharged their arduous and laborious duties most zealously, and often under circumstances of personal danger of which they were regardless." "I have myself witnessed it," replied the general. M'Grigor then said to him, "Nothing could more gratify those officers, nothing could be a greater incentive to their exertions on future occasions, than his noticing them in his public despatches." "Is that usual?" asked Wellington. The doctor, without directly answering the question, said, "It would be of the most essential service;" and ventured to add, "that really their extraordinary exertions gave them in justice a claim to this." Wellington rejoined, "I have finished my despatches—but, very well, I will add something about the doctors." This he amply and honourably did, and when the gazette appeared the medical officers of the army in England were delighted to find that the merits of their brethren were publicly recognized and acknowledged as well as those of the military officers. It was the first time this had been done, and ever since the example has been followed both in the army and navy.

Although the toils of the military officers are succeeded after victory by rest and enjoyment, there is no such intermission for the medical department of an army; and their labours, which were great both before and during the siege of Badajoz, were multiplied tenfold after the town was taken. Even the wreck and ruin produced by success is frightful, and the wounds of the victor are often of deadly character. Having gathered up the surviving relics of the storming of Badajoz, and seen them properly accommodated and placed in the way of recovery—for which purpose every church, monastery, convent, and public building at Badajoz and Elvas had to be converted into an hospital—M'Grigor followed the movements of the commander-in-chief. He was present at the battle of Salamanca, after which his labours were so arduous that he was obliged to remain there until he was recalled by positive orders to head-quarters. On his way he found many of the sick and wounded of our army, both officers and soldiers, who were not only without medicines and medical attendance, but without food; and as they were sinking fast under their privations, he wrote to Salamanca for a supply of medical and purveying officers, and also a supply of provisions to each of the places he had visited. On arriving at Madrid, which was the head-quarters for the time, he waited upon Lord Wellington, who was then in the act of sitting for his portrait by a Spanish artist, and to whom he gave a detail of the state of the wounded at Salamanca, and of those whom he had visited on his way to the Spanish capital. "But when I came," adds the doctor, "to inform him that for their relief I had ordered up purveying and commissariat officers, he started up, and in a violent manner reprobated what I had done. It was to no purpose that I pleaded the number of seriously ill and dying I had met with; and that several men and some officers had died without ever having been seen by a medical officer. I even alluded to what had formerly occurred at Talavera,

and to the clamour raised in England when it was known that so many wounded and sick had been left to the mercy of the enemy. All was in vain. His lordship was in a passion, and the Spanish artist, ignorant of the English language, looked aghast, and at a loss to know what I had done to enrage his lordship so much. 'I shall be glad to know,' exclaimed his lordship, 'who is to command the army? I or you? I establish one route, one line of communication for the army; you establish another, and order the commissariat and the supplies by that line. As long as you live, sir, never do so again; never do anything without my orders.' I pleaded that 'there was no time to consult him to save life.' He peremptorily desired me 'never again to act without his orders.' Hereupon I was about to take my leave, when, in a lower tone of voice, he begged I would dine with him that day, and of course I bowed assent."

After this fortune turned against the British arms, and Lord Wellington was compelled to retreat from Burgos, after unsuccessfully besieging it. Before he had given orders for this dispiriting movement, he sent for Dr. M'Grigor, to whom he communicated the unpleasant intelligence, saying, that he must leave the place on that very night; "but what," he anxiously added, "is to become of our sick and wounded?" The doctor's reply tranquillized him in this matter. Seeing that his lordship was so much troubled with the siege, he had of his own accord enlisted every cart and mule that came with provisions to the army, to carry off his sick and wounded patients in return to the hospitals he had established at Valladolid, so that only about sixty would be left behind whose condition would not bear removal. This relieved Wellington's anxiety, and that evening the retreat was commenced. On reaching Valladolid his lordship's disquietude about the sick was removed, for the hospitals there had lately contained 2000 patients whom he could neither protect nor leave behind. But the doctor had used the same provident care which he had exercised at Burgos; he had again put every cart and mule in requisition, and forwarded them to Salamanca, so that not more than 100 soldiers and officers would be left behind. "And you have made Salamanca choke full? I cannot stop there." "No, they are in movement from Salamanca on Ciudad Rodrigo, and from that to the Pise hospital buildings which we erected near the Douro, and move from thence on Oporto, with instructions to the principal medical officer there to have them in readiness for embarkation should that be necessary." Thus while Lord Wellington had been conducting the retreat of the army, M'Grigor had been providing for the more difficult retreat of the sick and helpless, and had conducted it with such admirable foresight, that they were placed in safety without encumbering the march of the troops. During this interview Lord Wellington was at a post on the bridge against which the enemy kept a very heavy cannonade, and in the upper floor of a small house which was riddled with shot. Hearing that the sick and wounded were thus disposed of, he exclaimed in a transport, "This is excellent! Now I care not how soon we are off." It was now time for M'Grigor to justify these proceedings, which had been undertaken on his own responsibility. "My lord," he said, "you recollect how much you blamed me at Madrid for the steps which I took on coming up to the army, when I could not consult your lordship, and acted for myself as I had done." "It is all right as it has turned out," replied Wellington; "but I recommend you still to have my orders for what you do." When the army in its retreat had passed the

bridge of Salamanca, the doctor was temporarily lamed by the kick of a horse. No sooner did Wellington hear of this disaster, than he kindly put his own carriage at M'Grigor's service, although it was the only carriage in the army.

The same wisdom and provident care distinguished the professional arrangements of Dr. M'Grigor during the whole of the retreat, and when the army got into quarters; and in reading his statements we can easily perceive that the handling of troops in the march or the battle is by no means the most difficult portion of a campaign. "Nothing is so unmanageable," said the Duke of Wellington, "as a British army in retreat or when foiled;" it is then that the self-will and sullenness by which the three nations that compose it are characterized, and above all, the tendencies to brutish intemperance of English, Scotch, and Irish alike predominate; and as if in revenge of disaster or defeat, the soldiers are apt to march their own way in defiance of orders, and get drunk as soon as possible. Thus it was in the retreat of Sir John Moore to Corunna, and the retreat of Wellington from Burgos; and when the army of the latter had reached winter-quarters, contagious diseases and mortality, the effects of intemperance, prevailed to a frightful extent, while compared with them the number of medical officers was very small, and the hospital accommodations not large enough for a tenth part of the sick. These were the trying difficulties which M'Grigor had now to encounter, and they were bravely met and overcome. At his suggestion every medical officer on leave of absence was ordered to return from England without delay; and as some time must elapse before they could arrive, he engaged the services of all the medical Spanish and French officers he could find, alluring them with the amount of English pay, which was greater than their own—and the French doctors who were prisoners of war were stationed in our hospitals in the rear, that they might not be tempted to desert to their countrymen. The scantiness of hospital accommodation was counteracted by his establishing regimental hospitals, which he quietly introduced, notwithstanding the previous opposition of Lord Wellington when the plan was first proposed. Now, however, they were found not only so absolutely necessary, but so beneficial in the saving of life and the expeditious cure of diseases, that the whole army were convinced of their propriety. The army was restored to a state of efficiency; but by whom was it saved, and prepared for future triumphs? The following intimation in M'Grigor's autobiography can answer the question: "During the time we were in quarters, the chief duty of the army fell on the medical officers, which was most laborious, in some cases overwhelming; and in a great many instances the medical officers fell a sacrifice to their zeal and humane exertions. Worn down by the harassing fatigue they underwent, they were seized frequently with the contagion of the typhus fever they were treating, and too often fell a sacrifice to it."

Although thus much had been effected, the careful forethought of Dr. M'Grigor was still careful about the evils that loomed in the future. Another campaign was to open; and he suggested to Lord Wellington that should its operations be more extended, or even be upon the same scale as the last, and at a distance from large towns, the want of general hospitals would be felt for such cases of disease and wounds as could not easily bear conveyance. The temporary erection of buildings at no great distance from head-quarters was proposed, that might contain 5000 men; but the difficulty of finding materials was the chief obstacle. M'Grigor mentioned, among

other matters, that when he went to the West Indies with Sir Ralph Abercromby's expedition, government had sent out with it wooden buildings for hospitals in framework, which, on being landed, required only to be put together by carpenters, and that a day might suffice for erecting them. Nothing more at the time was said upon the subject, to which his lordship did not seem to pay particular attention; but not long after, when the doctor called one morning with his official report of the sick, Lord Wellington said, "By the by, your hospitals are ordered out, and may soon be expected. By a despatch from Lord Bathurst, which I received by the English mail, sent to head-quarters this morning, I find that they ordered them instantly, and were embarking them in three vessels; with two master carpenters and twelve carpenters to put them up and take them down, and to teach our artificers how to do this; but they will be a vast expense to the country." The doctor was surprised at the sagacity with which his lordship had seized the idea, and at his promptitude in following it up. A proper place was selected, and by M'Grigor's plan laid out for the occasion; an hospital-village was set up, consisting of several streets of small houses or cottages, such as are called *Pise* buildings. So many of the sick were beyond expectation recovered to join the ranks, in addition to the reinforcements from England, that Wellington in high spirits commenced the campaign which terminated so triumphantly at Toulouse. Much of this medical zeal, diligence, and professional skill, by which such a result was produced, was owing to the diligence of Dr. M'Grigor for the improvement of this department of the service, and the carefulness with which he recommended the deserving officers for promotion—recommendations which Lord Wellington always carried out with the home government. Of these medical officers it was indeed said that they had decided the day at Vittoria; for without the 4000 or 5000 convalescents which they had restored to the British army, the battle might either have not been won, or not have been attempted.

It is unnecessary here to follow the course of events from the battle of Vittoria to the fall of Bordeaux and the advance upon Toulouse, in which M'Grigor accompanied the army, and shared in not a few of its dangers. On the morning of the surrender of Toulouse he was sent by the Duke of Wellington into the town for the purpose of procuring from the magistrates accommodation for the wounded of the allied army. It was no trivial or easy matter, as more than 5000 wounded men required to be comfortably housed and nursed. On entering Toulouse the doctor was astonished and well-nigh frightened at the fervour of his welcome, for thousands blocked up his passage, and rent the air with their shouts of *Vivent les Anglais*. Mystified and bewildered by this reception he knew not what to conclude, until he was relieved by an English officer who stood by laughing heartily, and who told him that the people had mistaken him for the Duke of Wellington himself! To accommodate his army of patients, not only the town's hospitals had to be put in requisition, but also the convents, nunneries, churches, and even many of the private houses. By this time also the British medical officers were in such a complete state of efficiency as to be greatly in advance of those of other countries, and this fact was illustrated in a way that was highly gratifying to Dr. M'Grigor. Among the sick and wounded soldiers under his charge in Toulouse, were not only British soldiers, but those of our allies, and also of the French; but in every case these last preferred the services of British practitioners to those of their own.

During the peaceful occupation of Paris by the allied armies, the time of Dr. M'Grigor was chiefly spent in travelling through different districts of the country, not, however, as a mere pleasure-seeker, but to examine their military hospitals with a view to the improvement of his own. He returned, however, to Toulouse with the conviction that they had nothing particularly worthy of copying. On his return an agreeable surprise awaited him. The medical officers had entered into a subscription to present him with a service of plate valued at nearly 1000 guineas, which was subsequently presented to him in London. "What greatly enhanced," he says, "the value of this gift was, that it was voted and presented at a time when the donors of it ceased to be under my control, when they could expect neither further approbation nor advantage from serving under me; in fact, when the tie was broken between us, and when we were about to be widely separated." On returning to England his services were recognized by a retiring allowance of £3 per day, and the honour of knighthood. His active mind, however, could not rest in retirement, or upon the distinctions he had already won, and he resumed the study of two of his favourite branches—anatomy and chemistry, attending for that purpose the lectures of his old teacher Mr. Wilson, in the Hunterian school, Windmill Street, and Mr. Brande, the lecturer on chemistry. But although independent he must have an occupation, and he was about to set up as a physician in London, when he was unexpectedly appointed director-general of the army medical department, through the patronage of the Duke of York. Although the office was alluring, he might have hesitated to accept it, but for one inducement sufficiently characteristic of the man. "This," he says, "was my extreme desire to accomplish fully the object which I had entertained for many years, viz. to turn the reports and returns rendered by the medical officers of the army to the account of science and the improvement of the officers themselves; instead of devoting them, as was the fashion of the day, to the fiscal concerns of the department, to the economy and the minute expenditure on account of the hospitals; in fact, to pounds, shillings, and pence, and that almost entirely. It was notorious," he adds, "in the army, and had even become cause for ridicule among military officers, that the subject-matter of the correspondence of the board, as shown by the correspondence-book of the regimental medical officers, turned wholly upon those details."

This generous purpose Sir James M'Grigor proceeded to realize as soon as he commenced the duties of his appointment. He issued forms to the surgeons of all the regiments in Great Britain and Ireland, and to the heads of the medical staff at all the colonial stations, requiring their transmission of half-yearly and annual reports to the medical board in London, detailing the health and condition of the troops, the diseases prevalent among them, and the modes of treatment pursued—and when any of these cases were of unusual interest he transmitted queries to obtain further information. In these periodical returns he obtained information of the average duration of a soldier's life in different climates, the causes of each disease, their best mode of treatment, and the mortality produced in particular years by yellow fever, cholera, and epidemics. He also learned the effects of any new sanitary measure or treatment introduced for the purpose of preserving the health of the troops or facilitating the recovery of the sick; and these beneficial measures he could direct to be used wherever they might be necessary. These

medical reports were of a very different character from those huckster-like accounts of the expenditure of rhubarb, oatmeal, lint-plaster, &c., to which the medical statistics of the army had hitherto been chiefly restricted; and during the thirty-five years that Sir James held the office of director-general, these records amounted to fifty bound folio volumes, each duly lettered with the name of the colony or district to which it related—forming in themselves an invaluable library of military medical statistics. So highly indeed were these volumes appreciated, that they were eventually published with the aid of the War Office.

This admirable combination of enthusiasm, perseverance, and method which had distinguished Sir James M'Grigor through life, and which he brought so fully to bear upon the duties of his department, were not confined within his own professional range: he was desirous that long after he had passed away the effects of his labours should still survive, and a new generation of army-surgeons be raised, abler still and more enlightened than his contemporaries. Accordingly he exerted himself in the formation of the museum of anatomy and natural history, bearing upon military surgery, at Fort Pitt, Chatham, and to him the prosperous condition to which it had attained at his retirement from office was mainly owing. In consequence of his influence with the medical officers of the army, and his successful applications in behalf of the museum, it comprised at the time of his retirement 5888 specimens in natural, morbid, and comparative anatomy, and comparative physiology; 19,262 specimens of the three different classes of the animal kingdom; 8561 specimens of the vegetable kingdom; 6891 specimens in mineralogy and geology; 988 works of art—and more than 500 human crania, declared to be a collection of skulls unequalled in any other museum in Europe. Attaching also a library to the museum, he gave it repeatedly gifts of books, bestowing at one time 1500 volumes, and inducing his scientific brethren to follow his example. In 1852 the library contained 10,000 volumes.

Besides these scientific institutions to facilitate the training of efficient medical officers for the army, Sir James M'Grigor originated those which provided for the comfort and respectability of the profession. Impressed by the destitution which often, on the death of a medical officer, awaited his wife and children, Sir James in 1816 established the "Army Medical Friendly Society." For this purpose he induced the medical officers, soon after they had entered the service, to subscribe annually to the society; and so apparent were its benefits, that when Sir James retired, it was distributing incomes among 120 widows, and possessed a capital of nearly £80,000. Another similar institution which he founded was that of the "Army Medical Benevolent Society," for the relief of the more necessitous families of medical officers, especially of orphans, by private assistance; and to this society he was a liberal contributor while he lived. At his retirement its capital amounted to nearly £15,000.

It will thus be seen that the public honours which continued to accumulate upon Sir James M'Grigor to the end of his public career were for present as well as past services, and were also deservedly bestowed. He was made a knight-commander of the Tower and Sword of Portugal for his services in the Peninsular campaign, and permitted by his majesty to wear the Turkish order of the Crescent for the offices he rendered in the Egyptian campaign. In 1831 he was created a baronet. In 1850 he was invested with the order of a knight-commander of the

Bath. His literary and civic distinctions were also numerous. He was appointed a member of council in the London university; he was a fellow of the Royal Society of London, and a member of various societies of Dublin and Edinburgh, and of several societies on the Continent. He was elected by his alma mater, the Marischal College of Aberdeen, its rector in 1826 and 1827, and again in 1841. It was there also that he was one of the founders of the Medico-Chirurgical Society of Aberdeen. In 1826 he was honoured with the freedom of the city of Edinburgh, in the university of which he had been a student.

To the last Sir James M'Grigor was an indefatigable labourer in his duties as medical director-general. He rose at an early hour in the morning, and after transacting much of its business at home in the form of correspondence, &c., he repaired at ten o'clock in the morning to his office, and there was busily employed until five in the afternoon. Such an amount of labour he did not feel too much in attending to the health of our troops in so many near and distant stations over half the world. Thus he had continued his director-generalship for thirty-three years, until feeling in 1848, when he had reached the peaceful age of seventy-seven years, that longing for rest and retirement to which the most active are at last reduced, he expressed to the Duke of Wellington, then commander-in-chief, his wish to retire from office. But the "iron duke," who was the senior of Sir James by two years, and who regarded him as an iron doctor, answered, "No, no, M'Grigor; there is plenty of work in you yet." It was a characteristic reply from the energetic old soldier, who was still ready for the field should his country require it. He could not also endure the thought that the man whom he valued so highly, and who had contributed so greatly to his victories, should now be lost to the army, and at his remonstrance Sir James continued in office two years longer. But at the close of 1850 he was compelled to tender his final resignation, which was reluctantly acquiesced in at the Horse Guards, with many professions of sorrow and attestations of his valuable services; and when he retired from office in the spring of 1851, the officers of his own department resolved to express their esteem by presenting him with a costly testimonial. But this he intimated that he could not accept after their former munificent token, and accordingly they presented, instead of it, a valedictory address signed by upwards of five hundred members. After this a tranquil old age succeeded, which only terminated on the 2d of April, 1858, when he had nearly completed the eighty-eighth year of his age.

It is evident from the nature of his active life, spent in so many climates, that Sir James M'Grigor could have little of what is called learned leisure for indulgence in authorship, and he slightly alludes in his autobiography to the *Medical Sketches of the Expedition from India to Egypt*, which he published a short time before he joined the Blues. The continuator of his biography, however, mentions the following productions as having also proceeded from his pen:—*Memoir on the State of Health of the 88th Regiment and of the Corps attached to it, from June, 1800, to May, 1801*. Presented to the Bombay Medical Board, 1801.—A letter in reply to Dr. Bancroft who had published *Some Strictures on the Fifth Report of the Commissioners of Military Inquiry*. 1808.—In 1810 he published in the sixth volume of the *Edinburgh Medical and Surgical Journal* some valuable information on the fever which appeared in the army on its return from Spain to England in 1809.—

"*Statistical Reports on the Sickness, Mortality, and Invaliding among the Troops in the West Indies*; prepared from the Records of the Boards of the Army Medical Department and War Office Returns." Folio, 1838.—*Statistical Reports on the Sickness, Mortality, and Invaliding among the Troops in the United Kingdom, the Mediterranean, and British America*. Folio, 1839.—"Sketch of the Medical History of the British Armies in the Peninsula of Spain and Portugal during those Campaigns." This important and interesting publication was a paper which appeared in the sixth volume of the *Medico-Chirurgical Transactions*.

MACINTOSH, CHARLES, F.R.S., an inventor of several chemical manufactures, was born at Glasgow, December 29, 1766. He was the son of Mr. George Macintosh, who introduced the manufacture of cudbear and Turkey-red dyeing into Glasgow. His mother was the daughter of the Rev. Charles Moore of Stirling, the brother of Dr. John Moore, author of *Zeluco*, and her nephew was Lieutenant-general Sir John Moore, K.B., who fell in the disastrous retreat at Corunna. Charles received the elements of his education in his native city, and afterwards was sent to a school at Catterick Bridge, in Yorkshire. On his leaving the latter he was placed in the counting-house of Mr. Glassford of Dugaldston, to acquire habits of business. He studied chemistry under the celebrated Dr. Black, then settled in Edinburgh, and turned his knowledge to practical account at an early period, having embarked in the manufacture of sal-ammoniac before he had attained the age of twenty. He subsequently introduced from Holland into this country the manufacture of acetate of lead and acetate of alumina, employed in calico-printing. In 1797 he was associated with Mr. Charles Tennant, then a bleacher at Daruley near Glasgow, in working the patent for the production of chloride of lime in the dry state and in solution, since employed so extensively as a bleaching agent. In the same year he became a partner in a firm at Hurler for the manufacture of alum from alum-schist; and in 1805 similar works, on a larger scale, were established by the same company at Campsie. On the death of his father in 1807, Mr. Macintosh took possession, with his family, of the house at Dunchattan, near Glasgow (but now in Glasgow), where he continued till the end of his life to prosecute his chemical researches. In 1822 he obtained a patent for his celebrated invention of the waterproof cloth distinguished by his name. With a view to the obtaining of ammonia to be employed in the manufacture of cudbear, Mr. Macintosh in 1819 entered into a contract with the proprietors of the Glasgow gas-works, to receive the tar and other ammoniacal products of the distillation of coal in gas-making. After separating the ammonia, in converting the tar into pitch, the essential oil named naphtha is produced; and it occurred to the inventive mind of Mr. Macintosh to turn this substance to account as a solvent of caoutchouc or india-rubber. He succeeded in producing a waterproof varnish, the thickness and consistency of which he could vary, according to the quantity of naphtha employed in the process. Having obtained a patent for this process, he established a manufactory of waterproof articles, which was first carried on in Glasgow, but was eventually transferred to a partnership in Manchester, under the name of Charles Macintosh & Co. In 1828 Mr. Macintosh joined a copartnership in working the hot-blast patent of Mr. J. B. Neilson. He first established in Scotland the manufacture of Prussian blue

and prussiate of potash; invented the mode of topical printing of calico, silks, &c., by the application of the caoutchouc and naphtha varnish; and invented and patented a process for converting iron into steel, by means of carburetted hydrogen gas. Mr. Macintosh closed a career of great usefulness to science and the arts on the 25th of July, 1843, in his seventy-seventh year.

MACINTYRE, DUNCAN, one of the best of the modern Highland poets, was born in Druimlaighart, in the district of Glenorchy, Argyshire, on the 20th March, 1724. He was the child of poor parents, and never received the slightest tincture of school learning. He was engaged in the civil war of 1745, but on the loyal side. Local and family ties made him a member of the large force which Argyshire sent forth on that occasion to support the government, and he fought at the battle of Falkirk under the command of Colonel Campbell of Carahin. It is not to be inferred on this account that he had any antipathy to the cause in which so many of his countrymen were engaged. He was involved in the disgraceful retreat of the king's troops, in which he lost his sword—circumstances which gave him no small degree of mortification, as he has himself shown by the clever song which he wrote upon the occasion. At what period of his life he commenced the composition of poetry is not known. His only models in the art must have been those legendary verses of various kinds and ages which the Highlanders used to recite by the winter fireside, and hand down from one generation to another by oral communication.¹ Of the grammatical principles of language he must have been completely ignorant; his knowledge would be confined in a great measure to the objects of his own Highland vale, and to the Scriptural lore which he would hear occasionally expounded in the parish church. He possessed, however, the genuine talent of the poet—not only that natural eloquence which supplies imagery and suggests incident and allusion, but that felicitous power of expression, which from its being alike found in the untutored Burns and the refined Horace, ought to be considered as much a native gift as any other. This poor Highlander—the reader cannot conceive any man poorer in the goods of fortune—is said to exhibit in his poetry a purity and aptitude of diction, and a harmony of versification, such as are not surpassed in the poetry of any age or country. He may not only indeed be introduced here as a Scotsman who has earned a respectable fame, but he might be instanced, in works more expressly devoted to the consideration of the intellectual powers of men, as a singular specimen of original and brilliant talent, altogether unfavoured by direct instruction, and going contentedly side by side for a long life with a character of the most simple and unworldly kind.

Being an excellent marksman, Duncan—or, as he was generally styled by his countrymen, Donacha Ban—(fair-haired Duncan)—was appointed forester to the Earl of Breadalbane in *Coire-Cheathaich* and *Bein Dourain*, and thereafter to the Duke of Argyll, in *Brachill-Gie*. In 1768 a volume of his poems was published at Edinburgh, under the descriptive title of *Orain Ghaidhealach, le Donacha Mac-an-t-soir*;² it was reprinted in 1790, and again in 1804.³

¹ There was not a printed book in the Gaelic language which contained any sort of poetry except the Psalms, until Alexander Macdonald published his *Gaelic Songs* in 1751.

² *Gaelic Songs*, by Duncan Macintyre.

³ With some additional poems composed during these intervals.

and has long been out of print. One of the poems in this volume was "Oran na Briogais," or, as it may be freely rendered, "The Anathema of the Brecks," being a pretty open expression of the most disloyal sentiment on the part of the author respecting the abolition of the Highland, and the substitution of the Lowland dress, which formed one of the measures of the government for breaking the Jacobite spirit, after the rebellion of 1745. It is well known that the Highlanders in general resented this measure very bitterly; and none more so than such as, like Macintyre, had been loyal to the king during the late broils. They deemed the breeches at once a literal and emblematic restraint—a thing unsuited to their habits as well as tastes—and, as is plainly intimated by Donacha Ban, a sufficient cause of offence to cause a *universal* rising in favour of Prince Charles, should he ever again appear in the country. Of the spirit of this poem we can give no fair specimen—though the first stanza has been cleverly rendered in the following terms:—

"My curse upon the gray brecks
That bind our supple limbs so light!
We're fetter-bound in slavery;
And right is now o'ercome by might.
Had we been faithful to our king,
We ne'er should have to dree such thing,
But light's a bird upon the wing
Might be each free-born mountain wight."

When, by the exertions of the Marquis of Graham, the act for abolishing the Highland dress was repealed (1782) Macintyre celebrated the event in a poem of clamorous joy, such as would have done honour to a repelled invasion or a liberated country. These poems, with an English translation, are to be found in the *Cambrian and Caledonian Magazine* for October, 1833.

In 1793 the poet, though advanced to a considerable age, became a private in a fencible regiment then raised by the Earl of Breadalbane, in which situation he continued till the corps was disbanded in 1799. It is probably to a period antecedent to either of these dates that we are to ascribe an anecdote of Macintyre, which was related to the editor of this Dictionary by the late Mr. Alexander Campbell, editor of *Albyn's Anthology*. The Earl of Breadalbane being anxious to provide permanently for the latter life of his ingenious dependant, consulted the poet himself as to the way in which he thought that object might be best accomplished. Macintyre, whose whole life had been passed in the humblest obscurity, undisturbed by so much as a wish for anything better, took some time to consider the matter, and to make inquiries; and then came to his lordship with a request that he would exert his influence to procure a place for him in the city-guard of Edinburgh, a military police whom Sir Walter Scott has since rendered classical by his pen, but who were then the alternate scoff and terror of their fellow-townsmen, at *sixpence a day*! Into this antiquated corps—for such it was, both in its general character and in respect of the age of most of its members—Macintyre was accordingly transplanted;⁴ thus exchanging the Highland solitude, whence the inspiration and enjoyment of his whole life had been derived, for the duties of a peace-officer in one of the most crowded streets in the world, where every object must have been to him artificial and strange. It is an affecting illustration, however, of the pleasure which unambitious minds may derive from humble sources, that the poet wrote upon this occasion

⁴ He composed a poem in Edinburgh, in which he shows the poetical talent of nice observation, describing every remarkable or novel object, but without any expression of surprise.

a self-gratulatory ode, in which he expresses quite as bounding a transport at his accession to a salary of sixpence a day as Napoleon could have done at the addition of a kingdom to his dominions. We have thought this poem so extraordinary a curiosity in its way as to make a translation of it, with which we have been furnished by an obliging friend, the example to be presented in this place of the style of Macintyre, so far as the unavoidable formality and tameness of a literal English version can exemplify the exquisite graces of the Gaelic bard.

TRANSLATION OF VERSES TO HIS MUSKET.

BY DUNCAN MACINTYRE.

Many a turn of fortune may happen to a man,
He may fall in love with one he may not get—
I devoted twenty years to the first I fancied,
But she forsook me and I was left alone.

I came to Edinburgh to seek a sweetheart;
Said Captain Campbell in the town-guard,
That he knew a widow in a secret place,
And would endeavour to put her in my way;

He did, as he was wont, fulfil his promise;
He gave her to me by the hand, and her portion with her.
Whoever may ask her name or surname,
They call her Janet,¹ and George was her grandsire.

She is quiet and affable, without gloom or vexing look,
And as high in rank as any lady in the land;
She is the means of my support since she joined me—
Great is the cause of grief to him who has not got her.

I have forsaken Nic-Cosum,² though she still lives,
And allowed the crested stags to wander where they please;
I have chosen a young wife, which I do not repent;
I am not without wealth since I espoused the fair one.

I pass my word that she is most excellent,
And that I never discovered any hidden fault in her;
She is stately, fine, straight and sound,
Without defect or blemish, twist or bend.

When needy folks are pinched for money,
George's daughter will not let my pocket be empty;
She keeps me in drink in the alehouses,
And pays every stoup that I call for.

She does every turn as I bid her,
She tells me no lie nor false story;
She keeps my family as well as I could wish,
Though I do no labour nor dirty work.

I worked laboriously though I amassed no wealth,
I vowed that I would disdain to be a menial;
I have ceased to toil since I have remarked
That the idle man endures longest.

It is my loving wife who will not deceive me;
She is able always to earn my bread;
I shall have no lack of clothes or linen;
And worldly cares now give me no concern.

How long he remained in the situation alluded to has not been ascertained. The latter years of his life were spent in Edinburgh, and are said to have been cheered by the bounty of the Earl of Breadalbane. He died in that city, October, 1812, in the eighty-ninth year of his age.

"In his young days," says the author of *Bibliotheca Scoto-Celtica*, "Macintyre was remarkably handsome, and throughout his whole life he possessed a very easy and agreeable disposition. Although, when provoked, his enemies generally felt the effects of his pride and resentment, yet to his benefactors he was equally grateful. He was very fond of company and a cheerful glass, and was not only very agreeable over his bottle, but also very circumspect. Although Macintyre discovered an early inclination to poetry, he did not produce anything till the memorable battle of Falkirk, a description of which forms the first song in the valuable collection published by him, wherein it is said to have been his first regular

attempt at composition. The collection contains lyric, comic, epic, and religious compositions, of such merit as renders it difficult to say in what department of poetry this writer most excelled. . . . His poetical talents justly entitled him to rank among the first of Celtic bards, for all good judges of Celtic poetry agree that nothing like the purity of his Gaelic, and the style of his poetry, has appeared in the Highlands.³ Of Donacha Ban it might justly be said,

"'Nan leabhadh eas' òg gach òran a's sgéul,
Cha chuireadh neach beò a ghlas-ghuib air a' bhéul!"

M'KAIL, HUGH. Of this young martyr for the cause of religious liberty little has been recorded, except his martyrdom itself. That, however, was an event so striking, that it stands out in strong relief among the similar events of the period, filled though it was with such atrocities of religious persecution as made Scotland for the time an Acelanda among the nations.

Hugh M'Kail was born about the year 1640. His boyhood and youth were thus spent among the most stirring incidents of the Covenant, when the patriotic and religious spirit of our country made a life of ease or indifference almost an impossibility. His studies were prosecuted with a view to the ministry, at the university of Edinburgh, and when he had entered his twenty-first year he was licensed as a preacher by the presbytery. At this time also he appears to have lived with Sir James Stuart of Kirkfield, as his chaplain.

In those days preaching behoved to be a very different matter from what it generally is at present; and when we wonder at the frequency with which public measures were introduced into the pulpit, as well as the severity with which they were often reprobated, we must remember that this was nothing more than what necessity required and duty justified. The age of journalism had not yet fully commenced; and those political movements by which the interests of religion were affected had no place of discussion or reprobation but the church, so that to "preach to the times" was reckoned the duty of the minister, not only in Scotland but in England. The pulpit was thus constrained to occupy that place from which the public press has happily relieved it. Besides, a war at this time was going on in Scotland that proposed nothing short of the utter annihilation of the national church; and every faithful minister, therefore, felt himself standing upon a watch-tower, from which he was to look anxiously over the whole country, and

³ Note by a Correspondent.—All this must be taken in a very qualified sense. There is nothing approaching to sublimity in the whole range of Macintyre's compositions. His poem in praise of Bendourain is in somewhat of a heroic strain; but it scarcely deserves the name of epic. Alexander Macdonald was far superior to him in what is usually understood by the term genius; but from his classical education he was less scrupulous about the purity of his style, and his works abound in classical allusions. It is to the purity of his language, and the harmony of his numbers, that Macintyre owes his fame in a great measure. In these qualities he is almost equalled if not rivalled by Mary Macleod, an untutored poetess, but her compositions are not so numerous, and she had not the varied talent of Macintyre. As already said, his poetry is chiefly of a descriptive character, and Dr. Johnson's criticism on Thomson's *Seasons* may be applied to him, with this qualification, that his comprehension of the vast was not equal to his attention to the minute. His love-songs are remarkable for delicacy of sentiment—and his descriptions of the chase are very animated. Here he was quite at home. Some of his pieces are valuable, as descriptive of country manners now almost extinct. He may be called the Pope of the Highlands, as Macdonald was the Byron, and William Ross the Burns. Macdonald had more originality of genius than any of the Highland poets; but it was irregular and not under proper restraint—Ross, for tenderness and sensibility, was what Burns may be supposed to have been if he had been born and bred in the Highlands. Macintyre was more agreeable.

¹ A by-word for a regimental firelock, but never applied to any other gun.

² A favourite fowling-piece to which he composed another song.

sound the alarm whenever danger approached, let the quarter from which it issued be what it might.

To this duty, so full of imminent peril, M'Kail, as a preacher, was soon summoned. The bishops who had been imposed upon the country by royal authority, complained that their offices were not respected, nor their behests obeyed; and Middleton's mad parliament had passed, under the inspiration of wine and strong drink, that sweeping decree by which 400 ministers were ejected from their charges for non-compliance. It was in September, 1662, while this measure was impending, by which the best pulpits of Edinburgh as well as Scotland at large were soon to be deprived of their ministers, that Hugh M'Kail, who had frequently officiated in the city as a preacher with great acceptance, delivered his last public sermon in the High Church, on the Sabbath before the edict was to take effect. His text was from Canticles i. 7; and in illustrating this passage as applicable to the persecutions which religion had generally endured, he declared that the "church and people of God had been persecuted both by an Ahab on the throne, a Haman in the state, and a Judas in the church." He made no particular or personal application of this general truth; he merely stated it as a well-known historical fact; but so close was the parallel to the present state of affairs, that Charles II. was found to be the Ahab, the persecuting royal favourite Lord Middleton to be the Haman, and the apostate Sharp, now Archbishop of St. Andrews, to be the Judas Iscariot whom the preacher meant. To suspect was to convict and condemn, and a party of horse was sent to his residence near Edinburgh to apprehend him. But having received a hasty notice a moment previous to their arrival, he escaped from his bed into another chamber, and managed to elude the pursuers. He fled, in the first instance, to his father's house, where for a time he was safe from detection. But as some victim was necessary, M'Kail's patron, Sir James Stuart, and Walter Stuart, his second son, were apprehended instead of the preacher, and accused of having listened to, or at least having been informed of, the aforesaid sermon, which "had maliciously inveighed against and abused his sacred majesty, and the present government in church and state, to the great offence of God and stumbling of the people;" and that, notwithstanding their knowledge of it, they had still continued to harbour and entertain its author. Both were imprisoned, and did not obtain their liberty until they had cleared themselves of the charge. In the meantime M'Kail went abroad, and, as Wodrow informs us, "accomplished himself in travelling for some years."

After a residence of four years upon the Continent, Mr. M'Kail returned to Scotland in 1666. It was not to a peaceful home that he returned, for the persecution was hotter than ever; and in the desperate insurrection which commenced at Dumfries, and ended in the defeat at Pentland, he joined the devoted band, and shared in the toils and privations of their march until they came to Cramond, on their way to Rullion Green, where his strength, unfitted for such rough service, broke down, so that he was left behind. He then endeavoured to shift for himself; but while on his way to Libberton, he was set upon by some peasants on the watch for stragglers, and apprehended, his enfeebled state, and the light rapier which he wore, being insufficient for the least resistance. This was upon the 27th of November; and on the following day he was examined by a committee of the secret council. He refused to criminate himself by answering their questions or

subscribing to their charges; but on the following day he complied so far as to confess that he had joined in the insurrection. This, however, was not enough: the rulers of Scotland were determined, for their own purposes, to prove that the rising of Pentland was a great national conspiracy, abetted by the Presbyterians of England and our enemies upon the Continent; and if proof could not be obtained from the confessions of the prisoners, it was resolved to wring it from them by torture. The selection of their victims from among the prisoners for this experiment was in keeping with the injustice of the infliction; for these were Hugh M'Kail, who had not been at Pentland at all, and John Neilson, of Corsack, in Galloway, a gentleman who, though he had been plundered of his all, and driven to the fields for his adherence to the Covenant, had yet saved the life of Sir James Turner when the latter was taken prisoner, and had behaved throughout the insurrection with gentleness and clemency. It was in vain they protested that they had already confessed all, and knew nothing of a conspiracy; the boot, the instrument of torture, was laid upon the council-table, and they were assured that on the morrow, if they still refused to confess, they should undergo its infliction. The very name of that engine can still raise a shudder in Scotland, though few are acquainted with its peculiar construction. It was a wooden frame composed of four pieces of narrow board hooped with iron, into which the leg was inserted; wooden plugs of different sizes were then successively introduced between the boards and the limb, and driven home by the executioner with the blows of a heavy mallet, while at each stroke the sufferer was exhorted to confess whatever might be demanded by the judges. In this way the anguish of the victim was increased or prolonged at pleasure, until it often happened that nature could endure no more, so that for present relief he was ready to confess whatever might bring him to the more merciful alternative of the halter.

On the following day the council assembled, and, true to their promise, they proceeded to examine the prisoners by torture. The experiment was first tried upon Mr. Neilson, and as the wedges proceeded to crush his leg at each descent of the mallet, his cries were so loud and piteous, that even savages would have melted with compassion to hear them. But not so the judges: bent upon learning the particulars of a plot that had no existence except in their own craven fears, their command at each interval was, "Give him the other touch!" As no confession was forthcoming after their worst had been inflicted, they next proceeded to deal with M'Kail, hoping perhaps to find greater compliance from his youth and gentleness of disposition. It was in vain for him to allege that he was aware of no conspiracy—that he had confessed all that he knew already: although so much time had elapsed, they still remembered what he had said about an "Ahab on the throne." His leg was placed in the boot, and after the first blow, while every nerve was tingling with the shock, the usual questions were put to him; but he was silent: the strokes were repeated, until seven or eight had been given; but to the questions he solemnly declared in the sight of God that he could reveal nothing further, though every joint of his body should be subjected to the same torture as his poor leg. This was unsatisfactory to the judges, who ordered another and another "touch," which their victim endured without a murmur of impatience or bitterness; and after ten or eleven strokes in all, and given at considerable intervals, he swooned, and was carried back to prison.

Thus no crime had been either discovered or confessed, and even according to the barbarous law of torture, it might have been thought that M'Kail should have been set at liberty, as one against whom no offence could be proved. And had he not suffered enough already to satisfy the most vindictive? But such was not the reasoning of the day, and the judges resolved to fall back upon the fact that he had joined the insurgents, and accompanied them to Ayr, Ochiltree, Lanark, and other places. It mattered not to them that he had not been present at the battle of Pentland; it was enough that he would have been there if he could, and therefore must be punished as a convicted traitor for his traitorous intentions. The day after his examination ten of these unfortunate insurgents were tried and sentenced to execution; and only five days afterwards, other seven were ordered to prepare for trial. It was resolved that among these already foredoomed victims M'Kail should be impannelled; but the torture he had undergone had thrown him into a fever, accompanied with such debility, that compearance was impossible, and this he represented while he craved a few days of delay. Nothing could be more natural than his present condition after the treatment he had experienced, or more reasonable than his request; and yet his judges would not be satisfied until they had sent two physicians and two surgeons to examine the patient, and attest "upon soul and conscience" that his case was as he had stated. Of what did these men think the bones and flesh of Covenanters to be composed, that they could endure so much, and yet recover so quickly? It would be well, we opine, if no judges were to inflict torture until they had previously tried its effect upon themselves. In this way King William adventured upon a taste of the thumbscrew, and declared that under it a man might confess anything.

On the 18th of December, while still a sufferer, M'Kail was brought out to trial. Into this we do not enter more particularly, as it was a matter of daily occurrence in the justiciary proceedings of the period. The answers he gave, and the arguments by which he justified his conduct, were such as his judges cared nothing about; and while he talked of conscience and the divine law as binding upon every community, they silenced him with the statute-book, and charged him with rebellion. The sentence, which was probably nothing else than he expected, was, that on Saturday, the 20th of December (only two days after), he should be taken to the market-cross of Edinburgh, there to be hanged on a gibbet till dead, and his goods and lands to be escheated for his highness' use. This was summary work; and three others, who were tried along with him, were sentenced to the same doom. He was then led back to the Tolbooth, the people lamenting him as he passed by, to whom he addressed the words of consolation and comfort, as if they, and not himself, were to suffer. Among others, to some tender-hearted women, who bewailed such an untimely termination of his labours, he said, "Weep not: though I am, but young, and in the budding of my hopes and labours in the ministry, I am not to be mourned; for one drop of my blood, through the grace of God, may make more hearts contrite than many years' sermons might have done." As the time allowed him to dissolve the affectionate ties of nature was so brief, he requested that his father might be allowed to visit him in prison, which was granted. And of how many such tender yet heroic partings were the cells of the Tolbooth of Edinburgh to be witnesses at this period! The meeting of father and son was accompanied with much affectionate endearment, as

well as earnest Christian prayers for support and resignation. "Hugh," said the senior, "I called thee a goodly olive-tree of fair fruit, and now a storm hath destroyed the tree and his fruit." The son deprecated this estimation as too high; but the other burst forth into the declaration that he had spoken only the truth, and that it was assuredly his own sins, and not those of his amiable boy, that had brought the latter to such a close. "It is I," he cried, "who have sinned; but thou, poor sheep, what hast thou done?" The other blamed himself that for failure in the observance of the fifth commandment, his days were to be short in the land. He added also his fear, that God had a controversy with his father for overvaluing his children, and especially himself.

During his short stay in prison M'Kail was employed in private devotion, and in the duty of encouraging and confirming his fellow-sufferers. At times, also, such was his cheerfulness that his language was full of humour. To a friend who visited him in prison, and condoled with him upon his mangled limb, he replied, "The fear of my neck makes me forget my leg." On the evening of the 19th of December, while eating his final supper with those who were to be executed with him on the following day, he said to them merrily, "Eat to the full, and cherish your bodies, that we may be a fat Christmas-pie to the prelates." After supper he read to them the 16th Psalm, and then said, "If there were anything in the world sadly and unwillingly to be left, it were the reading of the Scriptures." He comforted himself, however, with the thought that he would soon be in that place where even Scripture is no longer necessary. After writing his will, which was an easy work, as it consisted of the bequest of the few books he possessed to his friends, he slept soundly, and on waking his comrade at five o'clock in the morning, he said pleasantly, "Up, John, for you are too long in bed; you and I look not like men going to be hanged this day, seeing we lie so long." Before going to execution he bade farewell to his father, with the assurance that his sufferings would do more hurt to the prelates, and be more edifying to God's people, than if he were to continue in the ministry twenty years. Such was his heroic hope, and the history of Scotland has told us how fully it was verified.

As soon as M'Kail appeared on the scaffold, a sound of wailing arose from the numerous spectators. And indeed it was no wonder, for he had a high reputation for learning and talent, such as was rare among the persecuted of this period. He was also in much estimation for his fervent piety and steadfast devotedness. And then, too, there were other circumstances that never fail to deepen the popular sympathy at such a tragic spectacle; for besides being still in the bloom of early youth, we are told that he was a "very comely graceful person." "There was scarce ever seen," it is added, "so much sorrow in onlookers; scarce was there a dry cheek in the whole street or windows at the cross of Edinburgh." With gentleness and dignity he prepared for his departure, and after delivering his testimony, which he had written out, and sung his last psalm, he exclaimed to his friends as he ascended the ladder, "I care no more to go up this ladder than if I were going home to my father's house. Friends and fellow-sufferers, be not afraid; every step of this ladder is a degree nearer heaven."

Having seated himself mid-way, M'Kail addressed the spectators with his parting farewell. He expressed his belief that all this cruelty which drove so many to the scaffold, was not so much owing to

the Scottish statesmen and rulers as to the prelates, by whom the persecution was urged onward, and at whose hands the blood of the sufferers would be required. He then declared his cheerful readiness to die for the cause of God, the covenants, and the work of reformation, once the glory of Scotland. Here, on being interrupted by loud weeping, he told the people that it was their prayers not their tears which were needed now. After expressing his triumphant assurance of the bliss into which he was about to enter, and consoling them with the thought, he suddenly broke off into the following sublime prophet-like declaration, which has so often stirred the heart of Scottish piety to its lowest depths: "And now I leave off to speak any more to creatures and begin my intercourse with God, which shall never be broken off. Farewell father and mother, friends and relations, farewell the world and all delights, farewell meat and drink, farewell sun, moon, and stars! Welcome God and Father; welcome sweet Jesus Christ, the mediator of the new covenant; welcome blessed Spirit of grace, and God of all consolation; welcome glory, welcome eternal life, and welcome death!"

Such was the departure of Hugh M'Kail, standing upon an ignominious ladder, and yet upon the threshold of heaven, and all but glorified before he had departed. And below was a crowd among whom nothing was heard but heavy groans and loud lamentation. It was a death such as only a martyr can die, and which the living might well have envied.

MACKENZIE, SIR ALEXANDER. In the list of those who have explored the wild recesses of North America, and acted as the pioneers of Anglo-Saxon civilization, the name of Sir Alexander Mackenzie occupies a place inferior to none. Originally, however, an obscure mercantile adventurer, we are unable to ascertain the early training through which he not only became such an enterprising and observant traveller, but so excellent a writer in the account he has left of his journey. He is supposed to have been a native of Inverness, and to have emigrated to Canada while still a very young man. The first account we have of him is from himself, in his general history of the fur trade prefixed to the narrative of his travels, when he held a situation in the counting-house of Mr. Gregory, one of the partners of the North-west Fur Company. After he had been in this situation for five years, Mackenzie, in 1784, set off to seek his fortune at Detroit, having been intrusted for this purpose with a small venture of goods, on condition of proceeding to the back settlements or Indian country in the following spring. He accordingly set off on this half-mercantile half-exploratory journey with a party of associates; but on arriving at the scene of enterprise, they soon found themselves regarded as intruders by those Europeans who had established themselves in the country and full pre-occupation of the trade, and who not only opposed their progress, but stirred up the natives against them; and after the "severest struggle ever known in that part of the world," in which one of the partners of the company was murdered, another lamed, and a clerk shot through his powder-horn, by which the bullet was prevented from passing through his body, the jealous occupants at last admitted the new-comers to a share in their trade in 1787.

The acquaintanceship which Mackenzie had acquired of the country and the native tribes, during a residence of several years at Fort Chipewyan, situated at the head of the Athabasca Lake, in the territory of the savages to the west of Hudson's Bay,

and the intelligence, courage, and enterprising character which he had already displayed, pointed him out to his employers as a fit person to be sent out on an exploring expedition through the regions lying to the north-west of their station—at this time still a *terra incognita* to British exploration, and supposed to be bounded by the Arctic Ocean. Upon this Argonautic quest he accordingly set off in a canoe of birch bark, from Fort Chipewyan, on the south side of the Lake of the Hills, on June 3, 1789. His crew consisted of a German, four Canadians, two of whom were attended by their wives, and an Indian chief; and in a smaller boat were the chief's two wives, and two of his young men who were to serve as hunters and interpreters: a third canoe that followed was in charge of one of the company's clerks, and carried also their provisions, clothing, and ammunition, as well as mercantile presents for the Indians along whose territories they would have to pass. This voyage, which continued 102 days, was of a sufficiently eventful character; and the difficulties, dangers, and privations which the party encountered, as well as the courage, wisdom, and perseverance with which Mackenzie encountered and surmounted them, can scarcely be appreciated in the present day, when the districts which he visited have now become familiar, while the wild tenants by whom they were occupied have disappeared. Six days after he had embarked on the Slave River he reached the Slave Lake, that was almost wholly frozen over; and after encamping six days among the ice, that sometimes gave way under them, he once more embarked, and skirting along the edge of the lake, he reached, on the 29th of June, the entrance of the river which flows from its western extremity, afterwards called, in honour of his discovery, the Mackenzie River. On the 15th of July the principal purpose of his search was crowned with success; for after having followed the north-west course of the river, he arrived at the great Northern Ocean, in lat. 69°. After having erected a post at the place of discovery, on which he engraved the latitude of the place, his own name, and the number of persons who accompanied him, he retraced his course, and arrived in safety at Chipewyan Fort on the 12th of September.

After little more than a year of repose at home, or rather a year of active trading, the bold traveller was alert upon a new journey, and one of greater importance than the former, being nothing less than an attempt to reach the Pacific—an adventure which no European in North America had as yet accomplished, or, as far as is known, had even attempted. Again, therefore, he left Fort Chipewyan on the 10th of October, 1792, and proceeded up the Peace River. "I had resolved," he says, "to go as far as our most distant settlement, which would occupy the remaining part of the season, it being the route by which I proposed to attempt my next discovery, across the mountains from the source of that river; for whatever distance I could reach this fall would be a proportionate advancement of my voyage." He set off, accompanied by two canoes laden with the necessary articles of trade, and prosecuted the enterprise partly by water and partly by land. The dangers he underwent were, if possible, still greater than before, not merely from natural obstacles, but the hostility or the blunders of the wild tribes with whom he came in contact; and it is strange, as well as not a little interesting, to read in his narrative, not only of manners that are fast disappearing from the world, but of large Indian communities that have either dwindled into families, or utterly passed away. After nine months of persevering travel his

aim was accomplished, for he had penetrated across the mountains, and through the North American continent, to the shores of the Pacific; and having reached the point of his ambition, he mixed up some vermilion in melted grease, and inscribed upon a rock on which he had passed the night this short memorial: "Alexander Mackenzie, from Canada by land, the twenty-second of July, one thousand seven hundred and ninety-three." It was a necessary precaution, as only the day after, when he was upon his return homeward, he very narrowly escaped assassination from the natives. He arrived at the fort on the 23d of August, 1793, and thus takes leave of his readers: "Here my voyages of discovery terminate. Their toils and their dangers, their solitudes and sufferings, have not been exaggerated in my description. On the contrary, in many instances language has failed me in the attempt to describe them. I received, however, the reward of my labours, for they were crowned with success."

After he had returned to Fort Chipewyan, Mackenzie appears to have devoted himself, for a time at least, to that profitable trade in furs which his enterprises had so greatly tended to enlarge and benefit. He also prepared for the press his narrative, which was published in London in 1801, with the following title: "*Voyages from Montreal, on the River St. Lawrence, through the Continent of North America to the Frozen and Pacific Oceans, in the years 1789 and 1793. With a Preliminary Account of the Rise, Progress, and Present State of the Fur Trade of that Country. Illustrated with Maps, &c.*" The value of his exertions was so justly appreciated, that soon after the publication of this work he received the honour of knighthood. From this period we so completely lose sight of Sir Alexander, that we know neither his after history nor the period of his death; but from a biographical volume of living authors, published in 1816, we ascertain that he was still alive at that date.

MACKENZIE, CHARLES FREDERICK. This amiable prelate and missionary, who combined the accomplishments of a scholar with the religious devotedness of an apostle, was the youngest son of Colin Mackenzie, Esq., of Portmore, Peebleshire, and Elizabeth his wife, daughter of Sir William Forbes, Bart., of Pitsligo, Aberdeenshire. He was born at Marcus Cottage, Peebleshire, on the 10th of April, 1825. In 1834 he was sent to the Edinburgh Academy; and from this, after six years of a classical education, he was removed to Dr. Cowan's, Grange School, near Sunderland. In 1844 he matriculated at St. John's College, Cambridge, where he continued a student during two terms; but being a Scotsman, and therefore not eligible for a fellowship at that college, according to its regulations, he removed to Gonville and Caius College, finding that at Caius there was no such restriction.

It is known to the generality of our readers that the university of Cambridge is famed for its pre-eminence in mathematics, and that the distinguished students in that home of scientific learning are so numerous as greatly to diminish the chances of a successful competition. But Charles Mackenzie soon took the first place in his year in mathematics. And still better than the distinction of such success, and the emulation it was calculated to excite, was the weight of his pure religious and moral character, and the influence of his example; and at this time he is thus described by one of his fellow-students: "Sooner than I could have believed it possible, if I had not seen it, he became known and beloved by every one in college. He surprised us by show-

ing that it was possible to be religious without being morose, and to be zealous for the spiritual welfare of others without fanaticism or party spirit. He at once took the lead in every good work, and at the same time joined energetically in all our amusements. He pulled regularly in our boat, and there soon showed some of the best points of his character, in his cheerfulness under defeat, his calmness in success. He never connived at sin, no bad word or bad deed in his presence failed to produce a protest from him, or more generally a kind and friendly remonstrance from him afterwards in private. I feel sure that there is many an old college friend, and many a one too who could hardly call himself an acquaintance, who could tell you how grateful he still feels for some such word of advice kindly given in season by Mackenzie."

The same amiable simplicity and uprightness, combined with the same intellectual superiority, continued to distinguish him during the rest of his career at college, and in 1848 he graduated as second wrangler. On the occasion of winning this high university distinction, he gave utterance to an expression which for the present excited much mirth, but was long afterwards tenderly and affectionately remembered by many who had joined in the laugh. When the ovation followed which usually welcomes the successful candidates for college distinctions, and when he and the other honour-men of the year were thanked for the credit which their exertions and success had conferred upon their college, Mackenzie replied, that "he did not see that they deserved any thanks, for that they had only done what was natural under the circumstances." Such an unusual reply from the hero of a triumph! But, as his biographer has justly observed, "This was indeed the key to all his subsequent acts of Christian self-devotion, and to the humility and oblivion of self which was so conspicuous throughout his brief but bright career. What others admired as heroic self-denial, appeared to him only 'natural under the circumstances,' and in no way meritorious or out of the common course of things."

Soon after taking his degree Mr. Mackenzie was elected to a fellowship in his college, and was ordained on his fellowship by the Bishop of Ely. After this he resided in the college as lecturer until 1854. This entrance into the work of active life only redoubled his earnestness in doing good, and brought his many excellent qualities into more conspicuous notice; and their effect was such, that no man of the age was supposed to have exercised such a beneficial influence upon the university of Cambridge. Such an example given by a young man—a gentleman, and a highly accomplished scholar—and who, withal, like the apostle of the Gentiles, "made himself all things to all men," that he might allure them to righteousness—had its natural effect upon the characters of his fellow-students; and while they loved the man, and felt him to be one of themselves, they learned to love those principles which had elevated him to his superiority, and strove to be like him. In this manner the "little heaven" diffused its leavening process throughout the whole university. While he resided in the college, and discharged his scholastic duties, he served the curacy of Haslingfield, a village in the neighbourhood of Cambridge, where his ministrations were highly valued by his parishioners. In Cambridge itself he also reorganized and placed the system of voluntary chaplains in the Aldenbrooke Hospital upon a more satisfactory footing—a labour of love for which he is still gratefully remembered in the city. But all this he felt to be not enough while anything more effective, although

more laborious and self-denying, remained to be done; and having heard a sermon preached by the Bishop of New Zealand upon the necessity and duty of missions to the heathen, Mr. Mackenzie resolved to become a missionary. Here however his friends interposed, and by representing to him the field that lay before him in Cambridge, and the success that had hitherto attended his efforts, they prevailed upon him to remain at college. His purpose, however, although postponed, was not abandoned; and in consequence of a sermon preached by Bishop Selwyn, his missionary zeal blazed out afresh, and with greater ardour than before. He now felt that while there were many at Cambridge who could enter his place and fulfil its duties, there were comparatively few who had the power and will to devote themselves to the service of the church in foreign lands. With many the missionary service was thought too humble for the alumnus of a university; with not a few it was an extinction of their clerical ambition and hopes of preferment; with all it was an exile from country and from civilized existence, and exposure to the privations of savage life, with the additional risk of martyrdom. But just because others would not embrace such a life, Mackenzie would adopt it. However scorned or however rejected, the duty was as imperious to convey the gospel to savages and the heathen, as to the rich, the great, and the civilized; and to him that was enough. Accordingly, in the autumn of 1854 he went out to Natal, as Archdeacon of Pieter-Maritzburg under Bishop Colenso, and there remained until 1859. It is worthy of note, that during these five years he supported himself at his own charges, and applied his small stipend to the maintenance of another clergyman in the colony.

Such a position as that of an archdeacon in a newly opened colony, and with few but boors and savages to compose his precarious congregations, would to most men have been enough, especially if they could retreat from the enterprise without the positive loss of honour. The country, the society, and the modes of life were little adapted to one who had lived in college halls with reputation, and to whom the prospect of high preferment in the church at home had been opened; and in 1859 Mr. Mackenzie returned to England. But it was not in disgust at the task he had undertaken, or with the purpose of exchanging it for more congenial work in Britain: on the contrary, this preliminary foretaste of missionary labour had only inspired him with the resolution to go more thorough in the enterprise, and to become wholly and entirely a missionary. His return was therefore for the purpose of offering himself as the conductor of a mission to the Zulu Caffres, a wholly savage population, and that of the rudest kind. It was not the offer of an ignorant enthusiast, but of one who well knew the nature of the task, and had deliberately counted the cost. There were circumstances, however, which for the present had opened up such a tempting field in another quarter as to make a mission to the Zulus inexpedient. Dr. Livingstone had returned from one of his wonderful African explorations; had visited Oxford and Cambridge; and impressed the two universities with a conviction of the advantages of settling a mission somewhere in the centre of Southern Africa, the country he had just explored, and which seemed so favourable for such an attempt. This enterprise appeared so hopeful, that committees were formed in the two universities and in London, for originating this new mission; and the opportune arrival of Archdeacon Mackenzie in England suggested the idea that here was the right man as well as the right

place for him. The three committees unanimously invited him to lead this arduous undertaking, to which the archdeacon cordially assented. This was at the commencement of November, 1859. As funds were necessary before operations could be commenced, Mackenzie during the next eleven months devoted himself to the work of collecting them; and wherever he went during an anxious and laborious tour in England, Scotland, and Ireland, his evangelical devotedness and amiable character recommended his appeals even to the hearts of the most indifferent. All being in readiness for embarkation, Mackenzie performed a solemn and affecting religious public service in the stately and venerable cathedral of Canterbury, and accompanied with a small staff of missionaries, lay and clerical, he set sail upon the great work of evangelizing Central Africa on the 6th of October, 1860. Still young in years, it was anticipated that a lengthened career would be granted him; and from such earnest self-sacrifice, talents, and apostolic piety, how fair was the prospect of success to such a mission! Little did his numerous friends and well-wishers know that a grave already awaited him in Africa, and that his death and example were to encourage those followers whom his life could not aid.

Having arrived at Capetown on the 12th of November, Mackenzie was consecrated bishop on January 1, 1861, the feast of the Circumcision, by the metropolitan of Capetown, assisted by his two suffragans, the Bishops of St. Helena and Natal. Having no defined territory for his diocese, the title of the new prelate was "Bishop of the Mission to the Tribes dwelling in the Neighbourhood of the Lake Nyassa and River Shiré." On January 12, 1861, he sailed for the Zambesi, and arrived off Kongone on February 7, where he joined company with Dr. Livingstone, whose advice and direction were necessary in establishing the proper site of the mission. To settle this important matter a careful examination had to be made, and the next six weeks were spent in company with Dr. Livingstone in a minute exploration of the river Roovooma, in the hope that it might lead to some opening into the interior of the country, by which the toil and danger of a land journey might be saved. But no such opening being found, the mission on the 1st of May crossed the bar of the Kongone mouth of the Zambesi, and on the 8th of July they arrived at Dakanamoyé, a village on the river Shiré, about 200 miles above the confluence of that river and the Zambesi. Still following Dr. Livingstone as their leader, the missionaries were conducted by him about sixty miles into the interior of the country, to the heart of the Manganja highlands, where he settled them at a village named Magomera, and leaving to their charge a party of natives whom he had rescued from slaves, who might form a nucleus of their mission. And now Bishop Mackenzie had found a resting-place in his pilgrimage—but it was only that he might die in peace. All was fair and promising, and he had commenced his beloved missionary work with his wonted earnestness, when it was brought to a sudden close by his untimely death on the island of Mulo, at the confluence of the Ruvo and Shiré, on January 31, 1862, when he was only thirty-five years of age.

MACKENZIE, GEORGE, first Earl of Cromarty, a distinguished political and literary character, was born in the year 1630, being the eldest son of Sir John Mackenzie of Tarbat, by Margaret, daughter of Sir George Erskine of Innerteil, one of the senators of the College of Justice. He succeeded his father in 1654, and acted a conspicuous part in the

irregular warfare carried on at that period by General Middleton against the forces of Cromwell. After the Restoration, when Middleton received an earldom, and was appointed to the direction of Scottish affairs, Sir George Mackenzie became his principal confidant, and had a prominent share in the transactions connected with the celebrated *billeting act*, which ended in the common disgrace of the earl and Sir George. The latter consequently remained unemployed throughout the whole administration of the Duke of Lauderdale. He afterwards obtained that promotion to which his extraordinary talents entitled him. In 1678 he was appointed justice-general for Scotland, and in 1681 a lord of session, and lord-register. In 1685 James II. created him Viscount of Tarbat, by which name he is best known. Though an active and unscrupulous agent of the two last Stuarts, he had no objection to continue in employment under the system of things established at the Revolution. But King William, to whom he lost no time in paying his respects, did not think proper to employ him till 1692, when his lordship was restored to his office of lord-register.

Here the evil habits he had contracted under the late government appear to have still clung to him. The spirit which induced Charles II. to say, that, though Lauderdale was complained of by the *people*, he did not seem to have done anything contrary to the interests of the *sovereign*, was what animated this veteran instrument of arbitrary authority. Having been accused of falsifying the minutes of parliament for private objects, he does not appear to have paid the least regard to the truth or falsity of the charge: in his defence, addressed to Mr. Carstairs, he dwells only on the malice which animated his accusers, and on the constancy of his own attachment to the king. He found it necessary, however, to retire upon a pension of £400 a year. In a subsequent letter he is found petitioning for a remission, and in such terms as give a curious idea of the state of moral feeling among politicians in that age:—"I wish," says he, "to have a very general remission sent me, because I see faults fish't in by others upon as great grounds. If it comes, let it contain *treason, perduellion, and a general of all crimes*; though, on all that's sacred, I know not myself guilty, nor do I fear anything on this side Irish witnesses or evidence." At the accession of Queen Anne this able statesman was made secretary of state for Scotland; an office which he resigned in 1704 for that of justice-general. In 1703 he was elevated to the dignity of Earl of Cromarty. Having resigned the justice-generalship in 1710, he retired some years after to his seat of New Tarbat, in Ross-shire, intending, without any apparent regard to his advanced age, to live there in an economical manner for six years, in order that he might be subsequently enabled to reside in London. The design was almost at the very outset interrupted by death; his lordship expiring, August 17, 1714. He has an elegant obelisk erected to his memory in the neighbourhood of Dingwall.

The Earl of Cromarty, notwithstanding the faults already alluded to, is acknowledged to have been a good-natured man, "possessed of a great measure of polite learning and good parts, and master of an extraordinary gift of pleasing and diverting conversation, which rendered him one of the most entertaining companions in the world. He was one of the original fellows of the Royal Society, and reckoned among the ablest members of that learned body; in the *Philosophical Transactions* many papers of his lordship may be seen. His other publications, arranged in chronological order, are:—1. *A Vindication of King Robert III. from the Imputation of Bastardy*, Edin.

1695, 4to.—2. *The Mistaken Advantage of Raising of Money*, Edin. 1695, 4to.—3. *Letter to the Earl of Wemyss concerning the Union with England*, 1706, 4to.—4. "Friendly Response to a Letter concerning Sir George Mackenzie's and Sir John Nisbet's Observations and Response on the Matter of the Union," 1706, 4to.—5. "*Synopsis Apocalypticæ*; or a Short and Plain Explication of Daniel's Prophecy, and of St. John's Revelation in Concert with it," 1707, 4to.—6. "Historical Account of the Conspiracy of the Earl of Gowrie and of Robert Logan of Restalrig against King James VI.," 1713, 8vo.—7. "A Vindication of the same from the Mistakes of Mr. John Anderson, Preacher of Dumbarton, in his Defence of Presbytery," 1714, 8vo.

MACKENZIE, SIR GEORGE, a celebrated lawyer and state officer, and perhaps the first Scotsman who wrote the English language in a style approaching to purity, was born at Dundee, in 1636. His father was Simon Mackenzie of Lochslin, brother of the Earl of Seaforth, and his mother Elizabeth Bruce, daughter of Dr. Peter Bruce, principal of St. Leonard's College, St. Andrews. His progress at school was so rapid, that in his tenth year he was master of all the classical authors usually taught in schools. He afterwards studied Greek and philosophy in the universities of St. Andrews and Aberdeen, and civil law in that of Bourges in France; and, in January, 1659, before the termination of his twenty-third year, entered as an advocate at the Scottish bar.

In 1660 he published his "*Arctina*, or Serious Romance," in which, according to his kind biographer, Ruddiman, he gives "a very bright specimen of his gay and exuberant genius." His talents must have been early observed and appreciated, for in 1661, his third year at the bar, he was selected as one of the counsel of the Marquis of Argyle, then tried by a commission of parliament for high-treason. On this occasion he acted with so much firmness, and even boldness, as at once established his character. As the counsel for Argyle were appointed by parliament, they presented a petition under form of protest, that in the defence of their client they might not be made responsible for every expression they might utter, but that a latitude and freedom of expression, suitable to the extent and difficulty of the charges they were called upon to canvass, might be allowed them. This being peremptorily refused, Sir George and his associates took such steps, in consequence, as subjected them to the imminent risk of a charge of treason: "it is impossible to plead for a traitor," said the young lawyer, "without speaking treason!" an antithesis certainly more bold than true, but calculated to make a considerable impression upon the multitude. The counsel only escaped from the consequences of their rashness by the special mercy of the court.

The purely literary labours of this eminent person appear to have been chiefly executed during his earlier years. His "*Religio Stoici*," or a short Discourse upon Several Divine and Moral Subjects," appeared in 1663. Two years afterwards he published his *Moral Essay upon Solitude*, preferring it to public employment, with all its appendages, such as fame, command, riches, pleasures, conversation, &c. This production was answered by the celebrated Evelyn, in a *Panegyric on Active Life*. "It seems singular," says the *Edinburgh Review*, "that Mackenzie, plunged in the hardest labours of ambition, should be the advocate of retirement, and that Evelyn, comparatively a recluse, should have commended that mode of life which he did not choose."¹ But it

is probable that each could write most freshly on circumstances disconnected with the daily events of his life, while speculative ingenuity was all they cared to reach in their arguments. "You had reason to be astonished," says Evelyn, writing to Cowley, "that I, who had so much celebrated recess, should become an advocate for the enemy. I conjure you to believe that I am still of the same mind, and there is no person who can do more honour, and breathe more after the life and repose you so happily cultivate and advance by your example; but as those who praised dirt, a flea, or the gout, so have I public employment, and that in so weak a style compared with my antagonists, as by that alone it would appear that I neither was nor could be serious." In 1667 Mackenzie published his *Moral Gallantry*, one of the reflective treatises of the period, intending to prove the gentlemanliness of virtue, and the possibility of establishing all moral duties on principles of honour—a theory supported by arguments which, had any of the nicer metaphysical minds of the succeeding age thought fit to drive to their ultimate principles, they might have found to be somewhat inimical to the author's hearty Church of England feelings, or even the principles of Christianity. But Mr. Mackenzie was not a metaphysician, and religion required to be plainly spoken in terms of Presbyterianism or Papistry, before it attracted his legal attention. To this production he added a *Consolation against Calumnies*. The fiery course of politics which he had afterwards to run, made a hiatus of considerable extent in the elegant literary pursuits of Mackenzie; but after his retirement from public life he wrote another work which may be classified with those just mentioned—*The Moral History of Frugality*; nor in this classification must we omit his *Essay on Reason*. Mackenzie had associated himself with the elegant wits of England, and his opportunities enabled him, if he was inferior in the actual bullion of genius to many of his countrymen who had gone before him, to give it a more elegant, or at least fashionable form. It is probable that any direct imitation, on the part of Mackenzie, may have been from the writings of Cowley, who, in the youth of the ambitious Scottish author, was the acknowledged leader of refinement in English composition. From his opponent Evelyn he may also have derived facilities in composition; but it is probable that the best tone he assumed was imparted by the colloquial influence of Dryden. Of Mackenzie that great man has left an interesting memorial:—"Had I time, I could enlarge on the beautiful turns of words and thoughts, which are as requisite in this as in heroic poetry itself. With these beautiful turns I confess myself to have been unacquainted till about twenty years ago, in a conversation which I had with that noble wit of Scotland, Sir George Mackenzie. He asked me why I did not imitate, in my verse, the turns of Mr. Waller and Sir John Denham, of whom he repeated many to me. I had often read with pleasure, and with some profit, these two fathers of our English poetry, but had not seriously enough considered their beauties, which give the last perfection to their works. Some sprinkling of this sort I had also formerly in my plays, but they were casual and not designed. But this hint, thus seasonably given me, first made me sensible of my own wants, and brought me afterwards to seek for the supply of them in other English authors." This is given by Dryden in his *Discourse on the Origin and Progress of Satire*, prefixed to his Juvenal, published two years after Mackenzie's death. Mackenzie is characterized by the *Edinburgh Review* as having been in his style not exempt from Scotticisms: "but he is perfectly

free from those, perhaps, more disagreeable vices, into which more celebrated Scottish writers have been betrayed by a constant fear of Scotticism. He composes easily and freely, and his style is that of a man who writes his native language." Meanwhile, along with his elegant prose, he found time and inclination to dabble in poetry. Sometime during his early years at the bar, he wrote *Celias' Country House and Closet*, a poem in English epics, and written in a manner more nearly akin to the style of Pope and his contemporaries, than that which flourished in the author's own time. Such a passage as the following will enable the reader to comprehend at once the merit of the work, and, taking into consideration the political life of the author, its artificial feeling:—

"O happy country life, pure as its air;
Free from the rage of pride, the pangs of care;
Here happy souls lie bathed in soft content,
And are at once secure and innocent.
No passion here but love: here is no wound,
But that by which lovers their names confound
On barks of trees, whilst with a smiling face
They see those letters as themselves embrace."

Country life, and love in the midst of it, were standing characteristics of the fashionable poetry of the period, and the stormy politician, anxious, like Richelieu, to distinguish himself in song, must submit to them as absolutely as the love-sick swain, to whom they are a natural habit. The author seems to have been apprehensive that the fruit of his more elegant studies would not give the world a favourable opinion of his professional attainments. "The multitude," he says in the conclusion to his *Religious Stoic* "(which, albeit, it hath ever been allowed many heads, yet hath never been allowed any brains), will doubtless accuse my studies of adultery, for hugging contemplations so eccentric to my employment. To these my return is, that these papers are but the parings of my other studies, and because they were but parings I have flung them out into the streets. I wrote them in my retirements, when I wanted both books and employment; and I resolve that this shall be the last inroad I shall ever make into foreign contemplations."

Let us now turn from his literature to the political and professional advancement which interfered with its progress, or at least changed its course. Soon after the Restoration he was appointed a justice-depute, or assistant to the justiciar or chief-justice; a situation, the duties of which were almost equivalent to that of an English puisne judge of the present day, in criminal matters. He must have received the appointment very early in life, as in 1661 he and his colleagues were appointed to repair "once in the week at least to Musselburgh and Dalkeith, and to try and judge such persons as are ther or therabout delated of witchcraft;" and the experience in the dark sciences obtained by him in this occupation, provided him with much grave and learned matter for his work on the criminal law of Scotland. Within a few years after this period (the time is not particularly ascertained) he was knighted. In 1669 he represented the county of Ross, where the influence of his family was extensive, in parliament. During that year the letter of Charles, proposing the immediate consideration of a plan for an incorporating union of the two kingdoms, was read in parliament. Sir George, an enemy to everything which struck at the individual consequence and hereditary greatness of the country in which he held a stake, opposed the proposition. He tells us, in his amusing memoirs of the period, that when the commissioner proposed an answer, closing with the king's proposals, and entitling him to the election of the commissioner, he

moved that the parliament should have a day for the consideration of so serious a matter, as there might be questions about succession to be discussed, "whereupon the commissioner rose in a great passion, and told that he consented that the parliament should deliberate upon the letter now read till to-morrow; but that he understood not how any member of parliament could be so bold as to inquire into the succession, upon a supposition that his majesty, and all the present royal line, should fail." Next day Sir George came prepared with a speech on the subject. Of this somewhat interesting effort he has given us a transcript, which is generally understood to be the earliest authentically reported specimen of legislative eloquence in Scotland. It is compact, clear, accurate, well composed, without flights of ardour, and therefore destitute of the burning impetuosity which afterwards distinguished Fletcher and Belhaven. On the whole, it appears, in its present form at least, to have been composed in the closet. His reasoning, when the aim is considered, was prudent and cautious—he considered and doubted "whether it was suitable to our honour to advance in this union three steps before England met us in one: and that we have done so in this letter appears from this, that to treat of a union is one step; the second is to name commissioners; the third is to appoint their quorum, time, and place of their meeting: all which are several steps, because they behoved, if they had been concluded in parliament, to have had several votes and conclusions." He also doubted "whether it were fitter for his majesty's service, and the intended treaty, that the nomination of the commissioners should be referred to his majesty, or rather that they should be nominated in parliament." His speech gave great offence to those who had peculiar grounds for objecting to long harangues. "About the close of his discourse he was interrupted by the Earl of Tweeddale, who said, that such long discourses were intolerable, especially where they intended to persuade the parliament not to comply with his majesty's desires—which interruption was generally looked upon as a breach of privilege—and it was desired by Duke Hamilton, that the Earl of Tweeddale should go to the bar; but the gentleman who was interrupted declared that he had not been interrupted, but had finished his discourse; and, thereupon, that motion took no further effect."

Sir George sought distinction in his course through parliament by popular measures. In 1669 an act had been passed compelling merchants to make oath as to their having paid duties on their merchandise. "The commissioner had that day said that the stealing of the king's customs was a crime, which was to be provided against; whereupon Sir George Mackenzie replied, that if it was a crime, no man could be forced to swear for it; for by no law under heaven was it ever ordained that a man should swear in what was criminal. This, and all other passages of that day, joined with Sir George owning the burghs, in which it was alleged he had no proper interest, made his grace swear, in his return from the parliament, that he would have that factious young man removed from the parliament; to effectuate which, he called a council of his favourites, and it was there contrived that his election should be quarrelled, because he held only lands of the Bishop of Ross, but not of his majesty, and so was not a free baron. But they were at last diverted from this resolution by the register, who assured them that this would make the people jealous of some close design to overturn their liberties, which, as they believed, that gentleman defended upon all occasions; and that he would glory in his exclusion, because it

would be believed that they could not effectuate their intentions if he were allowed to keep his place in parliament." Such is his own account of his parliamentary conduct—it may be correct in point of fact, and he has abstained from any mention of the motives. He opposed the act of forfeiture against the western rebels, insisting that no man ought to be found or proved guilty in absence. His account of the opposition of the advocates on the subject of appeals, along with his somewhat suspicious conduct towards his rival Lockhart, have been already detailed.¹ Sir George Mackenzie would have gone to the grave with the character of a patriot, had he not been placed in a position where serving a king was more beneficial than serving the people. On the 23d of August, 1677, he was named king's advocate on the dismissal of Sir John Nisbet. The object of the change was a subject of deep and well-founded suspicion. Sir George states that his precursor, "a person of deep and universal learning, having disobliterated my Lord Hatton, he procured a letter to the lords of session, ordaining them to make inquiry into his having consulted *pro et con.* in the case of the lord-chancellor and Lord Melville, concerning the tailzie of the estate of Leven," and Sir George amiably represents himself as having persuaded Nisbet to stand to his defence. Wodrow observes that he was appointed, "some say upon a very sordid reason;" and Burnet distinctly states that it was for the purpose of prosecuting Mitchell, who had been pardoned four years before for the attempted murder of Sharpe: at all events this was his first duty in his high office—it was one which on the whole required some address. Mackenzie had prepared himself by having been counsel for Mitchell when he was previously tried. "He was a very great instrument," says Wodrow, "in the hands of the Presbyterians, and was scarce ever guilty of moderating any harsh proceedings against them, in the eyes of the prelates themselves."

As the trial of the Earl of Argyre in 1661 was the first important political case in which Sir George had tried his powers as a defender, so was that of his son, in 1681, the first which exercised his abilities as a state prosecutor. In the father's case he had to resist the oppressive fictions of the crown lawyers, but all he suffered was amply repaid on the son. After this celebrated trial he appears to have obtained, as part of the spoil, a gift of the barony of Bute, ratified by the parliament of 1681.² On the recapture of the earl after his escape, Mackenzie was one of those who objected to a new trial, and he accordingly recommended his suffering on his former sentence; he is alleged to have done so from the probability that, owing to the extreme injustice of the sentence, his heirs might probably be restored to their heritage. If such was indeed his motive, no man was ever more improvident of his own fame, or disinterested in sacrificing it for others; but Mr. Laing has shrewdly observed, "No doubt Sir George at the Revolution would assume that merit with Argyre's son, when they sat together in the convention parliament. But he was the man who procured, when king's advocate, that illegal sentence on which he moved for Argyre's execution."³ Meanwhile his professional ingenuity had been employed in the case of the lawburrows, by which a legal form, useful in the defence of the subject against lawless aggression, was, by adding to its natural power the weight of the royal influence, made an engine of oppression. It would be a vain task to enumerate the minor state

¹ In the life of SIR GEORGE LOCKHART.

³ *History*, ii. 154.

prosecutions which in this eventful period gave full employment to this active servant of government—most of them are well known, and they were at any rate numerous enough to stamp him in the minds of his opponents with a character which must live with his name—"The blood-thirsty advocate." In the year 1680 he tried the celebrated Cargill, who, among other acts of inefficacious spiritual authority, had pronounced sentence of excommunication on the lord-advocate. When the indictment was read, bearing, in the ordinary terms, that the accused "having cast off all fear of God," &c., the clerk was interrupted by Cargill, who said, "The man who hath caused this paper to be drawn up hath done it contrary to the light of his own conscience, for he knoweth that I have been a fearer of God from my infancy; but that man, I say, who took the holy Bible in his hand, and said it would never be well with the land till that book was destroyed, I say, *he* is the man who hath cast off all fear of God." In 1684, after the escape of Sir Hugh Campbell, it being felt necessary that Baillie of Jerviswood should suffer, Mackenzie's energies were exercised on the occasion; and he gained the gratitude of the court by doing what was wanted. Fountainhall has a characteristic note about his proceedings at this period. "Sir William Scott of Harden, fined in 1500 lb. sterling for his ladie's being at a conventicle, and being at one himself. It was said the king's advocate, Sir George Mackenzie, got a previous gift of this fine for journeys to London."¹ Sir George found it necessary to attempt a vindication of his acts, under the title of *A Vindication of the Government of Charles II.*, which, Lord Woodhouselee calmly observes, "will fully justify his conduct in the breast of every man whose judgment is not perverted by the same prejudices, hostile to all government, which led those infatuated offenders to the doom they merited."² Sir George was a calm and thinking man, and his vindication bears the aspect of candour; but it is deficient in conclusiveness. "No age," he says, "did see so many thousands pardoned, nor so many indemnities granted as was in his time: which, as it must be principally ascribed to the extraordinary clemency of the kings he served, so it may be in some measure imputed to the bias which Sir George had to the merciful hand." Sir George leaves out of view that it is possible for one lord-advocate so far to exceed another in the number of his prosecutions as both to acquit and sacrifice more than the whole number accused by his brethren. It was not those who were forgiven, but those who were not forgiven, that fix upon the reign of Charles II., and also upon his Scottish advocate, the indelible character of oppression and bloodthirstiness. It must at the same time be allowed that the acute mind of Sir George Mackenzie was never asleep to practical improvements in jurisprudence, although the lust of power was sufficient to subdue his efforts, or turn them into another course. While he wielded the sword of persecution himself, he did much to unfit it for the use of others. He countenanced and cherished a principle, which called for the examination of all witnesses in criminal cases in presence of the accused, instead of the secret chamber of the privy-council. A frightful fiction of the law of both countries, by which no evidence could be led by a prisoner in opposition to the assertions of the libel made by the prosecutor, as representing the king, was removed by Sir George forty years before it ceased to exist in England; and he put a stop to the system of permitting the clerk of court to be inclosed with the

king for the purpose of assisting him. This was done with a view to preserve the independence of jurymen; but let it be remarked, that in his work on criminal law he advises the total abolition of trial by jury.

In 1686 Mackenzie showed that he had a feeling of conscience, and that his religion, if entirely political, was not accurately squared to personal aggrandizement, by suffering himself to be dismissed for not agreeing to the Catholic projects of James II. In 1688, however, he was restored, on the advancement of his successor Dalrymple to the presidency of the Court of Session.³ The Revolution terminated his political career. At this feverish moment of struggle and disappointment he could so far abstract his mind from politics as to perform the greatest public service which is even now connected with his name, by founding the Advocates' Library. The inaugural speech which was pronounced on the occasion is preserved in his works. The institution has flourished, and redeems Scotland from the imputation of not possessing an extensive public library. After the Revolution Sir George threw himself into the arms of the university of Oxford, the fittest receptacle for so excellent a vindicator of the old laws of divine right. He was admitted a student on the 2d of June, 1690; but he did not long live to feel the blessings of the retirement he had praised, and for the first time experienced. He died at St. James's on the 2d May, 1691. He was still remembered in the national feeling as a great man, and his funeral was one of unusual pomp. He lay several days in state in the abbey of Holyrood House, whence his body was conveyed to the Grayfriars' Churchyard, attended by a procession, consisting of the council, the nobility, the College of Justice, the College of Physicians, the university, the clergy, and many others.

Sir George wrote several works of a more laborious cast than those to which we have referred. His *Institute of the Law of Scotland* is well arranged, but, in comparison with the profoundness of Dalrymple, is meagre, and its brevity makes it of little use. His *Laws and Customs in Matters Criminal* is full of useful information, and is the earliest arrangement (though not a very clear one) of our criminal code. His *Observations on the Laws and Customs of Nations as to Precedency, with the Science of Heraldry as Part of the Law of Nations*, is esteemed by heralds. When Stillingfleet and Lloyd made their critical attacks on the fabulous history of Scotland, Sir George, who seemed to consider it a very serious matter to deprive his majesty of forty ancestors, wrote in 1680 *A Defence of the Royal Line of Scotland*, in which he comes forward as his majesty's advocate, and distinctly hints to the contemners of the royal line, that, had they written in Scotland, he might have had occasion to put his authority in force against them. These works, along with the observations on the acts of parliament, and some other minor productions, were edited by Ruddiman, in two handsome folio volumes, in 1722. His *Memoirs*, or account of his own times, certainly the most interesting of all his works, though promised at that time, was withheld through the timidity of his friends. When long lost sight of, the greater part of it has of late years been recovered to the world. It is full of graphic pictures of the state of the times; and, if not so descriptive in character as Clarendon or Burnet, is often more lively in the detail of incident, and more acute in perceiving the selfish motives of the actors.

MACKENZIE, HENRY, one of the most illustrious names connected with polite literature in Scotland. He was born at Edinburgh in August, 1745, while the citizens were preparing, by ineffectual fortifications, for the dreaded attack of Prince Charles Stuart, then collecting his army in the Highlands.¹ The nativity of Mr. Mackenzie was fixed by himself at a public meeting which he attended late in life upon the venerable alley denominated *Liberton's Wynd*, now removed in order to admit of a bridge for the connection of the High Street with the southern districts of the city. His father was Dr. Joshua, or (as his name is spelled in the *Scots Magazine* for 1800, where his death is recorded), Josiah Mackenzie, an eminent physician. Dr. Mackenzie was, we believe, a native of Fortrose, upon the Moray Frith, but had removed in early life to Edinburgh, where he acquired an extensive practice as a physician, and distinguished himself in the world of letters as author of a volume of *Medical and Literary Essays*.² The mother of the author of the *Man of Feeling* was Margaret, eldest daughter of Mr. Rose of Kilravock, a gentleman of ancient family in Nairnshire.

After being educated at the high-school and university of Edinburgh, Mr. Mackenzie, by the advice of some friends of his father, was articled to Mr. Inglis of Redhall, in order to acquire a knowledge of the business of the exchequer, a law department in which he was likely to have fewer competitors than in any other in Scotland. To this, though not perfectly compatible with the literary taste which he very early displayed, he applied with due diligence; and in 1765 went to London to study the modes of English exchequer practice, which, as well as the constitution of the court, were similar in both countries. While there, his talents induced a friend to solicit his remaining in London, and qualifying himself for the English bar. But the anxious wishes of his family that he should reside with them, and the moderation of an unambitious mind, decided his return to Edinburgh; where he became, first partner, and afterwards successor, to Mr. Inglis, in the office of attorney for the crown.

His professional labour, however, did not prevent his attachment to literary pursuits. When in London he sketched some part of his first and very popular work *The Man of Feeling*, which was published in 1771, without his name, and was so much a favourite with the public, as to become, a few years after, the occasion of a remarkable fraud. A Mr. Eccles of Bath, observing the continued mystery as to the author, laid claim to the work as his own, and, in order to support his pretensions, transcribed the whole with his own hand, with an appropriate allowance of blottings, interlineations, and corrections.

So plausibly was this claim put forward, and so pertinaciously was it adhered to, that Messrs. Cadell and Strachan, the publishers, found it necessary to undeceive the public by a formal contradiction.

Though Mr. Mackenzie preserved the anonymity of the *Man of Feeling* for some years (probably from prudential motives with reference to his business), he did not scruple to indulge, both before and after this period, in the literary society with which the Scottish capital abounded. He informs us in his *Life of Home* that he was admitted in boyhood as a kind of page to the tea-drinkings which then constituted the principal festive entertainment of the more polished people in Edinburgh: and his early acquaintance with Hume, Smith, Robertson, Blair, and the rest of the literary galaxy then in the ascendant, is evidenced from the same source. He was an early intimate of the ingenious blind poet Dr. Blacklock; and at the house of that gentleman, as we have been informed by a survivor of the party, then a youthful boarder in the house, met Dr. Johnson and Boswell when the former was passing through Edinburgh on his journey to the Hebrides. To quote the words of our informant—"Several strangers had been invited on the occasion (it was to breakfast); and, amongst others, Dr. Mackenzie, and his son the late Mr. Henry Mackenzie. These gentlemen went away before Dr. Johnson; and Mrs. Blacklock took the opportunity of pronouncing a panegyric upon the father and son, which she concluded by saying, that though Dr. Mackenzie had a large family, and was married to a lady who was his son's step-mother, nevertheless the son lived with his own wife and family in the same house,³ and the greatest harmony obtained among all the parties. On this Dr. Johnson said, 'That's wrong, madam;' and stated a reason, which it were as well to leave unchronicled. This settled Mrs. Blacklock's opinion of the doctor. Several years ago, on calling to remembrance the particulars of this breakfast with Mr. Henry Mackenzie, he said there was another reason for Mrs. Blacklock's dislike: she had filled no less than twenty-two cups of tea to Dr. Johnson at this breakfast; which, I told Mr. M., was too many, for Mrs. Blacklock had appointed me to number them, and I made them only *nineteen*!"⁴

Some years after the publication of the *Man of Feeling*, Mr. Mackenzie published his *Man of the World*, which was intended as a counterpart to the other. In his former fiction he imagined a hero constantly obedient to every emotion of his moral sense. In the *Man of the World* he exhibited, on the contrary, a person rushing headlong into misery and ruin, and spreading misery all around him, by pursuing a happiness which he expected to obtain in de-

¹ Sir Walter Scott, in the memoir of Mr. Mackenzie prefixed to his novels in Ballantyne's *Novelist's Library*, states that his birth took place "on the same day on which Prince Charles landed." This, however, is incompatible with the fact of Mr. M. having been born in August, as the prince landed on the 25th of July. We may here also mention that the original source of the memoir itself was not, as implied by Sir Walter, a Paris edition of the *Man of Feeling*, but a publication entitled *The British Gallery of Contemporary Portraits*.

² "We have heard that some of Harley's feelings were taken from those of the author himself, when, at his first entrance on the dry and barbarous study of municipal law, he was looking back, like Blackstone, on the land of the Muses, which he was condemned to leave behind him. It has also been said, that the fine sketch of Miss Walton was taken from the heiress of a family of distinction, who ranked at that time high in the Scottish fashionable world. But such surmises are little worth the tracing; for we believe no original character was ever composed by any author, without the idea having been previously suggested by something which he had observed in nature."—Sir Walter Scott, in Ballantyne's *Novelist's Library*.

³ Their residence was in one of the floors of a tall house at the junction of the Cowgate and Grassmarket, either above or below a floor occupied by Mrs. Syme, the maternal grandmother of Lord Brougham.

⁴ Our correspondent's introduction to this anecdote may be deemed worthy of the reader's notice. "I was twice in company with Dr. Johnson, when he came to Edinburgh, on his journey to the Hebrides. Being then a boarder in Dr. Blacklock's, my request to be present at the breakfast given to Dr. Johnson was readily granted. The impression which I then received of him can never be effaced; but it was not of an unpleasant nature. He did not appear to me to be that savage which some of my college companions had described him: on the contrary, there was much sauvage and kindness in his manner and address to Dr. Blacklock. The blind poet generally stood in company, rocking from one side to another; he had remarkably small white hands, which Dr. Johnson held in his great paws during the most part of the time they conversed together, caressing and stroking them, as he might have done those of a pretty child." It is necessary to mention that the great moralist was, by Boswell's showing, in one of his gentlest moods on this occasion.

fiance of the moral sense. His next production was *Julia de Roubigné*, a novel in a series of letters, designed, in its turn, as a counterpart to the *Man of the World*. "A friend of the author," says Sir Walter Scott, "the celebrated Lord Kames, we believe, had represented to Mr. Mackenzie in how many poems, plays, and novels, the distress of the piece is made to turn upon the designing villany of some one of the *dramatis personæ*. On considering his observations, the author undertook, as a task fit for his genius, the composition of a story, in which the characters should be all naturally virtuous, and where the calamities of the catastrophe should arise, as frequently happens in actual life, not out of schemes of premeditated villany, but from the excess and over-indulgence of passions and feelings in themselves blameless, nay, praiseworthy, but which, encouraged to a morbid excess, and coming into fatal and fortuitous concurrence with each other, lead to the most disastrous consequences. Mr. Mackenzie executed his purpose; and as the plan fell in most happily with the views of a writer whose object was less to describe external objects than to read a lesson to the human heart, he has produced one of the most heart-wringing histories which has ever been written. The very circumstances which palliate the errors of the sufferers, in whose distress we interest ourselves, point out to the reader that there is neither hope, remedy, nor revenge."

In 1777 or 1778 a number of young men of literary taste, chiefly connected with the Scottish bar, formed themselves into an association for the prosecution of their favourite studies, which came to bear the name of the Mirror Club. An account of this fraternity, of its members, and of the way in which they conducted their meetings, has already been given under the article WILLIAM CRAIG, being derived from the oral information of Sir William Macleod Bannatyne, the latest survivor of the society.¹ Of the Mirror Club Mr. Mackenzie was readily acknowledged chief; and accordingly, when it was resolved to issue their literary essays in a small weekly paper, resembling the *Spectator*, he was appointed to undertake the duties connected with the publication. The *Mirror* was commenced on the 23d of January, 1779, in the shape of a small folio sheet, price three halfpence, and terminated on the 27th of May, 1780, having latterly been issued twice a week. Of the one hundred and ten papers to which the *Mirror* extended, forty-two were contributed by Mr. Mackenzie, including "La Roche," and several others of the

most admired of his minor pieces. The sale during the progress of the publication never exceeded 400 copies; but this was more than sufficient to bring it under the notice of a wide and influential circle, and to found the reputation it has since enjoyed. When re-published in duodecimo volumes, a considerable sum was realized from the copyright, out of which the proprietors presented £100 to the Orphan Hospital, and treated themselves to a hogshead of claret, to be drunk at their ensuing meetings.

The *Lounger*, a work of exactly the same character, was commenced by the same writers, and under the same editorship, February 6, 1785, and continued once a week till the 6th of January, 1787; out of the hundred and one papers to which it extended, fifty-seven are the production of Mackenzie. One of the latter papers the editor devoted to a generous and adventurous critique on the poems of Burns, which were just then published, and had not yet been approved by the public voice. As might have been expected, Mackenzie dwells most fondly on the Addresses to the Mouse and the Mountain Daisy, which struck a tone nearest to that prevailing in his own mind.

On the institution of the Royal Society of Edinburgh, Mr. Mackenzie became one of the members; and amongst the papers with which he enriched its *Transactions* are an elegant tribute to the memory of his friend Lord Abercromby, and a memoir on German tragedy; the latter of which bestows high praise on the *Emilia Galotti* of Lessing and on the *Robbers* by Schiller. For this memoir he had procured the materials through the medium of a French work; but desiring afterwards to enjoy the native beauties of German poetry, he took lessons in German from a Dr. Okely, who was at that time studying medicine in Edinburgh. The fruits of his attention to German literature appeared further in the year 1791, in a small volume, containing translations of the *Set of Horses* by Lessing, and of two or three other dramatic pieces. But the most remarkable result of his studies in this department was certainly the effect which his memoir produced on the mind of Sir Walter Scott, then a very young man. It gave a direction to the genius of this illustrious person, at a time when it was groping about for something on which to employ itself; and, harmonizing with the native legendary lore with which he was already replete, decided perhaps that Scott was to strike out a new path for himself, instead of following tamely on in the already beaten walks of literature.

Mr. Mackenzie was also an original member of the Highland Society; and by him were published the volumes of their *Transactions*, to which he prefixed an account of the institution and the principal proceedings of the society. In these *Transactions* is also to be found his view of the controversy respecting Ossian's poems and an interesting account of Gaelic poetry.

Among Mackenzie's compositions are several political pamphlets—all upon the Tory side; the first being *An Account of the Proceedings of the Parliament of 1784*, in which he strongly defended the views of his friend Mr. Henry Dundas, afterwards Viscount Melville. At the time of the French revolution he wrote various tracts, with the design of counteracting the progress of liberal principles in his own country. These services, with the friendship of Lord Melville and Mr. George Rose, obtained for him in 1804 the lucrative office of comptroller of taxes for Scotland, which he held till his death.

In 1793 Mr. Mackenzie wrote the life of Dr. Blacklock, prefixed to a quarto edition of the blind poet's works, which was published for the benefit of

¹ Sir William Macleod Bannatyne was born January 26, 1743 o.s., and died November 30, 1833, in his ninety-first year. He was the son of Mr. Roderick Macleod, W. S., whose sister, Lady Clanranald, for protecting Prince Charles in his wanderings, was made prisoner, and kept for some time in confinement in London. The "young Clanranald," who led out his clan in 1745, and took the town of Dundee, was therefore cousin-german to Sir William. The venerable subject of this note passed advocate January 22, 1765, and was the intimate friend of the first Lord Melville when at the bar, and of several other eminent persons in that profession, with whom he used to meet regularly for mutual improvement in forensic and legal business. His contributions to the *Mirror* were five papers, which are pointed out in the latest edition. On the resignation of Lord Swinton in 1799 he was raised to the bench, where he performed the duties of a judge till 1823. On his retirement he received the honour of knighthood. The remainder of his life was spent by Sir William in a cheerful and hospitable leisure at his residence in Whiteford House, near the bottom of the Canongate, where he was for many years the only surviving specimen of the old town gentleman. Sir William was full of anecdote and information respecting the political history of Scotland during the last century, and showed, in conversation with the present writer, as intimate an acquaintance and as lively a recollection of the secrets of the Walpole and Bute administrations, as could be displayed by any living man respecting that of Mr. Canning or the Duke of Wellington.

his widow. Mr. Mackenzie's intimacy with Blacklock gave him an opportunity of knowing the habits of his life, the bent of his mind, and the feelings peculiar to the privation of sight under which Blacklock laboured. In 1812 he read to the Royal Society his *Life of John Home*, which was some years after prefixed to an edition of that poet's works, and also published separately. At the time he read this paper to the society he also laid before them, in connection with it, some *Critical Essays*, chiefly relative to dramatic poetry, which have not been published.

Mackenzie was himself a dramatic writer, though not a successful one. A tragedy written by him in early life, under the name of the *Spanish Father*, was never represented, in consequence of Mr. Garrick's opinion, that the catastrophe was of too shocking a kind for the modern stage; although he owned the merit of the poetry, the force of some of the scenes, and the scope for fine acting in the character of Alphonso, the leading person in the drama. In 1773 Mr. Mackenzie produced a tragedy under the title of the *Prince of Tunis*, which, with Mrs. Yates as its heroine, was performed with applause for six nights at the Edinburgh theatre. Of three other dramatic pieces by Mr. Mackenzie, the next was the *Shipwreck or Fatal Curiosity*, which might be described as an alteration of Lilly's play under the latter of the two names. The comedies entitled the *Force of Fashion* and the *White Hypocrite*, both of which were unsuccessful, complete the list. Mr. Mackenzie's grand deficiency as a dramatic author was his inability to draw forcible characters. His novels and tales charm by other means altogether; but in the drama, striking characters, and a skilful management of them, are indispensable.

In 1808 Mackenzie published a complete edition of his works in eight volumes. From that period, and indeed from one considerably antecedent to it, he might be said to have abandoned literature, though, to use his own affecting image, as employed at one of the meetings of the Royal Society, the old stump would still occasionally send forth a few green shoots. The patronage of the government was unfortunately extended in a somewhat improper shape, in as far as the office bestowed upon him, though lucrative, required unremitting personal labour. He was thus unable, even if he had been willing, to cultivate literature to any considerable purpose. Such leisure as he possessed he spent chiefly in healthy recreations—in shooting particularly, and angling, to which he was devotedly attached, and the former of which he had practised in early life on the ground now occupied by the new town of Edinburgh. He thus protracted his days to a healthy old age, until he finally stood amidst his fellow-men, like Noah amongst his descendants, a sole surviving specimen of a race of literary men—all of whom had long been consigned to the dust. His recollections of the great men who lived in his youth were most distinct and interesting; but it is to be regretted, that with the exception of what he has given in his *Life of Home*, he never could be prevailed upon to commit them to paper. The sole physical failing of his latter years was a slight deafness, which, however, seemed only to give him the greater power of speech, as, by a natural deception of the mind, he probably conceived that what was inaudible to himself was so, or ran the risk of being so, to his hearers also. At length, after a comparatively brief period of decline, he died, January 14, 1831, in the eighty-sixth year of his age.

By his wife, Miss Penuel Grant, daughter of Sir Ludovick Grant of Grant, Bart., and Lady Mary Ogilvie, Mr. Mackenzie had eleven children, the

eldest of whom was a judge of the Courts of Session and Justiciary—and a younger, Mr. Holt Mackenzie, one of the members of the privy-council.

As a novelist and essayist, Mackenzie still ranks in the first class, though perhaps rather by a reflection of his former fame, than through any active or sincere appreciation of his writings by the present generation. It is perhaps unfair to judge of the intellectual efforts of an author by any other age than his own, seeing that, as Johnson well remarks, the most of men content themselves if they only can, in some degree, outstrip their predecessors. Yet it is impossible to overlook that Mr. Mackenzie's works are not of a kind to retain the highest degree of popularity beyond the age in which they were written, and that they have been surpassed by many later writers, who, from the greater competition which they had to contend with, have not attained nearly so high an eminence. Mr. Mackenzie lived in an age, when to attain certain proprieties in language, was looked upon as almost the *summum bonum* of authorship of any kind; men had not yet become sufficiently at ease about the vehicle of their thoughts, to direct their attention solely, or even chiefly, as they do now, to the sense which is conveyed. Hence we find in his works a faultless sweetness and delicacy of diction, which, however, is only a mannerism, though not exactly that of an individual; while the whole scenery, incidents, and characters, instead of being taken directly from nature, are little more than a vivification of what have been the stock of fictitious writers from the commencement of the art. The *real life* with which Mr. Mackenzie was acquainted, must have been in a great measure the same from which Sir Walter Scott afterwards fashioned his immortal narratives; but this to Mackenzie Fashion had forbidden, and he had not the force to break through the rules of that tawdry deity. He was content to take all his materials at second-hand, to grapple only with that literary human nature, which, like certain dresses on the stage, runs through all books from perhaps some successful model of antiquity, without ever gathering a spark of the genuine article of the living world in its course. Dexterously, we allow, is the mosaic composed, and beautiful is the crust of sentiment in which it was presented. As works of art, the novels and minor stories of Mackenzie are exquisite; but, nevertheless, they could never have attained so great a celebrity, if they had not appeared at a time when mere art was chiefly regarded by the public, and when as yet men esteemed nature as something not exactly fitted for drawing-room intercourse.

While we thus with great deference express an unfavourable opinion of his merits as a writer of fiction, we allow to Mr. Mackenzie the highest credit as a moralist, and also as a composer of language, which is to be esteemed as no mean accomplishment, and depends more upon native gifts than is generally supposed. The moral sense of Mackenzie was in the highest degree pure, tender, and graceful; and has imbued his writings with a character for which they can hardly ever fail to be esteemed. "The principal object of all his novels," says Sir Walter Scott, "has been to reach and sustain a tone of moral pathos, by representing the effect of incidents, whether important or trifling, upon the human mind, and especially on those which were not only just, honourable, and intelligent, but so framed as to be responsive to those finer feelings to which ordinary hearts are callous." The sweet collocation of the words in which all these efforts are made, combines to render the effect, to an extraordinary degree, soothing, refining, and agreeable.

MACKINNON, COLONEL DANIEL. This brave soldier, who acquired high military reputation in the Peninsular war and at Waterloo, was born in 1791, and was second son of William Mackinnon, chieftain of the ancient clan of that name in the western Highlands of Scotland. This chieftainship, however, had dwindled into a mere lairdship, in consequence of the abolition of the patriarchal government in the Highlands, and Daniel, whose energies a century earlier might have been wasted in some petty feud or *spreagh*, was reserved to be one of the honoured heroes in a great European warfare. At the early age of fourteen he entered the army as ensign in the Coldstream Guards, and quickly won the esteem of his brother-officers by his activity, cheerfulness, and kind disposition, which was further increased when he had an opportunity of showing his valour in the field. His first service, however, was nothing more than a little harmless marching and countermarching; for his regiment, which was ordered to Bremen in 1805, to co-operate with the Prussians and their allies, never came in sight of the enemy. After its return, the Coldstream regiment, in 1807, was sent with the armament against Copenhagen, where the land-service was not in requisition. Two years more elapsed of mere warlike parade, which, however, was brought to an end when Mackinnon embarked with his regiment for the Peninsula in 1809, after he had attained in it the rank of lieutenant.

The military life of an officer so young as Mackinnon, and holding such a subordinate rank, can be nothing else than a record of personal daring and hairbreadth escapes; he obeys the commands and fulfils the wishes of his superiors, through every difficulty and at whatever risk, and thus establishes his claim to be a commander in turn. Such was the case with the subject of this brief notice. He was appointed aide-de-camp to General Stopford, who commanded the Guards, and had thus an opportunity of distinguishing himself through the whole course of that terrible and eventful war from 1809 to 1814. And these opportunities were neither shunned nor neglected, so that the bivouac and the mess-table were enlivened with tales of his personal prowess and daring. On one occasion his supreme contempt of danger partook of the ludicrous. While our army was passing a defile, and debouching from it, there was one spot in which part of the troops were exposed to a very heavy fire. But in this post of peculiar peril, Captain Mackinnon was found performing the duties of the toilet, and lathering and shaving his chin as coolly as if he had been fifty miles from the scene of action. No sight was better calculated to animate dispirited soldiers; they rushed immediately to the onset, and drove the French before them. No wonder that the soldiers loved and were ready to follow an officer who, let the risk be what it might, was ready to encounter or abide his full share. But he was equally endeared to his brother-officers by his overflowing kindness and invincible good nature, so that, during the whole of these trying campaigns, in which patience was tempted to the uttermost, he never gave offence, or adopted a subject of quarrel.

After having taken part in every battle from Talavera to Toulouse, the peace of 1814 released Mackinnon from active military duty. It is pleasing also to add, that his services had been appreciated, for he was at once raised from the rank of captain to that of lieutenant-colonel in the Coldstream regiment. Relying upon the promise of a lasting peace, he returned to England, but was suddenly roused, like many of his brethren upon leave of absence, by the escape of Bonaparte from Elba, and the astounding events that followed in quick succession. Napoleon

was once more upon the throne of France, and a fresh war was inevitable. Knowing this, Colonel Mackinnon hurried to Ramsgate to join his regiment, now quartered in Brussels, but not finding the expected vessel ready to sail, he threw himself, with another officer, into an open boat, and reached Ostend in time to join in the engagements of the 16th and 17th of June, and finally in the great battle of Waterloo.

Of the many hundreds of episodes that constitute this great military assize of the nations, out of which so many volumes of history and biography have been constructed, and amidst the *millé* of wonderful charges and brave deeds that occurred every moment, and over every part of the field, we must limit our attention to a thousandth part of the great event, and attend exclusively to the movements of Mackinnon. Amidst the fire, he had three horses shot under him. In one of these volleys by which he was successively brought down, he was himself shot in the knee, his sword flew from his hand, and in falling he alighted upon a prostrate French officer, who was wounded like himself. Mackinnon immediately took possession of the Frenchman's sword, with an apology for using it, as he had lost his own, mounted a fresh horse, and continued to charge at the head of his regiment, until he was detached with 250 of his Coldstreams, and 1st regiment of Guards, for the defence of the farm of Hougoumont. This was the key of Wellington's position, and Mackinnon was ordered to defend it to the last extremity. And well do the records of Waterloo testify how faithfully this command was obeyed. For a considerable period the whole interest of the conflict was converged round this farm and its outhouses, the possession of which was of the utmost importance to Napoleon, so that mass after mass of French grenadiers was hurled against it in rapid succession, with golden promises to the first who entered; but as fast as they approached the walls, the close steady fire from within tore their ranks into shreds, and strewed the ground with the dead and wounded; and as fast as they fell back, Mackinnon and his little band sallied from their defences, piled up the dead bodies in front of the doors as a rampart, and hurried back to their posts to await the fresh inundation of fire and steel that came sweeping down upon them. Again and again was this manœuvre successfully performed, but in the midst of imminent peril, by which the brave band of defenders was reduced to a handful. Still, the utmost efforts of Napoleon upon this point were defeated, and Hougoumont was saved. At last the farmhouse was relieved, and Mackinnon with his party joined the British army, now assailants in their turn. But the wound which he had previously received in his knee from a musket-shot, and which he had disregarded during the whole of the action, now occasioned such pain, accompanied with loss of blood, that he fainted, and was carried off the field in a litter to Brussels, where he was treated with the utmost courtesy and kindness. The wound was healed, but the buoyant activity which had hitherto made exercise a necessary of life to him was broken. As for the sword which he had appropriated to his own use at such a curious crisis, he not only used it gallantly in the defence of Hougoumont, and through the whole action, but ever afterwards wore it on field-days and parade, as a fair trophy of Waterloo.

Thus, at the early age of twenty-four, the military career of this intrepid soldier was closed by the return of universal peace—not, however, without a ten years' service, and having won by his merits a rank which few soldiers so young are privileged to occupy. He still continued to hold his commission in the

army; and a majority in the Coldstream having become vacant, he was induced to purchase it, by which he obtained the rank of a full colonel in the service, and the ultimate command of the regiment.

From the foregoing account it could scarcely be expected that Colonel Mackinnon should also obtain distinction in authorship. Entering the army at the raw age of fourteen, when a stripling's education is still imperfect, and returning to domestic life at a period when few are willing to resume their half-conned lessons, and become schoolboys anew, we are apt to ask, how and where he could have acquired those capacities that would enable him to produce a well-written book? But this, by no means the easiest or least glorious of his achievements, he has certainly accomplished. Soon after the accession of William IV. his majesty was desirous that a full history of the Coldstream Guards should be written, and he selected no other than the gallant colonel of the regiment to be its historian. Such a choice, and the able manner in which it was fulfilled, show that Mackinnon must have possessed higher qualities than those of a mere swordier however brave, and that he must have cultivated them with much careful application after his final return to England. For this, indeed, if nothing more than recreation had been his motive, there was an especial inducement, arising from his wound received at Waterloo, by which he was prevented from more active enjoyments. Although such a task required no small amount of historical and antiquarian research, the origin of the Coldstreams dating so far back as the year 1650, he ably discharged it by his work in two volumes, entitled *The Origin and Services of the Coldstream Guards*, published in 1833, and dedicated by permission to his majesty. In this work he has traced the actions of this distinguished brigade in England and Scotland during the wars of the Commonwealth, Restoration, and Revolution; its services in Ireland, in Holland, and upon the Continent; and finally in the Peninsula, and at Waterloo; and while he has shown a thorough acquaintanceship with the history of these various wars, his work is pervaded throughout not only with the high chivalrous magnanimity of a British soldier, but the exactness of a careful thinker, and the taste of a correct and eloquent writer.

The rest of Colonel Mackinnon's life may be briefly summed up, as it was one of peace and domestic enjoyment. After he had settled in England he married Miss Dent, the eldest daughter of Mr. Dent, M.P. for Pool, a young lady of great attractions, but who brought him no family. With her he led a happy and retired life, surrounded by the society of those who loved him; and cheered, as we may well think, by those studies which he turned to such an honourable account. It was thought that, from his strong robust frame and healthy constitution, he would have survived to a good old age; but the sedentary life to which his wound confined him, proved too much for a system so dependent upon active and exciting exercise. After having scarcely ever felt a day's illness, he died at Hertford Street, May Fair, London, on the 22d of June, 1836, being only forty-six years old.

MACKINTOSH, SIR JAMES, a distinguished historian and statesman, was born on the 24th of October, 1765, at Alldowrie, the residence of his grandmother, situated on the banks of Loch Ness, about seven miles from Inverness. He was in his own person, being the eldest of three children, the representative of the Killochy branch of the family of Mackintosh (a property which they acquired in the

fifteenth century), and was the eleventh in descent from Allan, third son of Malcolm, the tenth chief of the clan, who was one of the leaders in the celebrated battle of Harlaw, fought in 1411. The lairds of Killochy, as the eldest branch of the Mackintoshes extant, were always captains of the watch (a feudal military appointment) to the chief of the clan, and acted in this capacity in all the hostilities in which he happened to be engaged.

John Mackintosh of Killochy, father to the subject of this memoir, held a commission for several years in Campbell's Highlanders, and was wounded in the Seven Years' war in Germany. He was afterwards a captain in the 68th regiment, and served with this corps for a considerable time in Gibraltar and other places abroad. He was a man of amiable manners and disposition, and much esteemed by all who knew him. Sir James' mother, Marjory Macgilivray, who died at Gibraltar while he was yet a child, was a daughter of Alexander Macgilivray, Esq., of the state of Carolina.

From a very early period of life Sir James discovered a singular propensity to reading—a passion which his father, who had been himself accustomed to an active life, and who desired that his son's pursuits should be of a more stirring kind, endeavoured, but in vain, to subdue. Little foreseeing the eminence to which this studious disposition was one day to raise him, he twitted the boy with his sedentary and monotonous life; telling him, with the view of rousing him to an interest in what was passing around him, that he would become a mere pedant. His attachment to books, however, was too deeply seated in his nature to be removed by such sarcasms, and his father's opposition had the effect only of driving him to do that by stealth which he had done before openly. He rose at midnight when the family had retired to rest, lighted his candle, and pursued his solitary studies unmolested till the approach of morning.

In consequence of his father's being much abroad, the care of young Mackintosh devolved chiefly upon his grandmother—a woman of superior endowments, and to whom he was in a great measure indebted for his early mental discipline. When of sufficient age to leave home, the future historian and statesman was sent to the academy of Fortrose, then the most distinguished seminary in that part of Scotland, and placed under the tuition of Mr. Stalker, one of the masters. Here young Mackintosh rapidly acquired a marked superiority over all his schoolfellows, and his future fame was shadowed forth in a local reputation which gave to "Jamie Mackintosh" the character of a prodigy of learning and talent. His master entertained a similar opinion of him, and, as a proof, devolved upon him, while yet a mere boy, nearly the entire management of the classical department of the school. At this period too he began to discover that talent for oratory and declamation by which he so eminently distinguished himself in after-life. The eloquence, however, on which latterly "listening senates hung" was at this period poured out from the top of the grave-stones in the churchyard of Fortrose, on which the young orator used to mount in moments of enthusiasm, and declaim from Shakspeare and Milton to a wondering, gaping, and admiring audience of his schoolfellows. The political opinions which distinguished Mr. Mackintosh throughout his life were also very early formed. He was said by a lady, a relative of his own, to have been "born a Whig," but he certainly was not this by inheritance, for his friends and connections were all staunch Tories and Jacobites, and they did not view without regret and sorrow the apostasy of this scion of the house of

Killochy. The youthful fancy, however, of the heir to that venerable title had been captivated by the descriptions of the democracies of Greece and Rome, which he found in his favourite classics, and he formed opinions of his own on the subject of political freedom with but little reference to the creed of his family. Pym, Hampden, and Algernon Sidney were the objects of his idolatry; their example excited him, and their writings imbued him with those political principles which "grew with his growth, and strengthened with his strength." The Utopian notions, however, which so often misled men of weak minds, had no such effect on Mr. Mackintosh. He saw the necessity of sobering down all such fanciful theories to the level of real life. He was above all impressed with the necessity of circumscribing his ideas of political freedom by the great outlines of the British constitution. In his own impressive and figurative language, he desired, that the light which might break in on England should be "through well-contrived and well-disposed windows, and not through flaws and breaches, the yawning chasms of our ruin."

The singular talents which young Mackintosh discovered while at Fortrose, and the extraordinary proficiency which he made in his studies, determined his friends to bestow upon him a university education, and he was accordingly, through the kindness of a relative, placed in King's College, Aberdeen, under Mr. Leslie. He here also attended the lectures of James Dunbar, LL.D., professor of moral philosophy, and Mr. William Ogilvie, professor of humanity. While at Aberdeen he formed an acquaintance and intimacy with the late Rev. Robert Hall of Leicester, which continued throughout their future lives. They were inseparable while at college, and a biographical sketch of his deceased friend was amongst the last literary efforts of Mackintosh. It was intended for the new edition of Mr. Hall's works, published by Dr. Gregory.

Having acquired a complete knowledge of Greek and mathematics, Mr. Mackintosh, who had now determined on adopting the medical profession, repaired to Edinburgh to complete his education at the university of that city. Here he attended the lectures of Dr. Cullen and Professor Black, preparatory to his taking the degree of Doctor of Medicine, and applying himself to regular practice in that profession. He also joined the well-known literary club called the Speculative Society, instituted in 1764, in which he became a keen debater, and distinguished himself by the boldness of his opinions, and the ability and eloquence with which he expounded and maintained them. Amongst his associates at this period were Mr. (afterwards Lord) Gillies, Mr. (afterwards Lord) Moncrieff, and the Earl of Lauderdale; and amongst the number of his friends, the illustrious author of the *Wealth of Nations*, who early discovered, and warmly encouraged, the promising talents of the young orator.

It was at this period that Mr. Mackintosh's mind became seriously directed towards general literature, and to moral, political, and speculative philosophy, the result of his studying, which he did with the most serious attention, the works of Robertson, Smith, Clark, and Brown, who were then in the zenith of their fame. Having received his medical degree, although he had now determined to abandon that profession, to which indeed he had never been attached, he set out for London in the year 1787, in company with the eldest son of Sir James Grant of Grant, who had about this period become knight of the shire for the county of Moray. Undetermined as to his future pursuits, he lingered idly about the

metropolis for some time, made a short visit to the Continent, and finally returned to study law, having fairly parted with physic. In the year following, viz. 1788, he succeeded, by the death of his father, to the estate of Killochy, now worth about £900 per annum. Method and economy, however, were not at this period amongst the number of Mr. Mackintosh's virtues, and notwithstanding this handsome accession to his means, he soon found himself involved in such pecuniary difficulties as compelled him to part with his patrimonial inheritance for the very inadequate sum of £9000. Still but loosely attached to his professional studies, he now directed his attention to the science of politics, and in 1789 published a pamphlet on the *Regency Question*, in which he asserted the constitutional right of the heir-apparent to supply his father's place in the circumstances which then gave rise to the discussion. Pitt's theory, however, prevailed, and thus the first published literary essay of Mr. Mackintosh was found upon the losing side. Hitherto he had attracted but little public notice, and had been foiled in his attempt to obtain political celebrity. Both of these, however, were awaiting him, and on no distant day. In 1791 he published his celebrated work entitled "*Vindiciæ Gallicæ*, or a Defence of the French Revolution and its English Admirers, against the Accusations of the Right Honourable Edmund Burke; including some Strictures on the late Production of Monsieur de Calonne," an octavo volume of 379 pages. This work he sold, while yet but partly written, for a trifling sum; but the merits and success of the production induced the publisher to depart from the original contract, and to give its author triple the sum stipulated for. The first two editions were disposed of within four months; and a third appeared in the end of August, 1791. The extraordinary talent which this work displayed, procured Mr. Mackintosh an extensive and illustrious circle of acquaintances, in which were, amongst others, Sheridan, Grey, Whitbread, Fox, the Duke of Bedford, and his celebrated antagonist Burke himself, who, soon after the appearance of the *Vindiciæ*, opened a correspondence with him, and it is said succeeded in changing and modifying to a considerable extent many of the opinions of its author.

Mr. Mackintosh now (1792) entered himself as a student of Lincoln's Inn, and in 1795 was called to the bar by that society; but did not for several years thereafter attain any considerable practice. He attended the courts, however, and went the Norfolk circuits, but without much improvement to his business.

With the view of enlarging his income, which the want of professional success kept within narrow bounds, he, in the year 1798, announced his intention of delivering a course of lectures on "The Law of Nature and of Nations." A suspicion of his motives in a political point of view raised some obstacles in the way of this attempt; but these being effectually removed by his introductory lecture, which was printed under the title of *A Discourse on the Law of Nature and of Nations*, and which drew the most flattering eulogiums from both Mr. Fox and Mr. Pitt, he was permitted to proceed, and delivered his course in Lincoln's Inn Hall to a large and respectable audience. These "Discourses" are allowed by all to comprehend nearly every excellency which human sagacity and human intelligence can bring to bear on such subjects; profundity and felicity of thought, high intellectual power, and chaste and elegant language.

After the general election of 1802 Mr. Mackintosh was retained as counsel in several controverted cases,

and acquitted himself with great ability before committees of the House of Commons, but still without attracting much public notice as a barrister. Next year, however, a case was put into his hands which at once gained him the highest professional reputation. This was the defence of M. Peltier, editor of *The Ambigu*, a French journal, for a libel against Bonaparte, then first consul of France, and at that time at peace with this country. The trial took place on the 21st of February, 1803, in the Court of King's Bench. Mr. Mackintosh stood alone and unsupported in the defence of Peltier, against an array of talent on the opposite side which nothing but a strong confidence in his own abilities and intellectual resources could have enabled him to encounter. His principal antagonists in this case were Mr. Perceval, at that period attorney-general, afterwards prime minister, and Mr. Abbot, afterwards Lord Tenterden. Mr. Mackintosh's pleading on this celebrated trial was one of the most masterly efforts of the kind which had ever been witnessed. It was one continued strain of powerful, impressive, and classical eloquence. His whole energies were concentrated in the effort, and the whole stores of his vast and retentive memory, and of his elegant and felicitous fancy, were brought forth and mingled with the current of his eloquence, imparting to it a richness which great and original minds only can produce. His speech on this occasion was declared by Lord Ellenborough to be "the most eloquent oration he had ever heard in Westminster Hall." A still more flattering compliment was paid the orator by Madame de Stael, who translated the speech into French, in which shape it was circulated throughout Europe.

Mr. Mackintosh was at this period professor of general polity and the laws in the East India College at Hertford, an appointment which the reputation he had acquired from his *Lectures on the Law of Nature and of Nations* had obtained for him; but the splendid display of talent which he had exhibited in his defence of Peltier procured him much more powerful patronage, and opened up to him prospects more commensurate to his deserts. He now attracted the notice of the government, and was offered in the same year the recordership of Bombay. This appointment he accepted, though not without some hesitation, and before setting out he received the honour of knighthood. He remained in Bombay for seven years, discharging the grave and important duties of a chief judge with uprightness, integrity, and ability, and qualifying the severity of the law with judicious clemency and mercy. A remarkable and beautiful instance of this occurred during his recordership in Bombay. Two young natives were brought before him, tried and convicted of having conspired to waylay and murder a Dutchman from Cochin. The penalty attached to the crime by the law was death. Some circumstances in the case, however, afforded Sir James an opportunity of extending mercy to them so far as to save their lives, and he availed himself of it. The prisoners were in the meantime withdrawn from the bar, and during this interval came to a resolution, between themselves, of murdering their judge when they should be called up to receive, as they expected, sentence of death, and for this purpose they provided themselves with knives. The design of the ruffians was most providentially discovered in sufficient time to prevent its being carried into effect. The sequel, a story worthy of the best days of Rome, will be best told in the address of Sir James to the culprits, when they were brought again before him to receive the commuted sentence. "I was employed," he said, "in considering the mildest judgment which public

duty would allow me to pronounce on you, when I learned from undoubted authority that your thoughts towards me were not of the same nature. I was credibly, or rather certainly informed, that you had admitted into your minds the desperate project of destroying your own lives at the bar where you stand, and of signalizing your suicide by the previous destruction of at least one of your judges. If that murderous project had been executed I should have been the first British magistrate who ever stained with his blood the bench on which he sat to administer justice. But I could never have died better than in the discharge of my duty. When I accepted the office of a minister of justice, I knew that I ought to despise unpopularity and slander, and even death itself. Thank God I do despise them; and I solemnly assure you that I feel more compassion for the gloomy and desperate state of mind which could harbour such projects, than resentment for that part of them which was directed against myself. I should consider myself as indelibly disgraced, if a thought of your projects against me were to influence my judgment." He then passed sentence on them to be imprisoned for twelve months, the exact amount of punishment he had originally proposed.

During his residence in India, Sir James contributed a number of valuable papers to the *Asiatic Register*, and supplied Dr. Buchanan with a large quantity of material for his voluminous works on India. His return to England was hastened by a severe illness. He left Bombay in November, 1811, retiring from the recordership with a pension of £1200 per annum.

In July, 1813, a little more than twelve months after his arrival in his native country, he was elected, through the interest of Lord Cawdor, as representative for the county of Nairn; an occasion which called him to visit the friends and the scenes of his youth; and no man could be more feelingly alive to associations, which the contemplation of objects familiar to our boyhood, and from which we have been long absent, is calculated to produce. In 1818 he was elected for Knaresborough in Yorkshire, through the influence of the Duke of Devonshire, and was re-chosen at the subsequent elections of 1820, 1826, 1830, and 1831. He was also elected lord-rector of the university of Glasgow in 1822, and again in 1823. Sir James was now become a person to whom a national importance was attached; one of the marked and elevated characters of the country, who had acquired a conventional right to take an active and prominent part in the management of her affairs; and, in consequence, he was appointed in 1828 one of his majesty's privy-council, and on the formation of Earl Grey's administration in 1830 he was made on the 1st December a commissioner for Indian affairs.

In parliament Sir James took a prominent part in all questions connected with foreign policy and international law, but more especially distinguished himself in the discussions on the alien bill, the liberty of the press, religious toleration, the slave-trade, the settlement of Greece, reform in parliament, and on the right of our colonies to self-government. But a question still more congenial to his philanthropic disposition than any of these, devolved upon him on the death of Sir Samuel Romilly. This was the consideration of the best means of amending the criminal law—a code which he had always thought much too sanguinary, and therefore but ill adapted for the ends to which all laws ought to be directed. He thought with Goldsmith, that "a man might see his last crime without dying for it; and that very little blood would serve to cement our security."

His speeches on this subject are full of the most enlightened and statesmanlike views, and combine, in a wonderful degree, all the beauties of eloquence with profound reasoning and just and noble sentiment. So beautiful, indeed, are they, and so powerful the arguments which form their framework, that it excites a feeling of surprise in the reader to find that they did not instantly accomplish their object. They appear irresistible, and seem to comprehend every argument on the point at issue which human ingenuity could devise. As chairman of a committee of the House of Commons on the criminal law, in 1819, Sir James Mackintosh introduced six bills in the course of May, 1820. But three only of these were at the time persisted in, and in the commutation of punishment bill, seven of the eleven offences which it was intended to commute were expunged in the House of Lords, four only being suffered to remain.

Sir James Mackintosh, as already noticed, was in politics a Whig, and all his votes and speeches in parliament were in favour of the opinions and sentiments of that party; but he was perhaps one of the most tolerant of politicians, the natural mildness and benevolence of his disposition never failing to mingle largely in whatever character he assumed, whether author, statesman, or judge. In all he was the same—amiable, forbearing, and conciliating.

One of Sir James' last speeches in parliament was on the bill relating to anatomical dissections, in which he strenuously advocated the propriety, nay necessity, of affording to the profession every facility for obtaining subjects for the dissecting table. His speech on this occasion was remarkable for all that elegance of diction and cogency of argument which distinguished his rhetorical effusions; and indicated, besides, a love of science on the part of the speaker, and a zeal for the welfare of mankind, worthy of a great statesman and of a great philanthropist.

Great as Sir James Mackintosh certainly was as an orator, he was yet greater as an author, and the fame which he derives from the latter character stands on still higher and firmer ground than that on which the former is rested. The *Vindiciæ Gallicæ*, published when the author was only in the twenty-sixth year of his age, is an eloquent and powerful political treatise. On all the grand points on which he meets Mr. Burke—the expediency and necessity of a revolution in France—the character of the national assembly—the popular excesses which attended the revolution, &c.—it may be safely assumed, that he obtains the mastery in truth and cogency of argument. It ought to be remembered, that the French revolution had not at this time put on its worst aspect. The great change which had taken place promised to regenerate France, and to renovate civil society; and Sir James Mackintosh, like his master Fox, in his exultation at the dawn of so bright a prospect, could not foresee that it would terminate in bloodshed and tyranny.

Both works are written in a style too ornate and artificial. The rich and fertile genius of Burke, and his vast and multifarious stores of learning, crowded his pages with illustrations from all sources—from history, philosophy, and poetry—and he was not over-solicitous as to their being apposite and correct. On the other hand, Sir James Mackintosh, fresh from his books and burning with zeal, was also ambitious of display, and chastity and purity of diction were neglected by both. Such a contest, however, so splendid a specimen of the literary *duello*, on so magnificent an arena, may not again occur for a considerable length of time. The defence of Peltier is also a masterly performance; but the dissertation

in the *Encyclopædia Britannica*, and his "Life of Sir Thomas More" in Dr. Lardner's *Cyclopædia*, are perhaps the most finished of the acknowledged productions of Sir James Mackintosh. The two volumes of his abridged *History of England* serve rather to show the views he took of certain points of English history, and the philosophy he was able to bring to the task, with his habitual carelessness in minor details, than his talent at composing a connected, consecutive work. These two little volumes,¹ however, contain some striking passages and disquisitions. But in the opinion of Mr. Campbell, who knew Sir James Mackintosh intimately, they were merely the expansion of the prefatory matter which he intended for a great historical work on the affairs of England since the Revolution, and which he had contemplated for several years, and in part written, but was too much impeded in his progress, both by his parliamentary duties and the infirm state of his health, to bring to a conclusion. His labours were, nevertheless, given to the world in 1834, in the form of a disquisition on the causes of the revolution of 1688, exemplifying in its style an excellent dogma of the author, that history ought to be written with feeling, but without passion. He also contributed to the *Edinburgh Review* in its earlier days. An edition of his works, in three volumes (with the exception of the *History of England*) was published in 1846, containing his ethical and historical dissertations, a number of essays on political and literary topics, reviews, and other contributions to periodical publications, and speeches on a variety of subjects delivered at the bar and in parliament.

After what has been said of Sir James Mackintosh's public life and character, it is almost unnecessary to add, that in private life he displayed all the domestic virtues, and all the better qualities of human nature. He was mild, benevolent, generous, humane, and unaffected. Ready at all times to succour the unfortunate and the distressed, he bestowed on all who sought it that assistance which their circumstances required; whether it was his time, his purse, or his advice; and to all three, if desired, the applicant was welcome. The most pleasing characteristic of Hume—that almost infantine simplicity which his friends remarked in his intercourse with them—mingled also in the character of Mackintosh, contrasting finely with its nobler parts. His conversational powers were of the very first order, and never failed to delight all who had the good fortune to enjoy his society. His person was well formed, and above the middle stature. His countenance was intelligent, and exhibited a pleasing compound of grave and gay expression, indicative of a readiness to sympathize with either of these feelings, as chance might direct their appeals to him.

Sir James was in an indifferent state of health for some time previous to his death, but that melancholy event was finally brought on by an accident. While at dinner, about the beginning of March, 1832, a portion of the breast of a fowl, with a fragment of bone in it, which he had attempted to swallow, stuck in his throat, and though afterwards extracted without producing any immediate serious consequences, the accident completely unsettled his general health. His debility from that hour daily increased, till the 30th of May, when he died, in the sixty-sixth year of his age, at his house in Langham Place, having anticipated and met the hour of his dissolution with a firmness and resignation worthy of his past life. He was buried at Hampstead.

¹ The greater part of a third volume was written by Sir James: he breaks off at the era of the Bartholomew massacre.

Sir James Mackintosh was twice married; first in 1789, to Miss Catherine Stewart of Gerrard Street, Soho, sister to the Messrs. Stewart, formerly proprietors of the *Morning Post*, by whom he had issue a son, who died in infancy, and three daughters—viz. Mary, married to Claudius James Rich, Esq., of Bombay—Maitland, married to W. Erskine, Esq.—and Catherine, married to Sir W. Wiseman, Bart. Mrs. Mackintosh died in 1797. He was afterwards married to Catherine, daughter of J. B. Allen, Esq., of Cressella, in Pembrokehire. By this lady, who died at Chesne, near Genoa, on the 6th May, 1830, he had one son and a daughter—viz. Robert Mackintosh, Esq., B.A., fellow of New College, Oxford; and Frances, married to H. Wedgewood, Esq., Staffordshire.

MACKNIGHT, DR. JAMES, a learned scriptural commentator, was born on the 17th of September, 1721. His father, Mr. William Macknight, minister at Irvine, was a native of Ireland, where his ancestors, descended from the family of M'Naughtane, in the Highlands of Scotland, had resided for more than a century. Mr. William Macknight early displayed very popular talents as a preacher; and having, it is said, accidentally officiated in the church of Irvine, sometime after the death of the former incumbent, he gave so much satisfaction to the hearers, that in consequence of a general wish expressed by the parishioners to the patron, he was soon appointed to supply the vacant charge. In this situation he continued during life, universally esteemed for genuine piety, purity of morals, and integrity of character.

Mr. James Macknight, the subject of this memoir, received the rudiments of education at the school of Irvine; and about the age of fourteen was sent to the university of Glasgow, where he studied with great approbation from his teachers, on account of his diligence and proficiency. The notes he then took from the lectures on logic and moral philosophy, before he was sixteen, still remain among his papers, and afford remarkable indications of the same acuteness and soundness of judgment which afterwards characterized his theological writings.

Having completed the usual course of academical discipline at Glasgow, Mr. Macknight went to Leyden, in order to prosecute the study of theology, to which he had shown an early attachment. While he remained in Holland, he had an opportunity of procuring many valuable books, written by foreign divines, which afterwards assisted his own labours in explaining Scripture. After his return to Scotland, having received license from the presbytery of Irvine to preach the gospel, he was chosen to officiate in the Gorbals, a district of Glasgow; a situation which at that time could be held by a licentiate of the church before being ordained to the pastoral function. On this occasion one of the candidates was Mr. Robert Henry, afterwards the well-known historian of Great Britain. It chanced that the gentlemen who were thus placed in competition with each other at the commencement of life, were at last, after an interval of many years, associated as colleagues in the charge of the Old Church parish of Edinburgh.

From the Gorbals Mr. Macknight went to Kilmarnock, in consequence of an invitation from Mr. Fergusson, then minister of that place; and acted for some time as his assistant in the charge of the parish. Here he conducted himself with such propriety, that his character began to be established; and on the death of Mr. Fisher at Maybole, he obtained the vacant living there, with the concurring wish of the heritors and people. Of this charge accordingly he was ordained as minister, on the 10th

of May, 1753. At Maybole Mr. Macknight continued sixteen years, and discharged the duties of the pastoral office with such assiduity and kindness, that, when he left it, he carried with him the affections and regret of all his flock. It may be mentioned as a pleasing evidence of their attachment, that when he proposed accepting a presentation to the living of Jedburgh, many respectable inhabitants of the parish of Maybole joined together in earnestly soliciting him to remain as their pastor; and, in order to obtain his compliance with this request, they offered, not only to augment the value of his income, but to provide him an assistant, should the state of his health render it necessary. This generous proposal, however, he judged it proper, from prudential considerations, to decline.

It was at Maybole, that, amidst his professional occupations in a populous charge, Dr. Macknight composed the first and second of his works. Of the former, indeed, or the *Harmony of the Gospels*, it appears from his papers that the plan had been conceived by him so early as the third or fourth year of his attendance at the university; and from that time he began to collect materials for the publication. The first edition of this book was published in 1756. Although the plan of it differed considerably from that of former harmonies in supposing that the evangelists have not neglected the order of time in the narration of events, the reception it met with from most competent judges was so favourable that the author was encouraged to undertake a second edition, with considerable improvements and additions. This edition appeared in 1763. In the same year was also published by Dr. Macknight another performance of great merit, entitled the *Truth of the Gospel History*, which had been the fruit of the author's studies during the interval between the first and second editions of his *Harmony*. Its object is to illustrate and confirm, both by argument and by appeal to the testimony of ancient authors, what are commonly arranged under the three great titles of the internal, the collateral, and the direct evidences of the gospel history.

By these publications Dr. Macknight soon obtained a high reputation for theological learning. The university of Edinburgh conferred on him (among the first who obtained that distinction in Scotland) the degree of Doctor of Divinity; and he was in 1769 chosen moderator of the General Assembly of the Church of Scotland. During the course of the same year he was translated to the parochial charge of Jedburgh, in which he remained about three years, and where he received from his people the most flattering tokens of respect and kindness. In 1772 he was elected one of the ministers of Edinburgh—a preferment for which he was chiefly indebted to the long-continued and steady friendship of the very respectable and highly-esteemed family of Kilkerran. His first charge in Edinburgh was the parish of Lady Yester's, from which he was translated in 1778 to the Old Church, where he continued during the remainder of his life.

Besides performing the ordinary duties of the pastoral function, a minister of Edinburgh, in virtue of his office, is much occupied with public meetings on business of various kinds, especially the management of the different charitable foundations which have long been the boast of the capital of Scotland. On these, accordingly, Dr. Macknight, though he entertained some doubts respecting the good effects of such institutions, bestowed much of his attention; and his judicious counsels of management were undoubtedly productive, at that time, of considerable benefit, in maintaining the strictness of their discip-

line as well as the purity of their administration. Among other objects of such official care, is the fund established by act of parliament for a provision to the widows and children of ministers in the Church of Scotland. As one of the trustees appointed by the act, he had long taken a leading part in conducting the business of this charity; and after the death of Dr. Webster, he was appointed joint-collector with the Rev. Sir H. Moncrieff Wellwood, Bart.

In the church courts he acted steadily on that system of ecclesiastical policy which for many years had guided the decisions of the General Assembly. At the same time he firmly resisted whatever appeared to him as any infringement on the constitutional law or practice of the church; and accordingly, when some of his moderate friends wished for the abolition of calls, as an unnecessary form in the settlement of ministers, he moved and carried a resolution of the Assembly of 1782 (relative to certain overtures on the subject, then under the discussion of the house), "declaring that the moderation of a call in settling ministers is agreeable to the immemorial and constitutional practice of this church, and that it ought to be continued;" a resolution which was afterwards converted into a declaratory act, and printed as such in the proceedings of the Assembly for that year.

But what chiefly engaged his mind and occupied his time, after he became a minister of Edinburgh, was the execution of his last and greatest work on the *Apostolical Epistles*; which was published in 1795, in four volumes quarto. Respecting this work, it is perhaps not unworthy of being told, that it was the result of the unremitting labour of almost thirty years; that, notwithstanding his numerous professional avocations, the author, while composing it, was seldom less than eleven hours every day employed in study; and that before it came to the press, the whole manuscript had been written no less than five times with his own hand. At the time of publishing the *New Translation of the Apostolical Epistles, with a Commentary and Notes*, Dr. Macknight was highly indebted to the patronage of the Duke of Grafton; and after the work made its appearance, he received the most honourable testimonies of approbation from many of the bishops and respectable dignitaries of the Church of England, as well as from the ablest divines of all descriptions.

After the publication of this work Dr. Macknight considered himself as having accomplished the greatest object of his life; and wishing to enjoy at the end of his days some relief from the labour of study, he resisted the repeated solicitations of his friends, who earnestly urged him to undertake the illustration of the book of the Acts, on the same plan which he had so successfully followed in explaining other parts of the New Testament. But soon after this period, from the want of their usual exercise, a sensible decline of his faculties, particularly a failure of his memory, was observed by his family. This fact is a striking instance of the analogy between the powers of the body and those of the mind, both of which suffer by inaction; and it furnishes a useful caution to those who have been long habituated to any regular exertion of mind, against at once desisting entirely from its usual efforts; since the effect, in the course of nature, is not only to create languor, but to hasten the progress of debility and failure.

As yet, however (1796), Dr. Macknight's bodily vigour seemed to be but little impaired. In early life he was afflicted with frequent headaches, but after he had reached the age of thirty they seldom returned; and he afforded a singular instance of a sedentary life long continued, with hardly any of

those complaints which it usually induces. This uninterrupted enjoyment of health he owed, under Providence, to a naturally robust make, and a constitution of body uncommonly sound and vigorous, along with regular habits of temperance, and of taking exercise, which he did by walking nearly three hours every day.

Having finished the task he had prescribed to himself as an author, he mingled frequently in the society of his friends, from which, at intervals, he had always received much enjoyment; and long retained the same cheerfulness of temper for which, at the hours of relaxation from severe study, he had been remarkable when in the company of those whom he esteemed. Even after the symptoms of his decline were become visible (1798), his natural sagacity and strength of judgment, as well as his extensive and familiar knowledge of the Scriptures, were still to be discerned in his conversation and public appearances. And so habitual was his anxiety to discharge his duty, that he insisted on officiating for a considerable time after his friends had wished him to withdraw from public labour. It was not, indeed, without much entreaty that he at last consented to accept the services of an assistant.

The disease which terminated his life was the peripneumonia notha, occasioned by an incautious exposure to the severity of the weather, about the end of December, 1799. This distemper, in its progress and issue, resisted the ablest and most assiduous efforts of medical skill. During his illness his mind was composed, tranquil, and resigned; he never complained; and on the morning of the 13th of January, 1800, he expired without a struggle. As in the course of the preceding night he slept but little, the time was employed in hearing passages from the Psalms and Evangelists, which by his own desire were read to him by one of his family. Thus, having spent his life in illustrating Scripture, and exerted the last efforts of his attention in listening with delight to its precious words, he may be truly said to have slept in Jesus.

As a clergyman, the sentiments and conduct of Dr. Macknight were equally characterized by consistency and propriety. In the discharge of every public and private duty of religion, with a constant reliance on divine aid, he was regular and steady. He knew and felt what was becoming in the sacred office which he held; and never departed, on any occasion, from the dignity or decorum of his professional character. Having given himself wholly to the meditation of divine things, he continued in them: in the work of his Master he was steadfast and faithful to the end. His piety was at once sincere, rational, and without ostentation. To be useful in the cause of truth and virtue was his highest ambition; and with all the means of attaining this end which the resources of a well-informed and liberal mind could supply, he united a zeal for the interests of Christianity which terminated only with his life.

When engaged either in private controversy or in the public debates of the church courts, he was always remarkable for speaking strictly to the point at issue. He was likewise distinguished by coolness, discretion, and command of temper; he listened with patience to the arguments of his opponents; and in delivering his opinions he showed himself uniformly open, candid, and explicit. At the same time his talent was rather that of business than of address; he appeared to be better fitted for deciding on the merits of a question in debate, than for soothing the passions or managing the humours of mankind—a qualification rarely possessed but by minds of a superior order.

On various subjects besides those embraced by his profession, his range of knowledge was ample and profound. He perused the writers of antiquity with critical skill; and of his acquaintance with the Greek language, especially the original of the New Testament, his observations on the force of the particles, in his commentary, are a sufficient proof. In the speculations also of metaphysical, moral, and mathematical science, he was a considerable proficient. The fact is, his powers were such as might have been turned with advantage to any department of knowledge or learning.

It may further be noticed, that in conducting the ordinary affairs of life he displayed uncommon prudence and sagacity. He was one of those who are generally attentive to small concerns, but on proper occasions show themselves liberal to a high degree. Of this, different instances occurred in the course of his transactions with his friends; and he was enabled to act on such a principle of generosity, by his usual habits of economy and prudence. Dr. Macknight's external appearance was sufficiently expressive of his character. His countenance was manly and commanding, and his gait remarkably erect and firm.

Dr. Macknight's *Harmony of the Gospels* has long been esteemed a work of standard excellence for the students of evangelical knowledge. His *Truth of the Gospel History* has hitherto attracted the notice of the public less than any of his other productions; but it well deserves to be more generally read; since of what it proposes to establish, it contains the most satisfying views that can be suggested by learning, acuteness, and good sense, and is admitted by the best judges to be a performance as useful and instructive as any we have on that important subject. It is, in fact, a kind of storehouse, from which subsequent writers on the same subject have borrowed largely in point of argument and illustration.

The *Commentary on the Apostolical Epistles* is now held in peculiar estimation: and it may be doubted whether the scope of the sacred authors of these writings was ever, in any former age of Christianity, more fully, clearly, and happily stated, than has been done by Dr. Macknight in the general views and illustrations which he has prefixed to the several chapters of the Epistles.

The life of the Apostle Paul, which concludes the fourth volume of the *Translation and Commentary*, is an excellent compendium of the apostolical history, and may be considered as the author's view and illustration of the Acts of the Apostles—the only part of the New Testament writings (besides the Revelation) to which the labours of Dr. Macknight as a commentator were not directed. In all his writings his style, though unambitious of elegance or ornament, is perspicuous and appropriate to the subject.

All Dr. Macknight's works were originally printed in quarto. Of the *Harmony* and the *Epistles* many editions have since been published in octavo. To show the respect which has been paid in England to his various works, the following passage from the *Library Companion* of the Rev. T. F. Dibdin may be quoted. After recommending to the young theologian the works of Lardner, Doddridge, and Watts, Mr. Dibdin says, "Nor let the name of Macknight be forgotten. His works, indeed, are the more exclusive property of the *disciplined theological* student; but the *general* reader will do well to secure his inviting quartos upon the *Gospels* and *Epistles* of the New Testament. In these he will find learning without pedantry, and piety without enthusiasm. In short, no theological collection can be perfect without them. If any man may be said to have exhausted his subject, it is Macknight."

Soon after the time of his being ordained, Dr. Macknight married Elizabeth M'Cormick, eldest daughter of Samuel M'Cormick, Esq., general examiner of the excise in Scotland. Of his family the only one remaining became a clergyman of the Church of Scotland.

MACLAURIN, COLIN, an eminent mathematician and philosopher, was descended from an ancient and respectable family, which had long been in possession of the island of Tiree, a solitary but comparatively fertile member of the Hebridean range. His grandfather, Daniel M'Laurin, removed thence to Inverary, and contributed greatly to restore that town, which was nearly ruined in the civil wars. He wrote some memoirs of his own times, and appears to have been a man of superior abilities. John, the son of Daniel, and father of Colin, was minister of the parish of Glendaruel, where he was greatly beloved as a faithful and diligent pastor; he completed a version of the Psalms in *Irish*, which was generally used in those parts of the country where divine service was performed in that language. He married a lady of the name of Cameron, by whom he had three sons. John, the eldest, was for many years one of the ministers of the city of Glasgow, and well known as the author of several essays and sermons; he was also one of the most popular preachers of his day. Daniel, the second son, died at an early age, after having given proofs of surprising genius; and Colin, born at Kilmoddan, in the month of February, 1668. His father died six weeks after, but the loss to the family was not so severely felt as it otherwise might have been, on account of the kind advice and benevolent attention of a worthy uncle, the Rev. Daniel MacLaurin, minister of Kilfinnan, and the careful economy and exemplary virtues of their mother. After remaining in Argyleshire for some time on a small patrimonial estate, which was divided between Mrs. MacLaurin and her sisters, she removed to Dumbarton, for the more convenient education of her children; but dying in 1707, the entire charge of the orphans devolved upon their uncle. Colin, at this time, was nine years old; and although of a delicate constitution, he was remarkable for the quickness of his apprehension and the retentiveness of his memory; he was passionately fond of learning, and pursued his studies with so much zeal and satisfaction, as to be fully qualified to enter the university of Glasgow in two years after his mother's death. He was accordingly placed there under the direction of Mr. Carmichael, an admirable public teacher, who took the greatest pains in superintending his education, and for whom Mr. MacLaurin ever after in life evinced the warmest feelings of gratitude and respect. His proficiency in every branch of elementary learning was so rapid, and his application to study so intense, that his teachers were astonished at the ease and quickness with which he distanced, not only those who were commencing the same class with himself, but those who had the advantage of attending for many sessions before him. His youthful imagination entered with great delight into the beauties of the writings of the ancients, and a taste for classical learning never forsook him during the whole course of his life, notwithstanding the predominant bent of his wonderful genius for the cultivation and improvement of mathematical science. From the time he entered college he kept a diary, in which he carefully noted down the beginning and success of every particular study, inquiry, or investigation, his conversations with learned men, the subjects of those, and the arguments on either side. This was found

among his oldest manuscripts, and in it might be read the names of the celebrated Mr. Robert Simpson, Dr. Johnson, and several other gentlemen of learning and worth, who all seemed anxious who should most encourage our young philosopher, by opening to him their libraries, and admitting him into their most intimate society and friendship. His genius for mathematical learning discovered itself so early as twelve years of age, when, having accidentally met with a copy of *Euclid* in a friend's chamber, he became master in a few days of the first six books without any assistance; and having accomplished this extraordinary enterprise, his predilection for the science of quantity was determined for life. He now made an extraordinary progress, as we very soon after find him engaged in solving the most curious and difficult problems.

At fifteen years of age Mr. Maclaurin took his degree of Master of Arts, having passed through the *curriculum* or public course of lectures appointed by the university, which must be attended before this honour can be gained. The subject he selected for his *thesis* was the "Power of Gravity," and this, according to the custom of the times, it was necessary for him to defend publicly. It may be necessary to observe, for the information of those who are unacquainted with the manner in which such disputations were conducted in Scotland, that the candidate was left free to select for this ordeal any literary or scientific subject he thought proper. The depth and boldness of the topic proposed by young Maclaurin at once revealed what kind of studies had engaged his attention while at the university, and excited the wonder and admiration of all present. In most instances the subjects of disputation were of a trifling kind, and adapted chiefly to afford the candidate an opportunity of displaying his ingenuity and acquaintance with the mood and figure of the school of logic. But the mind of our youthful philosopher disdained to stoop to anything puerile or commonplace, and the sublimity of his subject showed at once the nature of his studies and the depth of his erudition. At that time the philosophy of Newton was comparatively unknown, and even men the most distinguished in science were slow to comprehend the great and important truths it contained. None but those profoundly skilled in geometry could fully comprehend his doctrines, and that of itself excluded many from the study; whilst others were bound in the trammels of the scholastic jargon of Aristotle or the imaginary vortices of Des Cartes. When, therefore, young Maclaurin chose the "Power of Gravity" as the subject of his thesis, it was a presupposition that he was fully acquainted with the fundamental doctrines of Newton's discoveries, and upon this occasion he acquitted himself to the wonder and delight of his auditors. He afterwards illustrated the same subject in a most beautiful manner, in the last two books of his account of the philosophical discoveries of Sir Isaac. There is only one instance more in the whole range of literature, that we are acquainted with, of such extraordinary and precocious talent where a predisposition for mathematical science was anything like so strong, and that is in the person of Pascal—whom Bayle calls the Divine—nearly at the same age, though not exceeding that of our youthful philosopher. He, too, by the force of his irresistible genius, in secret and by stealth, may be said to have invented a system of geometrical science, which, to keep him in ignorance of, his father had sacrificed both fame and fortune. It might be invidious to compare the philosophic acquirements of these great men in after life, further than their mutual fondness for classic literature, in which they both proved themselves

elegant writers. They had both a strong sense of religion on their minds, and to those who have perused their works, their most anxious desire must appear to have been to apply the theoretical propositions which were known, or they themselves had demonstrated, so as to promote the real benefit of mankind.

Maclaurin having made such an extraordinary progress in the study of geometry, and having, with little trouble, conquered difficulties which in general are looked upon as so formidable, passed at once to the higher branches of that science; and, instead of being deterred from exertion by the intricacy of the demonstrations which necessarily met him at every step as he proceeded in the investigation of difficult propositions, his energies seemed to acquire new life and vigour to enable him to surmount every obstacle in his way. Nothing delighted him more than to be engaged in difficult and curious problems; and this much is certain, that in his sixteenth year he had already invented many of the finest propositions afterwards published under the title of *Geometria Organica*.

At the beginning of the session in 1714, immediately subsequent to taking his degree, he entered himself as a student of divinity, but he only attended the college for one year longer, when, becoming disgusted at the dissensions that at that time had crept into the church, he relinquished all ideas of becoming a clergyman, and, happily for science, determined to devote himself to the study of mathematics and philosophy. He quitted the university and retired to his uncle's house, at Kilfinnan, in a sequestered part of the country. That good man having, at all times, acted as a father to him, he determined to wait with patience until some secular employment should occur. In this happy seclusion he continued his favourite researches, still cultivating his mind by a perusal of the best classic authors, for which he had naturally the most refined taste. The sublime scenery amidst which he lived, would, at proper intervals, invite him to wander through the lofty mountains and lonely glens, to consider the numberless natural curiosities with which they abound; and here his fancy being warmed by the grand scenes which presented themselves, he would sometimes break out in an ode, or hymn, on the beauties of nature and the perfection of its Author. Of these, some fragments were preserved by his friends, and although we know not if they were ever published, still they must have possessed considerable interest, as serving to develop the openings and improvements of a mind like that of Maclaurin.

When he was only nineteen years old, in the autumn of 1717, a vacancy occurred in the professorship of mathematics in the Marischal College of Aberdeen. For this he presented himself as a candidate, and carried along with him the most ample testimonials from his friends at Glasgow, where he had distinguished himself so eminently. A very able competitor appeared in the field against him, but after a competition, or comparative trial of excellence, which lasted for ten days, Mr. Maclaurin was declared the successful candidate. Being now fixed in his chair he quickly revived the taste for mathematical learning, and raised it higher than it had ever been in that university. He continued at Aberdeen discharging the duties of his office, and had the happiness to perceive his usefulness increasing, and his popularity as a public professor greatly extended. In the vacations of 1717 and 1719 he went to London, with the view of extending his information, and of being introduced to the illustrious men there. As mathematical knowledge was never in so great re-

quest, nor its professors so much honoured at any period in the history of Britain, his fame had already gone before him; but, independent of that, he was furnished with letters of introduction from Professor Simpson and Dr. Clark to the first philosophers of that or any other age. It was this first journey to London that laid the foundation of his subsequent fortunes in life. Besides Dr. Hoadly, then Bishop of Bangor, Dr. Samuel Clark, and several other eminent men, he became acquainted with Sir Isaac Newton, who not only patronized him as a young man of genius, and possessed of a singular turn of mind for mathematical investigation, but seems to have formed for him a stronger degree of attachment than he was ever known to exhibit towards any one of the numerous candidates for his patronage. This kind preference Mr. Maclaurin ever after considered the greatest honour and happiness of his life. Long before he meditated his journey to London he was an enthusiastic admirer of the philosophy of Newton, and of the almost superhuman genius of its inventor. To him he therefore submitted his treatise on the *Power of Gravity*, which he brought with him in manuscript to London, and on its receiving the sanction of him who had done more to extend the boundaries of mathematical science than almost all mankind, Mr. Maclaurin's triumph was complete. He was admitted a member of the Royal Society when only twenty-one years of age, two of his papers were, about the same time, inserted in the *Transactions* of that learned body, and his book entitled *Geometria Organica* was published with the approbation of their president. In his second journey he became acquainted with Martin Folks, Esq., who succeeded Sir Isaac Newton as president of the Royal Society, and with whom he thenceforth cultivated a most entire and unreserved friendship. This great patron of scientific men frequently corresponded with him, communicating to him all his views and improvements in the sciences, and encouraging him to proceed in his philosophical studies.

In 1722 Lord Polwarth, ambassador from the court of St. James' to the congress of Cambray, had been for some time looking out for a proper person to accompany his son, Mr. Hume, on his travels. His lordship was fond of literature and the company of literary men; he had frequent opportunities of observing Mr. Maclaurin's behaviour, who at this time, from his consummate abilities, was admitted into the highest circles of society in London. His lordship being deeply prepossessed in favour of our youthful philosopher, engaged him as companion and tutor to his son. Maclaurin having procured a proper person to fill his place for a time at the college of Aberdeen, and feeling a strong desire to gratify his curiosity by visiting foreign countries, he accordingly with his friend and scholar set out for France, and proceeded at once to the capital, where they took up their abode. After remaining a short time at Paris they visited several of the chief towns in France, and finally fixed upon Lorraine for their residence. Here they had the advantage of a good academy, besides the introduction to one of the most polite courts in Europe. Mr. Maclaurin had now an opportunity of improving that easy and genteel address which was at all times natural to him, and with his graceful person and great erudition he excited the admiration and gained the esteem of the most distinguished persons of both sexes. Here he wrote his essay on the percussion of bodies, which gained the prize of the Royal Academy of Sciences in 1724. The substance of this tract is inserted in his *Treatise of Fluxions*.

On leaving Lorraine with his pupil on a tour

through the southern provinces of France, and arriving at Montpellier, Mr. Hume was seized with a fever which quickly terminated his life. This dreadful calamity affected Mr. Maclaurin in the deepest manner, and overwhelmed him with grief. In some letters written on that melancholy occasion he seemed almost inconsolable for the loss of his pupil, companion, and friend, and his sympathy with a family to which he owed great obligations, and which had suffered an irreparable loss in the death of this hopeful young nobleman, rendered him unhappy beyond expression. Travelling and all other things being now distasteful, he set out immediately on his return to his profession at Aberdeen.

Having by this time justly earned the distinction of one of the first men of his country, the curators of the university of Edinburgh were desirous of engaging him to supply the place of Mr. James Gregory, whose age and infirmities had rendered him incapable of teaching; but several difficulties retarded the design for some time. A gentleman eminent for mathematical abilities, but whose name is now forgotten, had succeeded in gaining over some of the patrons, who promised him their interest for the appointment, until a recommendatory letter from Sir Isaac Newton completely turned the balance in Mr. Maclaurin's favour. Sir Isaac first addressed Mr. Maclaurin, with allowance to show it to the patrons of the university, and expresses himself as follows:—"I am very glad to hear that you have a prospect of being joined to Mr. James Gregory in the professorship of mathematics at Edinburgh, not only because you are my friend, but principally because of your abilities, you being acquainted as well with the new improvements of mathematics as with the former state of those sciences. I heartily wish you good success, and shall be very glad of hearing of your being elected. I am, with all sincerity, your faithful friend, and most humble servant." In a second letter to the lord-provost of Edinburgh, which Mr. Maclaurin knew nothing of till some years after Sir Isaac's death, he thus writes:—"I am glad to understand that Mr. Maclaurin is in good repute amongst you for his skill in mathematics, for I think he deserves it very well; and to satisfy you that I do not flatter him, and also to encourage him to accept the place of assisting Mr. Gregory, in order to succeed him, I am ready (if you please to give me leave) to contribute twenty pounds per annum towards a provision for him till Mr. Gregory's place becomes void, if I live so long, and I will pay it to his order in London." The town-council, however, with becoming pride, respectfully declined this generous offer, and the business was finally arranged that Mr. Gregory was to retain his salary during life; his family in case of their father's death were secured in it for seven years from the date of Mr. Maclaurin's being inducted as joint professor, who was promised fifty pounds per annum, besides the fees he received from the students attending the class, upon condition of performing all the duties of the office. On the 3d November, 1725, he was introduced to the university, as was at the same time his learned colleague and intimate friend Dr. Alexander Monro, professor of anatomy. The subjects which Mr. Maclaurin introduced into the different courses of lectures on mathematics were very miscellaneous, and the classes soon became unusually numerous, there being upwards of a hundred young gentlemen attending his lectures, who being of different standings and proficiency, he was obliged to divide them into four or five classes, in each of which he employed a full hour every day from the 1st of November to the 1st of June. In the first or lowest class (sometimes divided into two) he taught

the first six books of Euclid's *Elements*, plain trigonometry, practical geometry, the elements of fortification, and an introduction to algebra. The second class repeated the algebra again from its principles, and advanced farther in it, then proceeded to the theory of mensuration of solids, spherical trigonometry, the doctrine of the sphere, dialling, and other practical parts. After this he gave the doctrine of the conic sections, with the theory of gunnery, and concluded with the elements of astronomy and optics. In the third class he went on in astronomy and perspective, prelected on Sir Isaac Newton's *Principia*, and explained the direct and inverse method of fluxions. At a separate hour he began a class of experimental philosophy about the middle of December, which continued thrice every week till the beginning of April, and at proper hours of the night described the constellations and showed the planets by telescopes of various kinds. All Mr. Maclaurin's lectures on these different subjects were given with such perspicuity of method and language, that his demonstrations seldom stood in need of being repeated. Such, however, was his anxiety for the improvement of his scholars, that if at any time he found they could not comprehend his meaning, or if upon examining them he found they could not readily demonstrate the propositions which he had proved, he was apt rather to suspect that his own expressions had been obscure than their want of genius or attention. He therefore would resume the demonstration in some other method, in order to try if, by presenting it in a different light, he could give them a better view of it. Besides the labours of his public profession, he had frequently many other employments and avocations. If an uncommon experiment was said to have been made anywhere, the curious were desirous of having it repeated by Mr. Maclaurin. On all momentous occasions he was the first to be applied to; and if an eclipse or comet was to be observed, his telescopes were always in readiness. Such was the elegance and amenity of his manners that the ladies took the liveliest interest in his experiments and observations, and were delighted and surprised at finding how easily and familiarly he would resolve the questions they put to him; and to those gentlemen who had been his pupils his advice and assistance were never wanting; nor was admittance refused to any except in his teaching hours, which were devoted to that purpose alone. The ingenious of all ranks courted his acquaintance and friendship, and so pressing were they to enjoy the pleasure of his conversation after his usual avocations were over, that he was obliged to take from the ordinary hours of repose what he bestowed on his scholars and friends, and by persevering in deep and severe study he exhausted his strength and greatly impaired his health. About this time, at the beginning of the year 1728, Sir Isaac Newton died, and his nephew, Mr. Conduitt, proposed to publish an account of his life, for which purpose he applied to Mr. Maclaurin for his assistance, who out of gratitude to his great benefactor readily undertook the task, and finished the history of the progress which philosophy had made before Sir Isaac's time. When the first draught of that work was sent up to London it was shown to some eminent judges, and met with their highest approbation. Among the rest Dr. Rundle, afterwards Bishop of Derry, was so pleased with the design that he mentioned it as particularly worthy of the queen's notice, who, after attentively perusing it, was so highly gratified that she expressed a desire to see it published; but Mr. Conduitt's death having prevented the execution of his part of the proposed work, Mr. Maclaurin's manuscript was re-

turned to him. To this he afterwards added the more recent proofs and examples given by himself and others on the subjects treated by Sir Isaac, and left it in the state in which it now appears. Mr. Maclaurin continued to live single till the year 1733, when he married Anne, daughter of Mr. Walter Stewart, solicitor-general for Scotland to George I., by whom he had seven children.

Dr. Buckley, Bishop of Cloyne, having taken occasion from some disputes that had arisen concerning the grounds of the fluxionary method in a treatise entitled the *Analyst*, published in 1734, to explode the method itself, and at the same time to charge mathematicians in general with infidelity in religion, Mr. Maclaurin entered the lists of disputation with him, eager to defend his favourite study and repel an accusation in which he was most unjustly included. He commenced his reply to the bishop's book; but as he entered more deeply into the subject so many discoveries, so many new theories and problems, occurred to him, that, instead of a vindictory pamphlet, his work, when finished, presented a complete system of fluxions, with their application to the most considerable problems in geometry and natural philosophy. This work was published in Edinburgh in 1742, in two volumes quarto, in which we are at a loss what most to admire—his solid, unexceptionable demonstrations of the grounds of the method itself, or its application to such a variety of curious and useful problems. A society had for many years subsisted in Edinburgh for the advancement of medical knowledge; Mr. Maclaurin, on reviewing their plan of proceedings, and not thinking it sufficiently extensive, proposed to take in all parts of physics, together with the antiquities of the country. This was readily agreed to, and Mr. Maclaurin's influence engaged several noblemen and gentlemen of the first rank and character to join themselves for that purpose to the members of the former society. The Earl of Morton did them the honour to accept of the office of president. Dr. Plummer, professor of chemistry, and Mr. Maclaurin were appointed secretaries; and several gentlemen of distinction, English and foreigners, desired to be admitted members. At the monthly meetings of the society Mr. Maclaurin generally read some treatise of his own, or communicated the contents of his letters from foreign parts; by which means the society were informed of every new discovery or improvement in the sciences. Several of the papers read before this society are printed in the fifth and sixth volumes of the *Medical Essays*; some of them are also published in the *Philosophical Transactions*; and Mr. Maclaurin had occasion to insert a great many more in his *Treatise of Fluxions*, and in his account of Sir Isaac Newton's philosophy. He was the first who proposed the building of an astronomical observatory and a convenient school for experiments in the university of Edinburgh, of which he drew an elegant and well-contrived plan; and as this work was to be carried on by private subscription, he used all his influence to raise money for that purpose with so much success, that, had not the rebellion intervened in Scotland, the work would have been speedily completed. The Earl of Morton, on visiting his estates in Orkney and Shetland in 1739, wanted at the same time to settle the geography of these islands, which was very erroneously laid down on all our maps, to examine their natural history, to survey the coasts, and take the measure of a degree of the meridian—and for this purpose he applied to Mr. Maclaurin for his assistance; but his domestic affairs not permitting him to undertake the journey, he drew up a plan of what

he thought necessary to be observed, furnished the proper instruments, and recommended Mr. Short, the celebrated optician, as a fit operator for managing them. The accounts Mr. Maclaurin afterwards received of this voyage made him still more sensible of the erroneous geography we had of those parts, by which so many shipwrecks had been occasioned, and he therefore employed several of his scholars, who were then settled in the northern counties, to survey the coasts.

Mr. Maclaurin had still more extensive views for the improvement of geography and navigation over all the surface of the globe. After carefully perusing all the accounts of voyages, both in the South and North Seas, he was of opinion that the sea was most probably to be found open from Greenland to the South Sea by the North Pole; and when schemes for finding out such a passage were submitted to parliament in 1744, he was consulted concerning them by several persons of high rank and influence; but before he could finish the memorials which he proposed to have sent, the premium was limited to the discovery of a north-west passage, and Mr. Maclaurin used to regret that the word *west* was inserted, because he thought a passage, if at all to be found, must lie not far from the pole. Of this he appeared to be so deeply persuaded that he has been heard to say, if his situation could admit of such adventures, he would gladly undertake the voyage, even at his own cost.

Such was the zeal this amiable and celebrated man evinced on every occasion for the public good: the last and most remarkable instance is that which we shall now relate.

In 1745, when the Highland army had got between Edinburgh and the king's troops, Mr. Maclaurin was the first to rouse the friends of the existing government from their security; and though he was aware that the city was not long defensible, or able to resist even the undisciplined and ill-armed host that was advancing to attack it, yet as he foresaw how much might be gained by the insurgents' possessing themselves of the capital, and the king's forces under Sir John Cope being daily expected, he made plans of the walls, proposed the several trenches, barricades, batteries, and all such defences as he thought could be thrown up before the arrival of the enemy, earnestly hoping that the town might thus hold out till relieved. The whole burden, not only of contriving but also of overseeing the execution of this hasty defence, fell to Mr. Maclaurin's share. He was indefatigable in his exertions, employed both night and day in drawing plans and running from place to place; so that the anxiety, fatigue, and cold to which he was thus exposed, affecting a constitution naturally weak, laid the foundation of the disease of which he died. It is not properly connected with our subject to inquire how Mr. Maclaurin's plans were neglected or defeated, or by what means Prince Charles got possession of Edinburgh; but after defeating the king's troops at Prestonpans, he found himself in such strength as to issue several very arbitrary orders, among which was one commanding all who had been volunteers in the defence of the city, before a stated time, to wait on his secretary, to subscribe a recantation of what they had done, and a promise of submission to the new government, under the pain of being deemed and treated as rebels. Mr. Maclaurin had acted too conspicuous a part as a volunteer, to hope to escape their vengeance if he once fell into their hands; he therefore privately withdrew into England before the last day of receiving the submissions, but not before he contrived means to convey a good telescope into the castle, and to supply the garrison with provisions.

Dr. Thomas Herring, then Archbishop of York, hearing that Mr. Maclaurin had taken refuge in the north of England, invited him in the most friendly manner to reside with him during his stay in that part of the country. Mr. Maclaurin gladly accepted the invitation, and soon after expresses himself thus in a letter to a friend:—"Here," says he, "I live as happily as a man can do who is ignorant of the state of his family, and who sees the ruin of his country." The Archbishop of York, of whose talents and goodness Mr. Maclaurin ever retained the highest veneration, held a frequent correspondence with him; and when it was suspected that the rebels might again enter Edinburgh on their retreat from England, he invited his former guest, for ease and security, to his hospitable mansion. While at York it was remarked that Mr. Maclaurin appeared more than usually meagre and sickly; but he at that time, feeling no apprehension of danger, did not consider it necessary to call in medical aid. Having fallen from his horse, however, on his journey southward, and when the Pretender's army entered England, having, on his return home, been exposed to excessive cold and tempestuous weather, he complained upon his arrival of being seriously indisposed. His disease was soon discovered to be a dropsy in the abdomen, to remove which a variety of medicines were prescribed by the most eminent physicians of the day, and three tapings were resorted to, with little or no effect. While suffering under this painful malady, his behaviour was such as became a philosopher and Christian; calm, cheerful, and resigned; retaining his senses and judgment in their full vigour till within a few hours of his death. Then, for the first time, while engaged in dictating to his amanuensis the last part of the last chapter of his *Account of Sir Isaac Newton's Discoveries*, in which he proves the goodness of God, his amanuensis perceived him to falter. Dr. Monro came in shortly afterwards, and he conversed with him after his accustomed manner, and requested him to account for flashes of fire, as it were, darting from his eyes, though his sight was gradually decaying, so that he could scarcely distinguish one object from another. His hands and feet were already cold, and no pulse could be traced in any part of his body. In a short time he desired to be laid upon his bed, where he breathed his last, on the 14th June, 1746, aged forty-eight years and four months. His wife, two sons, and three daughters, survived him. John, the eldest son, studied the law, and after making a distinguished figure at the bar, was promoted to the bench, 17th January, 1789, under the designation of Lord Dreghorn. He was an excellent scholar, and erected a monument to his father in the Grayfriars' Churchyard, with an inscription which has often been quoted for its simple and expressive eloquence. Lord Dreghorn also published various pieces in prose and verse, which in their day enjoyed some reputation, and have been oftener than once printed.

Colin Maclaurin was not only distinguished by his great genius and learning, but by the qualities of his heart, his universal benevolence, and unaffected piety. Dr. Monro, in an oration spoken at the first meeting of the university after his death (from which much of the foregoing account is taken), draws a sublime and affecting picture of his friend's great qualities, and professes that, after an intimacy with him for so many years, he had but half known his worth, which only disclosed itself in its full lustre when it came to suffer the severe test of that distressful situation in which every man must at last find himself, and which only minds prepared like his, armed with virtue, can bear with dignity.

If we look back upon the numerous writings of

Mr. Maclaurin, and the deep researches he had been engaged in, his patience and assiduity will be equally astonishing with his genius. His favourite studies were mathematics, which he cultivated with wonderful success, influenced by a disinterested love of truth, and aiming constantly at improvement and utility. The further he advanced in the knowledge of geometry and of nature, the greater his aversion grew to perfect systems, hypotheses, and dogmatizing. Without being dissatisfied with the attainments we can arrive at, or the uses which they serve, he saw that there lay infinitely more beyond our reach, and used to call our highest discoveries but a dawn of knowledge, suited to our circumstances and wants in life, in which, however, we ought thankfully to acquiesce for the present, in hopes that it will be improved in a happier and more perfect state. To a view of general utility all his studies were accommodated; and we find in many places of his works an application even of the most abstruse theories to the perfecting of mechanical arts. He had resolved for the same purpose to compose a course of practical mathematics, and to rescue several branches of the science from the bad treatment which they often meet with in less skilful hands. But all those designs were frustrated by his death, unless we may reckon as a part of his intended work the translation of Dr. David Gregory's *Practical Geometry*, which he revised and published, with additions, in the year 1745. In his lifetime, however, he often had the pleasure to serve his friends and country by his superior skill. Whatever difficulty occurred concerning the construction or perfecting of machines, the working of mines, the improvement of manufactures, the conveying of water, or the execution of any public work, Mr. Maclaurin was at hand to resolve it. He was likewise employed to terminate some disputes of consequence that had arisen at Glasgow concerning the gauging of vessels; and for that purpose presented to the commissioners of excise two memorials containing rules (by which the officers afterwards acted), with their demonstrations. But what must have given his philanthropic mind a higher source of pleasure than anything else of the kind, were the calculations he made relative to that wise and humane provision which is established by law for the children and widows of the Scottish clergy, and of the professors in the universities, entitling them to certain annuities and sums upon the voluntary annual payment of a certain sum by the incumbent. On the contrivance and adjustment of this scheme Mr. Maclaurin bestowed great labour, and contributed not a little to bring it to perfection.

To find that his knowledge rendered him thus eminently useful to a late posterity must have been a delightful enjoyment. But what still more endeared his studies to him was the use they were of in demonstrating the being and attributes of the almighty Creator, and establishing the principles of natural religion on a solid foundation, equally secure against the idle sophistry of Epicureans and the dangerous refinements of modern metaphysicians. To this use Mr. Maclaurin frequently applied them; and he was equally zealous in the defence of revealed religion, which he would warmly undertake, whenever he found it attacked, either in conversation or writing. How firm his own persuasion of its truth was, appears from the support which it afforded him in his last hours.

Among Mr. Maclaurin's productions, besides the articles already specified, was a paper sent to the Royal Academy of Sciences at Paris, in the year 1740, on account of which he shared the prize of the Academy with the celebrated D. Bernouilli and

Euler, for resolving the problems relating to the motion of the tides from the theory of gravity—a question which had been given out during the former year without receiving any solution. Having only ten days in which to draw up this paper, he had not leisure to transcribe a fair copy of it; so that the Paris edition of it is incorrect. Afterwards, however, he revised the whole and inserted it in his *Treatise of Fluxions*. His contributions to the *Philosophical Transactions* may be seen in different volumes of these collections, from No. 30 to No. 42, both inclusive, and treat on the following subjects:—"Of the Construction and Measure of Curves,"—"A New Method of Describing all Kinds of Curves,"—"On Equations with Impossible Roots,"—"On the Description of Curves; with an Account of further Improvements, &c."—"An Account of the Annular Eclipse of the Sun at Edinburgh, January 27, 1742-3,"—"A Rule for finding the Meridional Parts of a Spheroid, with the same exactness as of a Sphere,"—and "Of the Bases of the Cells wherein the Bees deposit their Honey." These papers conclude the list of our author's writings which were published during his lifetime. After his death the friends to whose judgment he submitted the disposal of his MSS., gave directions for publishing his *Treatise of Algebra*, and his *Account of Sir Isaac Newton's Philosophical Discoveries*. The first of these works, which appeared in 1748, though it had not the advantage to be finished by his own hands, is yet allowed to be excellent in its kind; containing in one volume octavo, of a moderate size, a complete elementary treatise of the science of algebra, as far as it had been hitherto carried. Subjoined to it by way of appendix is a Latin tract, "*De Linearum Geometricarum Proprietatibus Generalibus*," which appears to have been, in our author's judgment, one of the best of his performances, and in which he employed some of the latest hours that he could give to such studies, revising it for the press as his last legacy to the sciences and the public.

MACNEIL, HECTOR, a poet and miscellaneous writer, was born at Rosebank, near Roslin, in the year 1746. His father had been in the army, where he was patronized by the Duke of Argyle, and had mingled in the best company; but, having offended his patron by selling out without his advice, he was left afterwards to his own resources. He took a farm at Rosebank; but some imprudences, and the habit of living in a style above his income, completely ruined his prospects. As his family was then large, it became necessary that the sons should, as soon as possible, be made independent of him. The only expectation for Hector was from a cousin, who carried on a mercantile concern in Bristol. The father, therefore, confined his education to the mercantile branches, dreading from his own example the effect of more refined and classical instruction. The youth discovered excellent parts, with an elegance of taste which seemed to mark him for a different destination from that intended. At the age of eleven he had written a species of drama, in imitation of Gay. His master earnestly entreated to be allowed to give him some of the higher branches; but on this his father put a decided negative. The attachment, however, of the teacher to his pupil, induced him to impart secretly some elements of this forbidden knowledge. From the father, meantime, young Macneil received many anecdotes of the world, and was taught to cherish a high sense of honour and the feelings of a gentleman.

As soon as he had completed his fourteenth year, he was sent off to his cousin at Bristol. On his way

he spent some months at Glasgow, where he completed himself in several branches of his education. His cousin was a rough, boisterous, West India captain, who could not estimate the genius of Macneil, but was pleased with some instances of his spirit. He first proposed to Hector an expedition in a slave-ship to the coast of Guinea; but was diverted from it by some female friends, who rightly judged this destination wholly unsuited to the youth's disposition. He was therefore sent on a voyage to St. Christopher's, with the view of making the sea his profession, if he liked it; otherwise, he was furnished with an introduction to a mercantile house. On his arrival, being completely disgusted with the sea, he hesitated not in accepting the latter alternative. It is probably to this period of his life that we are to fix an event of a singular nature which is stated to have entirely altered his prospects in life. His master had married a lady much younger than himself, and of great personal attractions; and young Macneil was upon terms of equal intimacy with both. One day, while he was sitting upon a garden-chair with the lady, and reading with her from the same book, the ardent feelings of one-and-twenty prompted him to express his admiration of her beauty, by snatching a kiss. It proved the knell of his departing fortune. Notwithstanding his instant penitence, and entreaties for forgiveness, the lady conceived it necessary to inform her husband of what had happened; and the immediate consequence was, the dismissal of Macneil, and a termination to the prospects that were brightening around him. He continued for many years in the West Indies, but does not appear to have ever after known what could be called prosperity. At one time, if not during the whole remaining period of his residence in those colonies, this hapless bard had to stoop to the ungenial employment of a negro-driver. While in this situation he became a strenuous advocate for the system of West India slavery, and wrote a pamphlet in its defence. The only thing which he allowed to be necessary to make the condition of slavery agreeable, was an improvement in the moral conduct of the masters: a subsequent age has seen slavery brought to an end before this improvement was accomplished.

When above forty years of age Macneil returned to Scotland, in a wretched state of health, and without having earned even a moderate independence. In these circumstances, notwithstanding that he had many good connections, and still preserved the feelings of a gentleman and a poet, his situation was of a truly deplorable kind. He nevertheless began to exercise the intellectual faculties, which though so early displayed, had been kept in a kind of abeyance during the intervening period of his life. In 1789 he published *The Harp, a Legendary Tale*, which brought him into some notice in the literary circles. In 1795 appeared his principal poetical composition, "*Scotland's Skaithe, or the History o' Will and Jean; over True a Tale*;" followed next year by a sequel, entitled the "*Waes o' War*." Its excellent intention and tendency, with the strokes of sweet and beautiful pathos with which it abounds, render this one of the most admired productions of the Doric muse of Scotland. Except for a simplicity, occasionally degenerating into baldness, which characterizes this as well as other productions of Macneil, *Will and Jean* might safely be compared with the happiest efforts of any other Scottish poet. The enchanting influence of village potations and politics—the deterioration of a worthy rustic character by such means—the consequent despair and degradation of an originally amiable wife—besides the distresses of the Flemish campaign of 1793, and the subsequent restoration of

the ruined family to partial comfort, are all delineated in most masterly style. About the same time Macneil produced the *Links of Forth; or a Parting Peep at the Carse of Stirling*. This is a descriptive poem; but, though not devoid of merit, it is more laboured and less pleasing. He wrote also a number of songs, some of which possess much pathos and delicacy of sentiment. Not being able, however, to find any means of providing a subsistence, necessity compelled him to seek again the burning climate of the West Indies. After a residence there of only a year and a half, Mr. Graham, an intimate friend, died, and left him an annuity of £100, with which he immediately returned to Edinburgh, to enjoy, with this humble independence, the sweets of literary leisure and society. His reputation and manners procured him ready admittance into the most respectable circles; he enjoyed particularly the intimacy of Mrs. Hamilton, authoress of the *Cottagers of Glenburnie* and other esteemed works of fancy. He was then a tall, fine-looking old man, with a very sallow complexion, and a dignified and somewhat austere expression of countenance. His conversation was graceful and agreeable, seasoned with a somewhat lively and poignant satire. Having probably found in his own case, that devotion to the Muses did not tend to promote his success in life, he gave no encouragement to it in others, and earnestly exhorted all who wrote poetry that appeared to him at all middling, to betake themselves to some more substantial occupation. In 1800 he published, anonymously, a novel, or the first part of one, entitled the *Memoirs of Charles Macpherson*, which is understood to contain a pretty accurate account of the early part of his own life. In 1801 his poetical works were collected into two volumes, foolscap 8vo, and passed through several editions. In 1809 he published the *Pastoral or Lyric Muse of Scotland*, in 4to, a work which did not draw much attention. About the same time he published, anonymously, *Town Fashions, or Modern Manners Delineated*; and also, *By-gone Times, and Late-come Changes*. These pieces, like almost everything he wrote, had a moral object; but the present one was tinctured with his feelings as an old man. It appeared to him that all the changes which had taken place in society, the increase of luxury, even the diffusion of knowledge, were manifest corruptions; and all his anxiety was to inspire a taste for the old style of living. Wishing to suit the style to the matter, he affected a very homely phraseology; and as this was not natural to him, he overdid it, and disgusted rather than persuaded. Yet he clung very fondly to these bantlings of his old age, and even rated them higher than the more elegant productions of his earlier life. Their only real beauty, though he was insensible of it, consisted in a few pathetic passages. Our author also wrote, with the same views, and too much in the same style, a novel, entitled the *Scottish Adventurers, or the Way to Rise*, 2 vols. 8vo, 1812. Throughout the earlier years of the century, he contributed many minor pieces, in prose and verse, to the *Scots Magazine*, of which he was at one time editor.

After a long life of penury, aggravated by ill health, Mr. Macneil died of jaundice, March 15, 1818, not leaving behind him wherewithal to defray his funeral expenses.

MACNISH, ROBERT, LL.D. This physician, philosopher, poet, and miscellaneous writer, was born in Henderson's Court, Jamaica Street, Glasgow, on the 15th of February, 1802. As his father and grandfather were both of the medical profession, it

was resolved that Robert should be devoted to the same course; and with this view his education was conducted, first at the private schools of Glasgow and Hamilton, and afterwards at the university of his native city. At the age of eighteen, having passed his examination before the College of Surgeons, he obtained the degree of *Magister Chirurgie* from the college of Glasgow. Being thus qualified to commence the duties of his profession, he went as assistant of Dr. Henderson of Clyth, to Caithness, where he endured for eighteen months the labour of professional visiting over a wide and wild circuit of country. Although he lost his health under such labour, so that at last he was glad to escape to the more genial region of his native city, he seems to have pursued in the Highlands, and with success, those poetical and literary studies from which his after-life derived its chief distinction. Here, also, influenced no doubt by the bleak and scowling scenery, he wandered in thought among the lands of the sun and their scenes of enchantment, by way of pleasing contrast, until he composed the greater part of a poetical tale, of which the locality was an Armida garden at the foot of the Himalaya Mountains, and the actors, Pharem, a mighty Indian magician, and Ima, daughter of the Khan of Shiraz. Besides this lucubration, which he no doubt found beyond his powers to finish, the young dreamer had already tried his strength in authorship in the columns of the *Fuvernus Journal*. The chief of these contributions was "The Tale of Eivor, a Scandinavian Legend," and the "Harp of Salem," a lament over fallen Jerusalem.

On returning from Caithness to Glasgow, Macnish made a journey to Paris, where he resided a year, for the double purpose of recruiting his constitution and continuing his medical education. In the French capital, among other opportunities of improving his taste, he frequented the Louvre, while its vast collection of the treasures of art, the spoils of conquered nations, were as yet unreclaimed; and here he learned to appreciate the beauties of painting and sculpture, without expressing his emotions in that artistic phraseology which is too often the cloak of ignorant pretension. But of all places in Paris, the cemetery of Père-la-Chaise, that city of the dead, became his favourite resort; and it was there that, in all likelihood, he increased that love of strange musing and mysticism which he had commenced in Caithness and among the second-sighted Highlanders. On coming home he became assistant to his father, and completed his medical education at the university of Glasgow, where he took out his diploma of surgeon in 1825. His thesis which he delivered on this occasion, was an essay on the Anatomy of Drunkenness, which he afterwards expanded into his well-known work of the same title.

Before this period, however, Macnish had written articles, both in prose and verse, for the *Literary Mlange*, and for the *Emmet*, periodicals of the Glasgow press. In 1822 also he sent two productions to Constable's *Edinburgh Magazine*, the one entitled *Macvarich the Murderer*, and the other the *Dream Confirmed*. Both were incidents which he had learned in the Highlands, and expanded into regular stories. But in 1825 a more popular and lasting field was opened to him in *Blackwood's Magazine*, of which he afterwards became one of the most distinguished contributors. His first contribution to this periodical was his tale entitled the *Metempsychosis*; and he was encouraged to persevere from its being published in the monthly number as the leading article. This was no small distinction; for it will be remembered by the admirers of this most famed

of magazines, that at the period we mention it was in no want of highly talented correspondents. During the same year were inserted his *Man with the Nose*, and the *Barber of Gottingen*; and in the following the *Adventures of Colonel O'Shaughnessy*, and *Who Can it Be?* articles whose classical style, and rich, racy, original humour, arrested the attention of *Ebony's* readers, who at this time might well be called the reading public, and raised the question of loud and general interest, Who is this "Modern Pythagorean?" the title under which his contributions were published. In 1827, while Macnish was employed in these fugitive but important literary avocations, he was introduced by Mr. Blackwood to Dr. Moir, ever after his fast friend, who loved him like a brother, and lived to commemorate his worth.

It was not only in prose but in verse that Macnish excelled, and had he devoted himself to the Delilah of poetry, we doubt not that he would have been still more highly distinguished in this department of intellectual excellence than he was as a prose writer of essays and tales. But already the field of the Muses had been so overtrodden and bemired, that the best of our bards had escaped from it into the more ample and diversified regions of prose—Scott, Coleridge, Southey, and Moore, who were a-weary of having their kibes trode upon and grazed by the eager ambitious toes of awkward followers and imitators. Macnish, however, had been wont to express his deeper feelings in verse; and an event in 1827 called from him more than one mournful lyric of domestic sorrow. This was the death of his youngest sister, Christian, a child only ten years old, who was drowned on the banks of the Clyde near Glasgow, while crossing a plank laid athwart a small arm of the river.

The life of a man who devotes himself to the settled profession of a physician, and the peaceful occupations of authorship, presents few materials for the biographer. As a physician indeed we have little to say of Macnish, except that his career in this capacity was of even tenor, and was attended with a fair proportion of profit and success in his native city of Glasgow. In his literary capacity every moment of spare time seems to have been fully occupied; and the articles which he contributed, both in prose and verse, not only to *Blackwood's Magazine*, but also to Frazer's, and other less distinguished periodicals, obtained a prominent place in that species of light literature, and made the good folks of Glasgow justly proud of their fellow-citizen. These productions it is the less necessary to particularize, as they have been published in a compact volume under the editorship of his biographer, Delta. It may be merely mentioned in passing, that they are all more or less distinguished by a lively creative fancy, and chaste subdued classical style, reminding us more of the best writers of the Addison and Goldsmith periods, than the slashing, *outré*, and abrupt, though sparkling, tales and essays that form the staple of our modern periodical writing. Among the happiest of these attempts of Macnish, we may particularly specify the *Metempsychosis*, an *Execution at Paris*, a *Night near Monte Video*, and a *Vision of Robert Bruce*. Still Macnish might soon have been forgot by the magazine-reading public, had he not established his literary reputation upon a more secure basis; and it is by his *Anatomy of Drunkenness*, and *Philosophy of Sleep*, two able and substantial treatises, and his *Book of Aphorisms*, that he is now best known and estimated.

The first of these works, which Macnish commenced before he had reached the age of twenty, and during his toilsome sojourn in Caithness, was the

fruit of much reading and research, aided perhaps occasionally by the practical illustrations which he witnessed among the inhabitants of that whisky-smuggling county. Afterwards he matured it into a thesis, which he read before the Medical Faculty in 1825, when he took out his degree, and published it in 1827 in a thin octavo of fifty-six pages. The subject was comparatively an untrodden field, as hitherto the vice of drunkenness had been rather analyzed by the divine and moralist, than anatomized by the surgeon. The novelty of such a work, and the felicity of his style and mode of illustration, excited a deeper interest among the readers than generally falls to theses, the most neglected of all literary productions, so that Macnish was encouraged to prosecute his inquiries. The result was, that the subject grew and improved upon his hands, while each edition was more popular than its predecessor, until in 1834 a fifth edition of the *Anatomy of Drunkenness* was published by its author. Such success upon so unpromising a theme was one of those triumphs which only true genius can accomplish. In this treatise he contemplates the vice in its physiological character, and writes like a learned physician on its origin, growth, and effects upon the constitution. He then expatiates upon its moral character, and illustrates with fearful power, but yet with the utmost patience and gentleness, the influence of this pernicious habit upon the intellectual and moral organization of its victim. And finally, knowing that all this is not enough, and that people will get drunk in spite of every dissuasive, he shows them in what way this crime may be committed in its least odious form, and with the smallest harm, upon the same benevolent principle that he would have applied the stomach-pump to those who had refused to be benefited either by his warnings or instructions. His next work, the *Philosophy of Sleep*, although of a more metaphysical character, fully sustained the reputation which his *Anatomy* had acquired, and rapidly passed into a second edition. These works not only obtained a wide popularity both in Scotland and England, but in America, where they were republished; they were also translated into the French and German languages, an honour exclusively accorded to philosophical treatises that possess unquestionable merit.

In 1833 Macnish published his *Book of Aphorisms*. This little work, which is now almost forgotten, consisted of some fifty dozen fag-ends and quaint remarks, in the fashion of Rochefoucault, or rather of Lord Bacon, but without pretending to soar to the eminence of these illustrious models. It was thought, however, a clever work in its day, among the circle to which it was limited. Another literary task which he executed was an *Introduction to Phrenology*, which he published in 1835. A second edition of this volume, which he had carefully prepared for publication, appeared two years after—but by this time Macnish had finished his appointed round of labour, and was beyond the reach of criticism; and this event, as well as a just appreciation of his character, was so well expressed in the *Phrenological Journal*, in giving a review of the work itself, that we cannot refrain from quoting it as a fitting close to this brief narrative:—

“This work appears breathing with life, spirit, and observation, as if its author were himself ushering it into the world. There is no indication within it, or announcement about it, that would lead the reader to believe that the mind which had conceived it had fled, and that the hand which had written it was cold in death; yet such are the facts! The work was just completed, and the last sheets of the appendix prepared for the press, when, in the

beginning of January, 1837, the gifted author was seized with influenza, which speedily degenerated into typhus fever, and on the fourteenth day after the attack he died. One of the distinguishing characteristics of Mr. Macnish's mind was vivacity. Whether he gave way to ridicule and sarcasm, of which he was a master—or to fancy, with which he was brilliantly endowed—or to tenderness and affection, which he felt strongly and could touchingly express—there was always a spring of life about him that vivified his pages, and animated and delighted his readers. This quality abounds in every page of the present work, and invests it with a new and extraordinary interest, when we regard it as the last words of a talented intellect now in the grave.”

MACPHERSON, JAMES, a literary character of celebrity, was born at Ruthven, in the county of Inverness, in the latter end of the year 1738. His family was one of the most ancient in that part of the country, and of high respectability. The earlier rudiments of education he received at home, and afterwards he was sent to the grammar-school of Inverness. At this period he began to discover a degree of talent which induced his family, contrary to their original intention, to bring him up to a learned profession. With this view he was sent, after completing an initiatory course at Inverness, to the university of Aberdeen, and afterwards to that of Edinburgh, where he finished his studies.

Young Macpherson had already begun to exercise his poetical talents; and, while at the university, gave some specimens of his powers in that department of literature, but with very indifferent success. Hitherto, however, he had confined his muse to such short and desultory flights as young men of poetical temperament usually begin with; but, in 1758, he made a bolder essay, by producing a poem in six cantos, entitled the *Highlander*. This work was printed at Edinburgh, in 12mo, in the year above named. Though not without some excellences, the *Highlander*, as a whole, is an exceedingly poor production, and must be considered so, even with every allowance for the youth of its author, who was yet only in the twentieth year of his age. The public was of a similar opinion with regard to its merits, and it almost instantly sank into oblivion. It must, however, be recorded, to the credit of the poet, that he very soon became sensible of its defects and deficiencies, and made every endeavour to suppress it. About this time, also, he wrote an ode on the arrival of the earl-marischal in Scotland, which he entitled “an attempt in the manner of Pindar.” This ode, though it certainly does not possess much poetical merit, is yet, on the whole, considerably above mediocrity. From this period there is no more heard of Macpherson's poetical compositions, until he appeared as the translator of those singular poems on which his celebrity is founded.

It was intended by his friends that he should, on completing his studies, enter the church; but it is not certainly known whether he ever actually did take orders or not. He is, however, spoken of about this time (1760) as a “young clergyman;” and is described by Hume, the celebrated historian, as “a modest, sensible young man, not settled in any living, but employed as a private tutor in Mr. Graham of Balgowan's family; a way of life which he is not fond of.” The notice of Mr. Hume was thus directed to Macpherson, in consequence of the appearance of a work bearing the title of “*Fragments of Ancient Poetry*, collected in the Highlands of Scotland, and translated from the Gaelic or Erse Language,” the production of Macpherson, and the first presentation

of that literary novelty which was afterwards to attract so large a portion of the world's notice, and to excite so much discussion and dissension in its literary circles.

The *Fragments* were declared to be genuine remains of ancient Celtic poetry; and were, as well from that circumstance as their own intrinsic merit, received with the utmost enthusiasm and delight. Every one read them, and every one admired them; and, altogether, a sensation was created in the world of letters which it had known but on few occasions before. As it was intimated that other specimens of this ancient poetry might be recovered, a subscription was immediately begun, to enable Macpherson to quit his employment as a family preceptor, and to undertake a mission into the Highlands to secure them. With the wishes of his patrons on this occasion, the principal of whom were Dr. Blair, Dr. Robertson, Dr. Carlyle, and Mr. Hume, Macpherson readily complied, and lost no time in proceeding in quest of more "fragments," having been furnished previously to his setting out with various letters of recommendation and introduction from the influential persons just named to gentlemen resident in the Highlands.

After making an extensive tour through the mainland and isles, he returned to Edinburgh, and in 1762 presented to the world the first portion of the results, real or pretended, of his mission. This was "*Fingal*, an ancient Epic Poem in six books; together with several other Poems, composed by Ossian, the Son of Fingal: translated from the Gaelic," 4to. These poems were received with equal, if not yet greater applause, than that which had hailed the first specimen Macpherson had given of Celtic poetry. The demand for the work was immense, and the fame of the translator and saviour, as he was deemed, of these presumed relics of ancient literature was rapidly spread, not only over Britain, but over all Europe. They were almost immediately translated into nearly every language spoken on the Continent; and in each of these translations, Macpherson was alluded to in terms "that might," as he himself says, "flatter the vanity of one fond of fame,"—a circumstance which must have been highly gratifying to him, for he was fond of fame, even inordinately so, and was known to have been under the influence of a violent passion for literary repute from a very early period of his life.

In the following year, viz. 1763, the poem of *Fingal*, &c., was succeeded by "*Temora*, in eight books, with other Poems, by Ossian," 4to. This was also well received, but scarcely with the same degree of enthusiasm which had marked the reception of the preceding poems. A change had taken place both with regard to Macpherson himself personally and his poetry. A suspicion as to the authenticity of the latter was now beginning to steal over the public mind; and the former, from being a modest man, as he was represented to be by Mr. Hume, had become insolent and arrogant. Whether this last was the result of the operation of extraordinary success on an ill-regulated mind, or the effect of frequent irritation from the attacks of the sceptical, to which Macpherson was now certainly subjected, it would not perhaps be easy to determine. It probably arose partly from both. The likelihood that the latter consideration had, at any rate, some share in producing this change of demeanour is considerable, when the nature of Macpherson's disposition, which was ardent, haughty, impatient, and irascible, is taken into account. That such a change, however, had taken place, is certain; and the circumstance derives no little interest from the person

by whom, and the manner in which, it is marked. "You must not mind," says Mr. Hume, in a letter to Dr. Blair on the subject of the poems of Ossian, "so strange and heteroclitie a mortal (Macpherson), than whom I have scarce ever known a man more perverse and unamiable." This was Mr. Hume's opinion of him in 1763; and it will be remarked how oddly it contrasts with that which he expressed regarding him in 1760. That Mr. Hume, however, saw sufficient reason in Macpherson's conduct thus to alter his opinion of him, no man can doubt who knows anything of the character of the illustrious historian, himself one of the most amiable of men.

In 1764, the year following that in which *Temora* appeared, Macpherson obtained the appointment of secretary to Governor Johnstone, then about to set out for the settlement of Pensacola, of which he was made chief. After a short residence in the colony, during which he had assisted in the construction and arrangement of its civil government, a difference arose between Macpherson and the governor, and they parted. The former left the settlement, visited several of the West India islands and some provinces of North America, and finally returned to England in 1766.

He now took up his residence in London, and shortly after resumed his literary pursuits; these, however, as the Ossianic poems were now exhausted, were of an entirely different nature from those which had hitherto employed him. His first public appearance again as an author was in 1771, when he produced a work, entitled *An Introduction to the History of Great Britain and Ireland*, 4to. This work, he says himself, he composed merely for private amusement. Whatever were the incitements which led to its production, necessity, at any rate, could not have been amongst the number; for Macpherson, if not already comparatively wealthy, was rapidly becoming so by the extensive sale of the poems. Whether written, however, for amusement, or with a view to fame, the author of the *Introduction* had no reason to congratulate himself on the result of its publication. Both the book and the writer were attacked from various quarters with much bitterness of invective, and a controversy regarding its merits and the opinions it promulgated, arose, which was but little calculated to improve the irritable temper of its author, or to add to his happiness. Nor was this treatment compensated by any success to the work itself. It made a sufficient noise; but yielded neither fame nor profit. The former was the result of its author's celebrity; the latter, it is to be feared, of his incapacity.

In an evil hour for his literary reputation Macpherson, with more confidence than wisdom, began a translation of the *Iliad* of Homer. This work he completed, and gave to the world in 1773. Its reception was mortifying in the extreme. Men of learning laughed at it, critics abused it; and, notwithstanding some strenuous efforts on the part of his friends, particularly Sir John Elliot, it finally sank under one universal shout of execration and contempt. The finishing blow to this production was inflicted by the *Critical Review*, in which it was ably and fatally criticized.

"There is nothing," says one of the most able and elegant of Macpherson's commentators, Dr. Graham, the late learned minister of Aberfoyle, "there is nothing which serves to set Macpherson's character and powers in a stronger light than his egregious attempt to render the great father of poetry into prose, however natural it might have been for him to have made this attempt after his success in doing the same office to Ossian." The temerity of this

attempt will not be deemed a little enhanced by the consideration that Pope's elegant translation was already before the world; nor will the awkwardness of its failure be thought lessened by a recollection of the sentiment its author himself expressed on another occasion, viz. that he "would not deign to translate what he could not imitate, or even equal." This unguarded language was now recollected to his prejudice, and carefully employed by his enemies to increase the disgrace of his failure.

To add to the literary mortifications under which Macpherson was now suffering, he found himself attacked by Dr. Johnson in his celebrated *Tour to the Hebrides*, published in 1773, on the subject of the authenticity of his translations of Ossian. The remarks of the great moralist, as is well known, are not confined, in this case, to an abstract discussion of the question, but include some severe, though certainly not unmerited, personal reflections on the translator. These the latter resented so highly that he immediately wrote a threatening letter to their author, who replied in spirited and still more severe and sarcastic language than he had employed in his published strictures, saying, amongst other humiliating things, "Your abilities since your Homer are not so formidable." To this letter Macpherson wisely made no reply, and is not known to have taken any further notice of it than by assisting M^r Nicol in his *Remarks on Dr. Johnson's Tour*, printed in 1774. Even of this, however, he is only suspected, there being no positive proof that he actually had any share in that production.

Although thus thanklessly acknowledged, Macpherson still continued his literary labours, and in 1775 published "*The History of Great Britain*, from the Restoration to the Accession of the House of Hanover," in 2 vols. 4to.

Soon after the publication of this work another favourable change took place in the fortunes of its author, and opened up to him a new source of emolument. He was selected by the government, at this time embarrassed by the resistance of the American colonies to its authority, to defend and give force to the reasons which influenced its proceedings with regard to that country. In the discharge of this duty he wrote a pamphlet entitled *The Rights of Great Britain Asserted against the Claims of the Colonies*, 8vo, 1776. This pamphlet was circulated with great industry, and ran through several editions. He also wrote *A Short History of the Opposition during the Last Session of Parliament*, 8vo, 1779. The merit of this last production was so remarkable, that it was at the time generally ascribed to the pen of Gibbon, a compliment which, however, it is very questionable if its real author appreciated.

About this period Macpherson's good fortune was still further increased by his being appointed agent to the Nabob of Arcot, in behalf of whom he made several effective appeals to the public, and amongst others published "*Letters from Mahommed Ali Chan, Nabob of Arcot, to the Court of Directors*." To which is annexed a State of Facts relative to Tanjore, with an Appendix of Original Papers," 4to, 1777. He is also supposed to have been the author of "*The History and Management of the East India Company*, from its Origin in 1600 to the Present Times; vol. i. containing the Affairs of the Carnatic, in which the Rights of the Nabob are explained, and the Injustice of the Company proved," 4to, 1779.

It was now thought advisable that Macpherson, in capacity of agent to the nabob, should be provided with a seat in parliament, and he was accordingly returned member for Camelford in 1780, and was re-elected for the same place in 1784 and 1790. He,

however, never made any attempt to speak in the house; so that the cause of the eastern potentate, whatever it may have gained from his influence abstractly as a member of parliament, was nothing forwarded by his oratory. The period, however, was rapidly approaching when this and all other earthly matters were no longer to be of any concernment to him. His health now began gradually to fail, and continued to decline till the year 1796, when he became so seriously ill that it was thought advisable, as all other means were found unavailing, that he should return to his native country, and try the effect of a change of air. He accordingly proceeded to Scotland, but died in the same year, on the 17th February, at his seat of Bellville in the shire of Inverness, in the fifty-eighth year of his age.

Macpherson died in opulent circumstances, leaving by his will, dated June, 1793, legacies and annuities to various persons to a large amount. Amongst his other bequests there is one of particular interest from its connection with the celebrated works to which he owes his celebrity, and from its bearing on a circumstance which created one of the most memorable civil wars in the literary world upon record—the question of the authenticity of Ossian's poems. This bequest comprised the sum of £1000, payable to John Mackenzie of Fig-tree Court in the Temple, to defray the expense of printing and publishing Ossian in the original. Macpherson also directed by his will that the sum of £300 should be expended in erecting a monument to his memory in some conspicuous situation at Bellville, and that his body should be carried to London and be interred in Westminster Abbey. This was complied with, and he was buried in Poets' Corner.

The preceding sketch, brief as it is, comprehends nearly all of any interest with which the life of Macpherson presents us, and affords in that brevity another instance of the utter disproportion which is so often found to exist between the bulk of a man's personal history and that of his fame—how much may be afforded in one and the same life to the essayist, philosopher, or moralist, and how little to the biographer.

One point of interest in Macpherson's life, however, and without some allusion to which any account of it would be incomplete, has been hitherto left all but untouched in this sketch, and that purposely; as it was thought better to give it a distinct and separate place at the conclusion than to interrupt the biographical narrative by its earlier introduction. The circumstance alluded to is the celebrated controversy regarding the authenticity of Macpherson's translations of the poems of Ossian—a controversy which, whether its voluminous amount is considered, the extremely opposite and conflicting testimony by which it is supported, or the various and widely-scattered members of which it is composed, cannot be approached without hesitation. The fervour with which it was once attended has long since altogether disappeared, and but little now remains even of the interest with which the mooted point was associated. Few, in short, now care anything at all about the matter, and even though it were desirable, it would be impossible to resuscitate the intense feeling with which it was once contemplated. This apathy, however, singularly contrasts with the violent commotion and furious zeal which the discussion of the momentous question excited in the public mind some seventy or eighty years since. It was then a universal topic of conversation in private circles, while the literary arena was crowded with combatants eager for the contest, and inspired, if their feelings may be judged by their language, with the most cordial hatred to-

wards each other. Fresh champions of the opposite creeds followed each other in endless succession, as their predecessors retired, exhausted or defeated, from the lists. At one moment the authenticity of the poems seemed established beyond all doubt; in the next it was made still more clear that they were the most impudent forgeries that were ever imposed upon the credulity of the literary world. These were the results of the labours of the more active and zealous partisans of the denying and believing factions; but there were others again, who did not strictly belong to either, and these, taking arguments from both sides, succeeded with much ingenuity in involving the question in an obscurity from which it has not emerged to this day.

The Ossianic controversy, like all other controversies, soon became personal, and in nearly every case the discussion of the point exhibited fully as much abuse as arguments. During all this time Macpherson himself, the cause of all this bitterness of spirit and uncharitableness, and the only person who could have allayed it, kept sullenly aloof, and refused to produce that evidence which alone could restore the peace of the literary world, and which he yet declared he possessed. Notwithstanding the celebrity, however, which he was thus acquiring, his situation, in other respects, was by no means an enviable one. By those who did not believe in the authenticity of the poems, he was reviled as an impudent unprincipled impostor; by those who did, he was charged with being a bungling unskilful translator; and by both he was abused for his obstinacy in refusing to come forward with his testimony in the cause in dispute.

Before proceeding to take a nearer view of the Ossianic controversy itself, there will be no impropriety in alluding to certain opinions regarding the subject of it, which have now pretty generally obtained. These are, that it is of little moment whether the poems are genuine or not; and that they are not, after all, worthy in point of merit of the notice they have attracted, or of the discussion and dissension they have created. With regard to the last it is matter of opinion, and must always remain so, since it cannot be decided by any rule of taste. The first again involves a sentiment more specious perhaps than profound; for, besides the consideration that truth is at all times and in all cases better than falsehood, and possesses an intrinsic value which in almost every instance renders it worthy of being sought for, the investigation into the authenticity of the poems of Ossian involves, in the language of the ingenious commentator already named, matter of importance to the "general history of literature, and even that of the human race."

Whatever weight, however, may be allowed to these considerations, it is certain that Macpherson's *Poems of Ossian* have lost a very large portion of the popularity which they once enjoyed, and are evidently losing more every day. The rising generation do not seem to have that relish for their beauties, or rather do not see those beauties in them which captivated their fathers, and this can be ascribed only, either to a change in literary taste, or to some defect or defects in the poems themselves, which improved intellectual culture has detected; for it is the result of an opinion formed on their abstract merits as literary compositions, and is wholly unconnected with the question of their authenticity, that now being considered a point of such indifference as to be but rarely taken into account in the decision. The book is now taken up without a thought being wasted on the consideration whether it be the production of Ossian or Macpherson, and

is judged of by its own intrinsic value; and tested in this way, it would appear that it has been found wanting—a result which seems to show that the greatest charm of the poems, even at the time when they were most appreciated, co-existed with the belief that they were genuine relics of antiquity; that it was inseparable from this belief; that it was born of it, fostered by it, and perished with it; that, in short, it lived and died with it, and was exactly proportioned to its strength and its weakness.

Of the controversialists in this celebrated literary war the list is both long and illustrious, and comprehends some of the proudest names of which this country has to boast. Amongst them occur those of Dr. Blair, Dr. Gregory, Lord Kames, Hume, and Dr. Johnson. The most remarkable next to these were, Dr. Smith of Campbelltown, Dr. Graham of Aberfoyle, Sir John Sinclair, Mr. Laing, author of *Notes and Illustrations*, introduced into an edition of Ossian's poems, published in Edinburgh in 1805; Mr. Alexander Macdonald, author of a work entitled "*Some of Ossian's Lesser Poems Rendered into Verse*," with a Preliminary Discourse in Answer to Mr. Laing's Critical and Historical Dissertations on the Antiquity of Ossian's Poems," 8vo, Liverpool, 1805; and W. Shaw, A.M., author of *An Inquiry into the Authenticity of the Poems of Ossian*, London, 1781. There were besides these a host of others, but of lesser note. Of those just named, there were six who may be said, generally speaking, to have been in favour of the authenticity of the poems, and five against it. The former were Dr. Blair, Dr. Gregory, Lord Kames, Dr. Graham, Sir John Sinclair, and Mr. Macdonald. The latter Mr. Hume, Dr. Johnson, Mr. Laing, Dr. Smith, and Mr. Shaw.

Here then we are startled at the very outset by the near approach to equality in the amount of intelligence and talent which appears arrayed on either side; nor is this feeling greatly lessened in comparing the evidence adduced by each party in support of their opposite opinions, and in confutation of those of their opponents. Both seem conclusive when taken separately, and both defective when placed in juxtaposition.

Although, however, two classes only of controversialists have been made above, there were actually four, or rather the two given are found on closer inquiry to be again subdivided—of the believers, into those whose opinion of the authenticity of the poems was unqualified, and those again who believed them to be authentic only to a certain extent, while the remainder were interpolations by the translator. Of the former were Blair, Gregory, Lord Kames, Sir John Sinclair, and Macdonald. Of the latter was Dr. Graham, and though only one, he was yet the representative of a large body who entertained a similar opinion. Of the disbelievers, again, there were those who utterly denied their authenticity; and those who, entertaining strong doubts, did not yet go the whole length of rejecting them as spurious. Of the first were Dr. Johnson, Laing, and Shaw. Of the last, Mr. Hume and Dr. Smith.

The controversy thus stands altogether upon four separate and distinct grounds. These are, first, an entire and unqualified belief in the authenticity of the poems; second, a belief that they are in part genuine, and in part spurious, including a charge of interpolation and false translation; third, much doubt, but no certainty; and fourth, a thorough conviction of their being wholly forgeries.

The principal arguments adduced in support of the first opinion are—that the poems bear internal evidence of antiquity;—that their originals are or were

well known in the Highlands, and that there were many persons there who could repeat large portions of them; that Macpherson's talents, judging by his own original works, *The Highlander; Translation of the Iliad, &c.*, were not equal to the production of poems of such transcendent merit as those ascribed to Ossian; that many credible witnesses were present on various occasions when Macpherson was put in possession of these poems, orally and by MS.; and, lastly, that the originals themselves are now before the world.

With regard to the internal evidence of the genuineness of these poems, it is to be feared that this is a thing more ingenious than sound; and, like the imaginary figures that present themselves in the fire, is more easily described than pointed out. It will, at any rate, scarcely be deemed sufficient proof that the poems in question are ancient, merely because they bear no likeness to any that are modern.

Dr. Blair's celebrated dissertation on this subject, and on the authenticity of the poems generally, is much more elegant, ingenious, and learned, than convincing; and appears, after all, to establish little more, indeed little more seems aimed at, than that the poems may and should be ancient, not that they are. To those who think that the absence of all modern allusion in the poems, and the exclusive use which is made of natural imagery, without one single exception, is a proof of their antiquity, the argument of internal evidence will have no doubt considerable weight; but there are others who see in this circumstance only caution and dexterity on the part of Macpherson, and who in consequence, instead of reckoning it an evidence of his veracity, consider it but as a proof of his ingenuity.

As to the assertion again, that the originals were well known in the Highlands, and that there were many persons there who could repeat them. This, on inquiry, turns out to mean only that fragments of Gaelic poetry—not entire poems, as given by Macpherson, but certainly, such as they were, of undoubted antiquity—were to be met with in the Highlands. That such were, and probably are, to be found there even to this day is undeniable; but, in the first place, they have been in no instance found in the complete state in which they appear in the translations, but disjointed and disconnected, and, still worse, bearing only in a few instances any more than a resemblance to the English poems. In large portions even this is entirely wanting. The originals, then, in the only sense in which that word ought to be used, cannot with truth be said to have existed in the Highlands. Fragments of ancient poetry, as already said, did indeed exist there, but not the mass of poetry given to the world by Macpherson as the poems of Ossian, and said by him to have been collected in the Highlands. The assertion, therefore, has been made, either with a view to deceive, or without a due consideration of the meaning of the terms in which it is conveyed.

The argument deduced from Macpherson's talents, as exhibited in his original works, to show that he could not be the author of the poems in question is plausible; but the premises on which it is founded are by no means of so incontrovertible a nature as to give us implicit confidence in the conclusion. That a literary man may utterly fail in one or more instances, and be eminently successful in another, is perfectly consistent with experience. It has often happened, and is therefore not more extraordinary in Macpherson's case, supposing him to be the author, and not merely the translator, of the poems ascribed to Ossian, than in many others that could be named. Besides, something like a reason is to

be found for his success in this species of composition, in the fact that from his earliest years he was an enthusiastic admirer of Celtic lore; and that his poetry in particular was one of his constant and most agreeable studies. This argument then can have no great weight, unless it be deemed an impossibility that a man who had failed in one or more literary attempts should be successful in another; an assertion which, it is believed, few will be hardy enough to venture, and which, it is certain, fewer still will be able to make good.

With regard to that part of the controversy where evidence is produced by credible, and in several of the instances certainly highly respectable witnesses, of Macpherson's having been put in possession, in their presence, of various poems ascribed to Ossian, both oral and written;—without questioning the credibility of these witnesses, an important objection may be fairly brought against the nature of their evidence. It is liable to that charge of generality which Mr. Hume thought, and every impartial person must think, ought to be considered "as being of no authority." In no single instance is any particular poem, or any particular part of a poem, distinctly traced by such evidence from its original possessor to the pages of Macpherson's volumes. Not one of them has stated the results of what came under his own observation, in anything like such plain terms as "I saw or heard Macpherson put in possession of the first duan of Cath-loda; I read it over carefully at the time, and I assert that the English poem of that name which he has given is a translation of the same." The witnesses alluded to have said nothing like this. The amount of their evidence is, that it consists with their knowledge that Macpherson did obtain Gaelic poems when in the Highlands. They saw him get some in MS., and they were present when others were recited to him. But here their testimony terminates; and in no case have the poems been further identified in the English dress with those which he procured on these occasions, than as bearing, in some instances, a general resemblance to them. The extent to which Macpherson made use of what they saw him get, or indeed what use he made of it at all, they have not said, because they could not; for although he carried away the originals, they did not, and could not, therefore ascertain, by the only process by which it could with certainty be ascertained—by collation, what he had omitted, or what he had retained; what he had changed, or what he had left unaltered.

We come now to the last proof exhibited in support of the authenticity of the English poems of Ossian, and it is by far the most startling of the whole. It would seem indeed, were it adopted without examination, to set the question for ever at rest, and to place it beyond the reach of all further controversy. This proof is the *Originals* published by Sir John Sinclair in 1806, an evidence which certainly appears at first sight conclusive; but what is the fact? They are not originals, in so far as the written poetry which Macpherson obtained is concerned; for they are all in his own handwriting or that of his amanuensis. The term *original*, therefore, in this case, can only be applied to what he wrote down from oral communication; and it will at once be perceived how much their evidence is already weakened by this limitation of the meaning of the word *original*, as employed by Sir John Sinclair. How far, again, it may be relied upon as applied to the oral communications which Macpherson received, must entirely depend upon the degree of faith which is put in his integrity. He has said that they are the originals, but this is all we have for it, and by many,

we suspect, it will scarcely be deemed sufficient. He had a control over these documents which greatly lessens, if it does not wholly destroy, all faith in them as evidences; while his interest in producing them must lay them open, under all circumstances, to the strongest suspicions. But it is said that it is not likely that he would be at the trouble of going through so laborious a process as this, merely to support an imposture—that, though willing, he was, from his want of skill in the Gaelic language, unfit for the task, and could not have produced poems in that language of such merit as those which he gave as originals—that the Gaelic poems are superior to the English—and lastly, that from impartial and critical examination, the former must have been anterior to the latter. With regard to the first of these assertions it seems to be merely gratuitous, as it rests upon a question which Macpherson himself alone could determine, and can therefore be of no weight as an argument. That Macpherson was greatly deficient in critical knowledge of the Gaelic language, and that he could not consequently produce poems in that language of such merit as those which he represents as the originals of Ossian, is certain, because it is established by the clearest evidence, and by the concurring testimony of several eminent Gaelic scholars; but although he could not do this himself, he could employ others to do it, and it is well known that he was intimate and in close correspondence with several persons critically skilled in the Gaelic language, of whose services he availed himself frequently and largely when preparing his *Translations*. Might he not have had recourse to the same aid in translating from the English to the Gaelic? Dr. Johnson thought so. "I am far from certain," says the sagacious moralist, "that some translations have not been lately made that may now be obtruded as parts of the original work." In truth, the presumption that Macpherson did procure Gaelic translations to be made from the English is exceedingly strong, as will appear from various circumstances yet to be alluded to. At all events it does not seem by any means an inevitable conclusion, that because he was not himself capable of writing what are called the originals, they are therefore original. But the strongest part of the argument in favour of their originality yet remains. It is said that the Gaelic is superior to the English, and that on an impartial and critical examination it appears that the former must have been anterior to the latter. Now the first of these is again matter of opinion, and as such, entitled to no more consideration than opinion generally deserves. To many their merits will appear on the whole pretty equal; to others, the Gaelic will, in some instances, seem the more beautiful; and in some, again, the English. The second assertion, however, is not of this description. It is not founded on opinion, but on an alleged positive internal evidence. It is to be regretted, however, that that evidence had not been pointed out in more specific terms than those employed—that it had not been distinctly said what are those particular circumstances which, on a perusal, establish the relative ages of the Gaelic and English versions; for, on an impartial and critical examination lately made by a person eminently skilled in the Gaelic language, for the express purpose of furnishing information for this article, it does not appear, at least from anything he could discover, that the Gaelic poems must of necessity have preceded the English. They certainly contain nothing that shows the contrary—nothing that discovers them to be of modern composition; but neither do Macpherson's English poems of Ossian. Neither of them betray themselves by any slip or

inadvertency, and this, negative as it is, is yet all that can be said of both as to internal evidence.

What has just been said includes nearly all the leading and direct arguments which have been employed in the defence of the authenticity of Macpherson's translations of the poems of Ossian, and nearly all that can be urged against that belief, with the exception of that which may be deduced from Macpherson's own conduct in relation to the question, and which shall be afterwards referred to.

We come now to consider the grounds of the belief that the poems are in part genuine and in part spurious; including a charge of interpolation and of false translation. What has been already said having necessarily included all the ramifications of the controversy, the consideration of this point need not detain us long, for happily the evidence is not only quite at hand, but of the most conclusive and satisfactory description. That some portion of Macpherson's English poems are genuine, at least in so far as that can be considered genuine of which the utmost that the committee of the Highland Society found themselves warranted in saying, after much and careful inquiry was, that it bore a strong *resemblance* to certain fragments which they themselves had obtained, is beyond doubt. Macpherson, as before said, certainly did gather some scraps of poetry in the Highlands, and as certainly did make some use of them in the composition of his poems. But that he introduced a great deal of his own, that he interpolated, and that he translated falsely the little he got, is equally certain. The fact is incontrovertibly established by Dr. Graham, to whose able work on the subject, entitled *An Essay on the Authenticity of the Poems of Ossian*, we refer the reader for more full information, and is thus confirmed by the committee of the Highland Society, who, after stating in their report that they had "not been able to obtain any one poem the same in title or tenor with the poems published by him," proceed to say, "It (the committee) is inclined to believe that he (Macpherson) was in use to supply chasms, and to give connection, by inserting passages which he did not find, and to add what he conceived to be dignity and delicacy to the original composition, by striking out passages, by softening incidents, by refining the language, in short, by changing what he considered as too simple or too rude for a modern ear, and elevating what, *in his opinion*, was below the standard of good poetry." What immediately follows this sentence, though not relevant to the point immediately under discussion, is too important to be passed over. The committee goes on to say, "To what degree, however, he exercised these liberties it is *impossible* for the committee to determine." Now this means, if it means anything, that the interpolations were such close imitations of the original, that of the whole poems, it was impossible to distinguish which was Ossian's and which Macpherson's; therefore, that the poetry of the latter was as good as that of the former. An admission this that would seem to settle the point of Macpherson's ability to forge the poems, a point so strongly insisted upon by the defenders of their authenticity, by showing that he *was* competent to write them; and in accordance with this it may be asked, if he wrote a part thus excellently, why might he not have written the whole? Dr. Graham, it is true, has, in several instances, detected "Macpherson's bombast," but this only shows that Macpherson has occasionally fallen into an error, which it was next to impossible to avoid altogether in a work written in the peculiar style of Ossian's poems.

There still, however, remains one overpowering

circumstance, which, if there were no other evidence against the fidelity of Macpherson, would probably be held by most unprejudiced inquirers as quite conclusive of the whole question. The *Originals* correspond exactly with the *Translations* in language, and indeed in every point. How can this be reconciled to the fact, admitted by Macpherson himself, that he took certain liberties with the original Gaelic? The *Originals*, when published, might have been expected to exhibit such differences with the *Translations* as would arise from Mr. Macpherson's labours as an emendator and purifier of the native ideas. But they do not exhibit any traces of such difference. The unavoidable conclusion is, that the originals prepared by Macpherson, and published by Sir John Sinclair, were either altogether a forgery, or were accommodated to the *Translations*, by such a process as entirely to destroy their credit, and render their publication useless.

We shall now proceed to take a view of the conduct of Macpherson himself, in so far as it relates to the controversy which he had been the means of exciting, and when we do this we shall find that whether he really was an impostor or no, in the matter of the poems, he pursued exactly the course, with regard to them and the public, which an impostor would have done. He was accused of being guilty of an imposition. He took no steps to rebut the charge. He was solicited to give proofs of the authenticity of the poems. He refused, and for upwards of thirty years submitted to wear the dress of a bankrupt in integrity, without making any attempt to get rid of it. He affected, indeed, a virtuous indignation on all occasions when the slightest insinuation was made that an imposition had been practised; and instead of calmly exhibiting the proofs of his innocence, he got into a passion, and thus silenced, in place of satisfying, inquiry. "To revenge," says Dr. Johnson, speaking of Macpherson's conduct in this matter, "reasonable incredulity by refusing evidence, is a degree of insolence with which the world is not yet acquainted; and stubborn audacity is the last refuge of guilt."

A suspicion of the authenticity of the poems almost immediately followed the appearance of those published in 1762, and the first public notice taken of it by Macpherson himself occurs in 1763, in his preface to *Temora*, published in that year. He there says, "Since the publication of the last collection of Ossian's poems, many insinuations have been made, and doubts arisen, concerning their authenticity. I shall probably hear more of the same kind after the present poems make their appearance. Whether these suspicions are suggested by prejudice, or are only the effects of ignorance of facts, I shall not pretend to determine. To me they give no concern, as I have it always in my power to remove them. An incredulity of this kind is natural to persons who confine all merit to their own age and country. These are generally the weakest, as well as the most ignorant, of the people. Indolently confined to a place, their ideas are very narrow and circumscribed. It is ridiculous enough to see such people as these are branding their ancestors with the despicable appellation of barbarians. Sober reason can easily discern where the title ought to be fixed with more propriety. As prejudice is always the effect of ignorance, the knowing, the men of true taste, despise and dismiss it. If the poetry is good, and the characters natural and striking, to these it is matter of indifference whether the heroes were born in the little village of Angles in Jutland, or natives of the barren heaths of Caledonia. That honour which nations derive from ancestors, worthy

or renowned, is merely ideal. It may buoy up the minds of individuals, but it contributes very little to their importance in the eyes of others. But of all those prejudices which are incident to narrow minds, that which measures the merit of performances by the vulgar opinion concerning the country which produced them, is certainly the most ridiculous. Ridiculous, however, as it is, few have the courage to reject it; and I am thoroughly convinced that a few quaint lines of a Roman or Greek epigrammatist, if dug out of the ruins of Herculaneum, would meet with more cordial and universal applause, than all the most beautiful national rhapsodies of all the Celtic bards and Scandinavian scalds that ever existed." This, it is presumed, will be thought rather an odd reply to the doubts entertained concerning the authenticity of the poems; or rather it will be thought to be no reply at all. It is all very well as to reasoning and writing; but, it will be perceived, wonderfully little to the purpose. All that he condescends to say in this rhapsody to the point at issue—the "doubts"—is, that he "has it always in his power to remove them." But he made no use of this power then, nor at any period during his after-life, though urged to it by motives which gentlemen and men of honour have been always accustomed to hold as sacred.

When pressed by the committee of the Highland Society of London to publish the originals, and thus satisfy the public mind as to the authenticity of the poems, Macpherson thus replies to the secretary of that body:—"I shall adhere to the promise I made several years ago to a deputation of the same kind, [in their anxiety to have the question set at rest, they had proposed that another deputation should wait upon him for this purpose,] that is, to employ my first leisure time, and a considerable portion of time it must be to do it accurately, in arranging and printing the originals of the *Poems of Ossian*, as they have come to my hands." The delay here acknowledged, a delay of several years, and the further delay bespoken, as it were, in this extract, between the promise of giving the originals to the world and its fulfilment, will seem to many suspicious circumstances, and will appear rather a necessary provision for getting up a translation from the English, than for the preparation of original documents. Nor is this suspicion lessened by his telling us that they were yet to arrange; a process which it will be thought must of necessity have taken place before they were translated. It seems odd that the translations should be in perfect order while the originals were in confusion. The mere disarrangement of sheets of MS., from passing through the hands of the printer, or from inattention, could scarcely warrant the formidable and cautious provision of "a considerable portion of time."

The fact of Macpherson having interpolated, although it could not have been ascertained by other evidence, would be sufficiently established by his own. When taxed by Dr. Macintyre of Glenorchy with being himself the author of the greater part of the poem of *Fingal*—"You are much mistaken," replied Macpherson; "I had occasion to do *less* of that than you suppose." Thus admitting the fact, and only limiting its extent.

On the whole it seems, on a careful revision of all that has been said on this once famous controversy, beyond all doubt that Macpherson is, in nearly the strictest sense of the word, the author of the English *Poems of Ossian*. The skeleton was furnished him, but it was he who clothed it with flesh, endued it with life, and gave it the form it now wears. He caught the tone and spirit of the Celtic lyre, from

hearing its strings vibrating in the wind. The starting note was given him, but the strain is his own. Whatever degree of merit, therefore, may be allowed to these strains, belongs to Macpherson.

MACPHERSON, MAJOR SAMUEL CHARTERS, C.B. "These memorials tell of a barbarous race won over from dark and cruel rites; and of an important Indian state rendered in the hour of need a mainstay of the empire, when its defection would have involved that of every native power." In this manner a work, entitled *Memorials of Service in India*, introduces, in its first sentence, the philanthropic, high-minded, energetic soldier who now comes under our notice. Although the eulogy is great, the narrative shows how justly and how well it was merited.

Samuel Charters Macpherson was the second son of Dr. Hugh Macpherson, Professor of Greek in the university of Aberdeen, and of the professor's first wife, Anne Maria Charters; and was born at King's College, Old Aberdeen, on the 7th of January, 1806. Being a sickly child, the earlier part of his education was received at home under private tutors; and although his classical training was carefully attended to, his intellectual bias was shown in his favourite studies of botany, chemistry, and geology. Having become a student at the university of Edinburgh, he, at the age of sixteen, attended the class of moral philosophy presided over by the celebrated John Wilson; and as it was impossible for a lively and inquiring mind to be at rest under the lectures of such a professor, he was wont to discuss them in the evening with his tutor, the Rev. Dr. George Tulloch, who on such occasions was catechised, cross-questioned, and puzzled by his eager pupil as he had never been before. "He unconsciously showed great ability," adds Dr. Tulloch; "his talents and capacity were very far superior to those of his contemporaries; and I count it great honour to have aided slightly in developing his reasoning powers, and his love of doing good for its own sake without the least alloy of vanity or self." The next two years were spent by Samuel Macpherson at Trinity College, Cambridge; and although he had outgrown the sickness of his boyhood, and become a tall vigorous young man, he suffered under an increasing delicacy of his eyes, which obliged him to limit his studies, and consequently to fall short of that scholastic distinction which was otherwise within his grasp. But considering the great work of life that lay before him, it was perhaps better that thus it should be. Being unable to pore long and closely upon books, he was obliged the more to study those living volumes with which his college abounded; and by associating with his class-fellows, he acquired that experience of men and their characters, and those ingratiating habits of social intercourse, which books alone cannot communicate, and which availed him so well in India.

Having intended to follow the profession of the law as an advocate at the Scottish bar, Samuel Macpherson, after a stay of two years at the English university, returned to Edinburgh, and commenced the usual course of reading. But the new and voluminous subjects into which he was obliged to enter, and especially the study of political economy and civil law, were too much for him; his eyesight failed, and on consulting with the best surgeons of the day, they gave him little hope that his eyes would endure the necessary application for becoming a successful legal practitioner. He must adopt some profession less dependent upon reading and research; and instead of a lawyer, he resolved to become a soldier. A

cadetship in the East India Company's service having been obtained for him, he set off for Madras early in 1827; and the long trying voyage to India, which often makes the peaceful pugnacious and the benevolent selfish, only served to draw out the natural kindness of his heart. He had secured for the voyage the luxury of a large and airy cabin; but a young cadet having fallen sick, he transferred him to his own comfortable berth, and nursed him during his illness, contenting himself the while with a very sorry crib. In June he arrived at Madras, and soon after was posted to the 8th Regiment of Native Infantry at Jalah.

Time passed on with Ensign Macpherson for nearly three years, the dull monotony of military life in India being only alternated with a long attack of ill health, which obliged him to retire to the hills on leave of absence,—and researches in geology, for which his movements gave him excellent opportunity. But in the summer of 1831 he was not only promoted to the rank of lieutenant, but appointed assistant surveyor-general of the Hyderabad country, 500 miles in length and as many in breadth, "and presenting as many and as varied objects of moral and physical interest as are bounded by similar lines in any portion of Hindostan." It was no wonder that this appointment, so accordant with his scientific pursuits, filled him with joy, and speedily restored him to his wonted health. Besides his qualifications for such an office which he had acquired by his home-studies, he was now a fluent Hindostance scholar, and tolerably well acquainted with Persian. The state of his eyesight, however, still continued to be his principal difficulty, and after he had been more than a year employed in office, he thus good-humouredly alluded to the drawback: "By a curious infelicity of fortune, after having quitted one hemisphere on account of visual incapacity, I find everything conspire to assign more optical power as the best of my faculties in another." His surveys, however, were so well appreciated at head-quarters, that he was in 1835 promoted to the office of surveyor-general of the Nellore district, which lies immediately to the north of Madras, betwixt the sea and the Eastern Ghauts. He had not long resided in this district when the Goomsur war of 1836, in which his regiment, the 8th Native Infantry, had for some time been serving, recalled him from the tent of the surveyor to that of the soldier. It was in the course of this service that he became acquainted with those aboriginal tribes upon whose pernicious rites and customs he was destined to exercise the happiest influence.

These tribes, the Khonds, the Koles, and the Sourahs, who constituted in very ancient times the primitive races of Orissa, had been dislodged by the Hindoos who succeeded them, and driven into the more unhealthy or less productive parts of the country, where they were considered as the serfs of the conquerors, and as such were subject to their usurpations. Against this degradation however they were more or less apt to rebel, and assert their native independence. It was our own story of the Saxon aggression upon the Celt, or the Norman upon the Saxon, exhibited in India with a few oriental variations before the days of William the Conqueror or Malcolm Canmore. Of these tribes, the mountaineers were the proudest and most independent, in this case resembling the Highlanders of Scotland before the union, and were governed by their patriarchal chiefs, who paid little more than a nominal submission to the authority of their foreign rulers. Of the very existence however of such a high-spirited people the British government in India was utterly ignorant, until mere chance brought it into collision with the

Khonds of Goomsur. That zemindary owing certain unpaid arrears of tribute to the East India Company, its rajah, in consequence of the attempts of the latter to enforce payment, retired into the Khond districts above the Ghauts; and when the British troops followed, they were surprised to find themselves among a hostile people of whom they as yet had never heard. Such a collision could not occur without blows, and hence the Goomsur rebellion of 1835. The mountaineers rallied around the son of the rajah, the father being now dead, as devotedly as our own Highlanders rallied around "Prince Charlie," and for this their country was laid waste by the British and their chiefs executed. It was in the last and strongest effort of their resistance in 1836 that Lieutenant Macpherson rejoined his regiment in the camp at Goomsur. After having had his share of a weary military campaign until the close of the year, he was sent to survey a portion of the zemindary in the plains and lower hills; and in the following year he was sent upon another mission of survey into the unexplored part of the country, a service which he alone was judged capable of performing. The territory to be surveyed on this occasion was the northern part of the Khond country from Goomsur to the Mahanuddee.

By this appointment Lieutenant Macpherson was introduced into the sphere for which he was best fitted, and which he so ably and worthily occupied for years. He was now to come into close intercourse with the Khonds, of whom we were still comparatively ignorant. Several British officers indeed who had entered the country were so disgusted with the prevalent barbarism, that they made haste to quit it, without being able to tell anything to purpose either of the region or the people. But such a proceeding would not have satisfied Macpherson. Regardless of self, he was intent not only to perform his professional duties, but to perform them well: but in addition to this, he was anxious to become acquainted with these brave but oppressed and half-savage Khonds, that he might win their confidence and affection, for the purpose of promoting their best interests. For this, too, while he possessed those facilities for daily intercourse with them which few of his countrymen enjoyed, he had that open frankness of disposition and manners, and that clear-ringing sincerity of conversation, which could win irresistibly upon the savage and civilized alike. This his amiable disposition had taught him to cultivate, and in this consisted his power over the Khonds. A curious instance of the effect of his winning manner was afforded soon after his entrance among them, which is thus told by his biographer and brother. "A fierce old chief, the patriarch of Baramullick, called Bagwan Sow,¹ commonly known as 'the Great Sow,' came to his tent to pay him a visit of mere curiosity, full of ill-will and disaffection, and believing himself and believed by all his followers to be one of the most important of living men. He was to call his new-born son after Dora Bissye, the chief (not yet captured) of the insurrection, 'the greatest and wisest man he knew.' His host jokingly said, 'You had better call your next son after me, and then you will have friends on both sides,' a proposal which was received with a snort of indignation. But after passing a week in camp, using his eyes and ears, and enjoying the hospitality of his new acquaintance, the Great Sow was quite another being; and at last he spoke out, saying, 'You are a great and wise people, and know everything; and

we are poor jungle beasts, and know nothing.' So he ended by learning with much pains the name of 'Maak' to call his next son by, a promise which he faithfully kept, adding the name of some Hindu god; and many years afterwards, on hearing that his friend's authority was opposed, he raised his men and marched to his assistance."

Before such a man as Lieutenant Macpherson the whole history, character, and usages of such a people were laid open, and he soon learned to know the Khonds in their strength and weakness, their virtues and their crimes. Their religion also occupied much of his attention, as it was in this that some of their worst faults originated. He characterized it as "a weak incoherent theism, with a subordinate demonology, the reflection of the wants and fears and predominant sentiments of a rude society;" and as many of its fruits were wholly incompatible with humanity and the rule established in British India, he drew up a statement of their religion, and afterwards another, which, with several improvements and additions upon the first, was read before the Royal Asiatic Society of London in 1852. The first and most clamant of the crimes inculcated by this creed was the practice of human sacrifice. The victim was sacrificed to the earth-goddess Tari, under the belief that every benefit proceeded from her, and that to receive them or continue to enjoy them it was necessary to propitiate her with human sacrifices, which were her food. A service represented as so necessary of course became prevalent, and the horrid rite was solemnly practised in every district every month of the year. The victims were of three kinds: one class was purchased from some other tribe or race; another were born victims, and sacrificed by hereditary right; a third class were children presented to the doom by their parents or natural guardians; and when the day arrived for their immolation, it was held as a day of public feasting and licentious revelry. Nor were the refinements of cruelty omitted in the mode of sacrifice. Sometimes the victim was torn to pieces by the wild worshippers, who preserved every morsel of his flesh as a charm with which to make their fields fruitful and their households healthy. Sometimes he was roasted to death before a slow fire, his protracted agonies adding value to the rite. Such was the worship and such the devil-sabbaths among a people otherwise simple, industrious, and benevolent. The peculiar atrocities of such a murderous creed excited, when made known, a feeling of universal horror, and the governor-general of India vowed to put an end to the hideous practice. But how was this to be done? If by force, the British troops necessary for the purpose could subsist in these districts only three months in the year. And if more lenient measures had been adopted, and the captives ransomed with money, it is certain that as large, or even a larger, number of victims would have been procured with the purchase-money. The tenacity of the eastern character, especially under persecution, would have laughed such attempts of conversion to scorn; and so long as the heart of the Khond was unchanged, Tari would continue to be worshipped with human sacrifices.

Another evil practice originating in such a perverse creed, was that of infanticide. This practice, which was prevalent more or less among all the Khond tribes, was so predominant among certain of them belonging to the sect of Boora, that no female infant was spared except when a woman's first child was a female, and whole villages containing a hundred houses might be seen without a single female child. This arose from the extreme looseness of the marriage tie, and the extraordinary license accorded to

¹ Sow is a title of honour among this people instead of one of contempt.

female infidelity founded upon the sanctions of their religion. The influence of the Khond women, especially in public affairs, was greater than that which was allowed to their sex even in the ancient forests of Germany. But this liberty was connected with still greater license, by which the former was counteracted and changed into a curse. If a wife was unfaithful to her marriage it was only her paramour who suffered; and at any time, with a few exceptions, she might leave her husband, return to her father's house, and contract a new marriage. A woman might also enter a house and establish herself as its mistress, while the man thus invaded must make her his wife, or entail disgrace on himself and his tribe by refusal. In taking a wife, who must always be from a tribe different from that of the suitor, the bridegroom paid a large price in money and cattle, which was chiefly subscribed by his near relatives, and the branch of his tribe to which he belonged; but the bride's father, instead of enjoying this dowry, was obliged to distribute it among the fathers of his own clan. His case, however, was hard in this respect, that should his daughter leave her husband and return to him, he was obliged to return to the husband the full amount at which she was purchased. These liabilities of each tribe for every member of its community, the debts they occasioned, and the difficulty of a fair partition of the burden, were such, that these Khond marriages have produced three-fourths of the sanguinary quarrels and feuds of the country, which have been pursued with Highland duration and pertinacity. Hence the saying prevalent among the Khonds: "To any man but a rich and powerful chief, who desires to form connections, and is able to make large and sudden restitutions, and to his tribe—a married daughter is a curse. By the death of our female infants before they see the light, the lives of men without number are saved, and we live in comparative peace."

The British government had first attempted to suppress the practice of human sacrifice among the Khonds by force, but the result of two campaigns showed the hopelessness of such a remedy. The next expedient used was moral influence, but this also was inefficient, as it only changed the evil from an open to a guarded and private rite. After a fruitless struggle, Lieutenant Macpherson was appointed assistant to the agent of the governor of Fort St. George in Gunjam, ostensibly for the purpose of road-surveying and road-constructing, but in reality for humanizing the Khonds, with whom his office would bring him into close and frequent contact. By his instructions he was directed, while ostensibly finding occupation in surveying a road, to make the suppression of human sacrifices his principal object. He was to take every opportunity of expressing his abhorrence of such a custom. He was to be careful, however, not to speak of it as exclusively belonging to the Khonds, but as a custom prevailing among barbarous tribes in every part of the world, although repudiated by all civilized people, and equally contrary to the law of God and man. With this commission Captain Macpherson (for he had now attained that rank) commenced his professional labours among the Womunniah Khonds, whom he had never visited before; and although his arrival in the character of a government agent was at first regarded with fear and suspicion, his conciliatory manners so won upon the simple people, that their shyness was soon changed into a universal welcome. Here he found, too, that those tribes among whom infanticide was most prevalent abhorred the rite of human sacrifice; while those who practised the latter condemned the inhuman practice of infanticide. Careful of the chief

object of his mission, while he laid out a government road he cautiously proceeded to break ground in the stubborn soil of the national religion. His arrival was at the close of 1841, and in the following year his means of action were increased by an appointment which constituted him collector, judge, and magistrate of the district. On the 2d of June, 1842, he was thus enabled to report his progress: "I have had the Khonds in to reason with me, tribe by tribe; and the change that has come over their minds, although very far yet from being that which I desire to induce, is very remarkable. How long it will last is also a problem to solve. One cluster of tribes has promised to forego the sacrifice, demanding on our part justice, as it is to be had in the low country; the severest punishment by us of the violation of the agreement:—permission to sacrifice buffaloes, monkeys, &c., with all the ceremonies usual on occasions of human sacrifice; to be permitted to denounce the government to their gods upon all occasions as the cause of this relinquishment of their ancient worship; and the indication to those deities of Baba Khan in particular as the chief persuader—Baba willingly assuming the entire responsibility. Another group has gone away to bring me in their victims, and I am anxiously expecting the completion of their intention. There would have been no difficulty had I sent for them; but their spontaneous delivery is an extraordinary effort, and I am not at all certain that the poor people are equal to it." After seven weeks his doubts on this last head were laid to rest. When the measure was proposed by the chiefs to the people, there was much disputation and demur, but at last they all consented, with the exception of the people of two tracts, who declared that they would not abandon their ancient worship. Little more than four months afterwards (16th October) he writes: "Things are going on, at least, as well as could have been hoped. I have pitted the power of simple justice against that of superstition—not, of course, expecting the former, unaided, to prevail, but the fight is a far better one than anything which I know of human nature would have led me to anticipate. I have had a very anxious time of it, but two of the great months have been got over without an offering, public or secret, in the parts of which I am trying to make conquest. In other respects I have the people entirely with me."

The history of the year 1842, in which such a striking change was effected upon so large a majority of the Khonds, afforded to Captain Macpherson, in its retrospection, matter for satisfaction and wonder. As the public sacrifices were offered by the several tribes in turn, it was easy for those who were now exempt to agree to abstinence from the practice in future. But it was not so with the Mootahs of Courminghia and Calingia, whose turn it was next to make the public offering, and upon whom, therefore, the gentle force of persuasion was brought by Macpherson most earnestly to bear. They told him that they were convinced by his representations; that the opinion of all wise, and good, and great men condemned the rite; and that, for themselves, they abhorred it, and were convinced that no god required it at their hands. And then, too, as the government had promised on their abandonment of human sacrifice to give them the great advantages of protection and peace, they would abandon it, trusting that their gods would acknowledge the weight of the constraining circumstances under which they acted. After they had reached this decisive point, and recovered from the bewilderment occasioned by their decision, they were encouraged by the assurance of Captain Macpherson that his own ancestors had also offered

human sacrifices, but had abandoned them when better instructed, and had since become a great people. "And what gods," they eagerly asked, "did your forefathers adopt after they had relinquished the sacrifice?" Growing at last in boldness, and having thrown their deities overboard, they resolved that the priesthood should follow. Their reasoning on the subject, and the substitute they proposed to adopt in lieu of their spiritual guides, was the most natural which a simple people could adopt. "We can ourselves," they said, "conduct with perfect efficacy every indispensable ceremony of our religion except the great rite—which we have given up: but the priests alone can enable us to cure our diseases and those of our wives and children, by informing us, when attacked, which god is offended, and what is the expiation. Now, had we a doctor who could cure us without a reference to the gods, as we learn that your doctors cure you, all will be well. If we remain dependent on the priests for cure, they will refer all our diseases to the earth-god unpropitiated by human blood, and we must sacrifice or die." Delighted with this solution of the difficulty, "Send us a doctor," they cried with one voice, at a conference of the whole Bara Mootah tribes, "and we will make him a god!" It is perhaps needless to add that their request was complied with.

Our limits do not permit us to give in detail the history of the suppression of human sacrifice among the Khond tribes, or the almost insuperable difficulties experienced by Captain Macpherson in such a philanthropic enterprise. These difficulties also were the more irritating, as they originated not so much in the Khonds themselves, as in the selfish intrigues at head-quarters, by which his powers were limited, his appeals concealed or misrepresented, and a native agent placed among the people, who opposed every effort which Macpherson made to improve them, especially in the suppression of human sacrifices. The district, too, was so unhealthy that a mere stay in it was martyrdom; and while Captain Macpherson was often prostrated by ill health, his company was often on the sick-list to the amount of from fifty to ninety per cent. of their numbers. But while he wrestled with a noxious climate to accomplish a noble but thankless work, his perseverance at last compelled the approbation of his superiors, and procured their full assent to his proceedings. And in 1844 what a triumph had crowned his perseverance! The effect of his two years' labour among the Khonds is thus summed up by his biographer:—"The course of events, then, had been this: a single cluster of the tribes of Goomsur [those of the district of Bara Mootah], moved by the promise, and by the experience of practical benefits conferred, and by—to use the expression officially employed at a later period—"the admirable power of individual character" which Captain Macpherson brought to bear upon them, had unanimously agreed upon his requisitions to give up its human sacrifice, provided that like terms were imposed upon its neighbours. There was no general sickness or failure of crops during the early and critical period, and that cluster of tribes stood firm and true to its compact.

"A second cluster of tribes [those of Athara Mootah] had entered into a similar convention, not at first unanimously; but all had been won over, by delicate and firm treatment, to a perfect adoption of the new system.

"The tribes of the two remaining districts of Goomsur [those of Hodzoghgor and Chokupand] stood out for a time, while the native local agent of the government was suffered to employ, for the main-

tenance of the sacrifice, the influence which he derived from that situation. But upon his removal they gave way, moved by the zealous persuasion of the reclaimed tribes, and by their own experience of Captain Macpherson's administration of justice. Thus the whole of the Khonds of Goomsur were gained."

Another idolatrous monstrosity for the suppression of which he had laboured simultaneously with the suppression of human sacrifice, was infanticide. This enormity was prevalent in a portion of the Khond country, including an area of about 2400 square miles, and possessing a population of 60,000, among whom it was computed that the number of female infants destroyed was from 1200 to 1500 annually. Besides believing that the practice was of divine institution, and therefore not a crime but a virtue, the tribes among whom it prevailed were convinced that it tended to the birth of male offspring, and was the best prevention of those sanguinary feuds which originated in the looseness of the marriage tie among their daughters. It would have been hopeless to extinguish an evil so deeply rooted by prohibitory enactments, and the infliction of pains and penalties; and such a mode of suppression Captain Macpherson had never contemplated. Instead of this, he used the same gentle and persuasive means by which he effected the abolition of human sacrifice. His plan of proceeding, he informs us, was the following:—

"1. To establish the authority of government over each cluster of tribes, by supplying their chief social wants beneficially and acceptably to them—giving them, in the first place, justice and peace; and 2. To attempt to obtain the complete dominion over them, which is necessary to sway them to the changes desired in their religion and their manners, by combining, with the direct authority so acquired, every form of influence which can be created by acting upon their reason, their feelings, their prejudices, their affections, and on the whole circle of their minor interests." A plan thus wisely devised he carried out with equal wisdom. He secured the confidence and love of the people by his upright and benevolent administration, and convinced them how much they would be benefited by the kindness and protection of the Anglo-Indian government. He reasoned with them, and convinced them by argument that infanticide could be justified neither by divine nor human law, and that it added neither to their political strength nor security, but was equally subversive of both. And working upon their obstinate feelings of clanship, from which female infanticide derived such strength, he sought to unite together by marriages those tribes that had hitherto been separated, and to bind them by a common tie to the British government. He accordingly, after long and careful preparation, bestowed fifty-three of the female wards of government saved from sacrifice, in marriage upon the principal men of two of the tribes he had won over, and taught them to value such brides as a connecting link with our government, and a pledge of its favour and protection. Thus the good work was successfully begun, and during the short period from 1842 to 1844, 170 female infants were saved by his interposition.

The next four years of Captain Macpherson's life were years of trouble and disappointment, chiefly arising from broken health, and the misunderstandings and annoyances of government officials, and in 1848 he returned to Britain upon leave of absence. His health being recruited, he returned to India in 1853, and was appointed governor-general's agent at Benares, which in a few weeks after he exchanged for the appointment of the political agency of

Bhopal. Soon afterwards, with the rank of major, which he had attained by brevet, he was promoted by Lord Dalhousie to the important office of political agent at Gwalior. It was a ticklish situation, as Scindiah, the young maharajah, was jealous of his prime-minister Dinkar Rao, an able and upright statesman; while the duty of Major Macpherson as British resident was to advise and aid the latter without interfering with his principal, for the purpose of preserving the tranquillity of the country. The same wisdom and moderation characterized his proceedings which won for him the affection of the simple Khonds, and both rajah and minister approved of his counsels. The effects of this were soon exhibited in the departments of government and the improvement of the country. But still more were they exhibited, when, after a residence of three years at the court of Gwalior, the mutiny in India broke out. In this terrible trial Major Macpherson had such influence on the fickle mind of Scindiah as to confirm him in his adherence to the British. For a month, therefore, after the seizure of Delhi by the mutinous sepoys, the English were enabled to maintain their footing at Gwalior. But on the 14th of June, when the mutiny had become general in Upper India, that part of our eastern army called the Gwalior contingent also broke out into rebellion, and a massacre of the British officers and residents ensued, the horrors of which are too well known to be repeated. At the imminent risk of being murdered in the streets, Major Macpherson made for the palace to prevent Scindiah from being drawn over to the mutiny, but found the maharajah surrounded by his troops under arms, and having a party of British fugitives, for whose protection he had thrown open the palace. Scindiah himself, however, was in sore perplexity, as the rebels expected that he would lead them, or at least supply them with money; and failing these, they had threatened to bombard his palace and city. The major, while providing for the safe conveyance of the British residents to Agra, insisted that he himself should be allowed to remain with Scindiah, who was never more in need of encouragement than at that moment; but as the rebels had determined that the British resident above all others should be sacrificed, Scindiah, consulting his own safety, positively refused him permission to remain. Having no alternative, and perceiving that the Europeans could not be protected an hour longer in Gwalior, Major Macpherson, with the party consisting of thirty fugitives, men, women, and children, commenced their retreat, and through a path beset with dangers reached Agra on the 17th. Indeed, they must have inevitably been massacred on their route, as a strong ambuscade was prepared for their coming, had not the chief of a warlike tribe with a body of well-mounted followers appeared for their rescue. Declaring warmly that he had not forgotten that Major Macpherson had interceded with the government for certain wells and tanks for his people, and that he would spend his life in defence of the party, he escorted them until their safety was insured.

Although the major had thus been compelled to leave Gwalior, his spirit was still present with the dismayed government of the country, and was able to direct their measures even when the storm of mutiny was at the wildest. In parting with Scindiah, who showed at that moment an inclination to join the rebels, or purchase their retreat, Major Macpherson adjured the bewildered and terror-stricken maharajah to remain firm in his alliance with the British government—and instead of getting rid of the mutineers, which would only have sent them to strengthen the disaffection, he exhorted him to detain

them at whatever risk or cost within his territory, until the British were in force enough to crush them, which could not be for three months at soonest. How to detain, and at the same time to control, them was the difficulty, and he was asked the following pertinent question—"Should there be no other means of detaining these rebels against both governments than by taking them into service until the British were strong enough to put them down, would the governor-general approve of the proceeding?" Scindiah was assured that if no other means remained, such a proceeding would be reckoned good service, upon which the rajah promised that the wishes of our government should if possible be executed. This resolution, adopted at the moment by the advice of Macpherson, and persevered in during a long course of danger and trial chiefly through his reiterated appeals transmitted by him from Agra, had a most important influence in impairing the mutiny, and finally in procuring its suppression. These advices, and this line of conduct, by which the major inspired the government of Gwalior to persevere until the danger was over, were also suggested upon his own responsibility alone: he had neither the commands nor the counsels of his superiors to guide him; and the fidelity with which both the rajah and his minister followed out the plan was founded in Macpherson's moral ascendancy, and the implicit trust they reposed upon his wisdom. "Gwalior, while thus continued in his hands, might have been regarded as in one sense the key of India, or rather perhaps as one link of a chain, which could not have given way in any part without ruining our power in India. If the ruler of Gwalior had played us false, or succumbed to the strong adverse elements with which he had to contend, the revolt would almost certainly have been national and general, instead of being local and mainly military; and, instead of its fate being decided by those operations in the easily traversable Gangetic valley, upon which public attention was concentrated, we should have had to face the warlike races of Upper India combined against us in a most difficult country; and, in all probability, those of the south also."¹

The almost supernatural power exercised by a master-spirit, and its influence upon the actions of men, independent of time and place, have been seldom more strikingly exhibited than in the history of Scindiah, and his prime-minister Dinkar Rao, during the course of the mutiny. Although no longer present with them, the major's past lessons and the controlling force of his character elevated the weak changeable rajah into an energetic hero, and the minister into a Cavour of Indian statesmen. This was seen in the firmness with which Scindiah, rejecting the advices of his courtiers, adhered through every danger to the British interests. He detained the contingent at Gwalior for three months, and prevented his own discontented troops from joining the mutineers, although by such a proceeding he daily and hourly endangered his own life. Had but a bugle sounded or single gun been discharged, it would have sufficed as a signal for revolt, and therefore he caused every gun to be watched, and every bugle to be removed to his palace. Even the wheels were removed from the carts, the elephants and camels sent off to distant jungles, and the boats swept from the river, although each proceeding made the danger more completely his own, that he might the more effectually confine the mutinous within his own range; and when they tried every art of cajolery or menace to induce him to join the rebellion, he

¹ *Memoir of Major Macpherson*, by his Brother.

confronted them with a policy more ingenious and threats more formidable than their own. Even when his palace and city were invested, he met the rebels in the field, and by his superior arrangements compelled them to surrender. It was only thus that he could prevent 16,000 well-disciplined soldiers, with excellent artillery and magazines, from joining the mutiny; and when at last he was compelled to let them loose, which was on the 10th of October, and only when the worst of the mutiny was over, he sent them in a direction which was certain to lead them to destruction. These doings, however, were mainly those of Major Macpherson, who daily, from his cell in the fort of Agra, sent words of encouragement and counsel in answer to the rajah's messages of agony or despair. It was only when the danger was over that Scindiah, feeling that he had no further need of his counsellor, sank into his own natural self, and became weak and unstable as he had been before.

With the close of the Indian mutiny the mission and life of Major Macpherson had come to a close also. The heat of Gwalior and the terrible strain of events that had followed on his departure had worn out his health, but still he continued to struggle with his duties, while the prospect of a lieutenant-colonel's pension, to which he would soon have been entitled, and the prospect of returning to Scotland, encouraged him to persevere. But feeling the progress of his sickness accelerated, he proposed, in the beginning of April, 1860, to proceed to Europe, and had set off from Agra to Calcutta for that purpose, but the latter city he reached in a dying state, and at the house of his brother, Dr. John Macpherson of Calcutta, his last hours were spent. He was now done with the world, and while preparing for his great change he desired that some of the paraphrases used in the service of the Scotch church should be read to him, and portions of Scripture. While the fourteenth chapter of St. John's Gospel was being read to him he became unconscious, and on the 15th of April, 1860, he expired.

MAIR, or **MAJOR**, **JOHN**, a celebrated name of the fifteenth and sixteenth centuries. Little of the life of this eminent person is known beyond a few incidental circumstances mentioned in his own works, and some allusions by contemporary scholars. Dr. Mackenzie and other writers not to be depended on have stated, without reference to any authority, that he was born in the year 1469. His birthplace, by his own account, was the parish of North Berwick, and is said to have been at the village of Glegghorn. In the early part of the sixteenth century he became a member of Christ's College in Cambridge.¹ "In this post," says Bishop Nicholson, "he seems to have written his history, which, as he acknowledges, was penned in the year 1518, the seventh of King James V.'s age."² Mackenzie says he left Paris immediately on having written his history, and in the year mentioned we know him to have been in Scotland, as he was then incorporated a member of the university of Glasgow, and bore the titles of Canon of the Chapel Royal and Vicar of Dunlop, while he

is termed "Doctor Parisiensis."³ In 1521 the same authority shows him to have been professor of theology in Glasgow, and one of the "intrans" and "deputati rectoris;" probably performing in the latter capacity the duties now performed, or presumed to be performed, by the assessors of the rector. During that year his well-known work *De Gestis Scottorum* was published in Paris by Badius Ascensius, the same person who afterwards published the history of Hector Boece. He is said by Bayle to have written "*stylo Sorbonico*," a characteristic not intended as a compliment. The Latinity of this work has been censured by scholars; but the matter which it clothes, if not likely to repay a reader of the present age for the labour of perusal, presents us with much contempt of prejudices common to the age; considerable knowledge of the grounds of historical truth, and a mass of curious information, sometimes of that petty and domestic nature which is valuable because it is so generally omitted by others. His notices of the state and value of provisions and of local customs might be valuable to the political economist and antiquary. He has shown much sound sense in rejecting a mass of the fables narrated by his precursors in history, Wyntoun and Fordun, believing the tale of Gathelus coming from Greece to have been invented for the purpose of excelling the English who brought their "Brute" or "Brutus" from Troy, the Greeks being, as all history and poetry must testify, a far more respectable source of ancestry than the Trojans. Of the race of kings, amounting to about forty-five, betwixt Fergus I. and Fergus II., now blotted from the list, he mentions, and that but slightly, only three or four. On this subject Dr. Mackenzie, who wishes to speak favourably of the subject of his memoir, while he has a still higher respect for the antiquity of his native land, remarks, in a tone of chagrin, "In his account of our monarchs, of fifteen kings that he only acknowledges to have been between Fergus I. and II., he mentions not above three or four of them; and it plainly appears," continues the doctor, drawing the proper deduction, "from the whole tract of his history, that it was not drawn out of ancient and authentic monuments, for he cites none of them but from the historians above quoted."⁴ The views of civil liberty inculcated in this work surprise us when we consider the period and state of society at which it was written, and they would certainly at the present juncture be termed philosophically just. If a man of so original a mind as Buchanan may be supposed to have derived his political sentiments from an inferior genius, it is not improbable that the doctrines of kingly power so beautifully illustrated in the dialogue *De Jure Regni apud Scotos* may have been imbibed from the doctrines inculcated by Major, under whom Buchanan studied logic. The doctrines of Major are more boldly and broadly, if not justly, laid down than those of Grotius.⁵ Although a churchman, he was likewise peculiarly

¹ He afterwards went to the university of Paris. Mackenzie, who has corrected his life of Major in the preface to his work, on the ground of some communications received from Paris, says he joined the university in 1493, and became Master of Arts in 1496. "Mr. John Harvey," continues this authority, "a Scotsman, and bursar or fellow of the Scots College, being then rector of the university of Paris, he passed through all the honourable places of the faculty of arts, being first procurator and then quæstor; and designs himself thus in the Register, 'M. Joannes Mair, Glegghornensis, Diocesis S. Andree.' He was made Doctor of Divinity in 1508."—Mackenzie's *Lives*, vol. ii. Preface vii.

² *Scottish Hist. Library*, 103.

³ According to the records of the university of Glasgow, in the Notes to Wodrow's *Biographical Collection*, printed some years ago by the Maitland Club, it is said that in the year 1518 "Egregius vir dictus Joannes Majoris, Doctor Parisiensis, ac principalis Regens collegii et pedagogi dicti universitatis, Canonicusque capelle regie, ac vicarius de Dunlop," &c., was incorporated along with forty-three others.

⁴ Mede, Caxton, and Froissart are Major's chief authorities.

⁵ One passage is peculiarly striking, and had the effect of published opinions been better known at the period, might have brought persecution on the head of the author: "Populus liber primo regi datus robur, cujus potestas a toto populo dependet, quia aliud jbs Fergusius primus rex Scotia non habuit: et ita est ubi, et ab orbe condito erat communiter." Continuing the train of reasoning he concludes, "Tertio arguitur ad eandem conclusionem probandum: regem et posteros pro demeritis populus potest exautorare sicut et primo instituire." p. 175.

unfettered in his clerical opinions. He condemned the monkish profuseness of David I., that "sair saunt to the crown;" and in a work entitled *Disputationes de Potestate Papæ et Concilii*,¹ he afterwards uncanonically argued the necessity of excluding all spiritual dignitaries from authority in matters temporal. Mackenzie, in his corrected statement, continues, "he remained in Scotland about five years, and taught theology in the university of St. Andrews." At what time he joined that university it would be difficult to discover, but it appears that he was connected with the university of Glasgow until the year 1522, when he receives in the record the several titles already attributed to him, and with the addition of "Theologiæ Professor" and "Thesaurus capellæ regiæ Strevelinensis."² He was, however, assuredly professor of theology in St. Andrews in the year 1525, as Buchanan is said in his life, either written by himself or by Sir Peter Young, to have then studied under him in the college of St. Salvador. The celebrity of his lectures had attracted the poet's attention; and, whether as a pupil of Major or to fulfil his previous intentions, he followed his teacher to France. The connection was the cause of an accusation of ingratitude against Buchanan. Buchanan had afterwards penned an epigram on Major, in which he turned his name to the bitter qualification, "Solo cognomine Major." It is probable that the opportunity of so apt a witticism was the sole motive of Buchanan; but Mackenzie and Christopher Irvine maintained that Buchanan had been fed both in mind and body by the charity of Major, who had procured him a professorship in the college of St. Barbe. "He who had eat his bread," observes the latter, "and lived under his discipline, both in St. Andrews and in the Sorbon, the space of five years, might have afforded him an handsomer character than *Solo cognomine Major*;" and concludes, "but I leave these wretches to the care of the great accuser, and go to my business."³ There appears to be no other foundation for the charge but the inferences which may be drawn from a passage in Buchanan's life, which does not express such a meaning.⁴ Mackenzie states that Major remained in Paris till 1530. Unfortunately little is known of the circumstances of his life during that period, nor will our limits permit an investigation among continental authors, which might provide useful matter for a more extended memoir. We know, however, that his fame was extensive and well supported. He has received high praise from such bibliographical writers as Dupin, Bellarmin, and Vossius. He is alluded to by some of his countrymen with less praise; and Leslie and Dempster, probably displeased at his view of the antiquities of his native country, sneer at the barbarism of his style. Major was probably one of the latest commentators on that universal text-book, the *Sentences of Peter Lombard*. In 1519 he had published *In Libros Sententiarum Primum et Secundum Commentarium*—a work which has passed to oblivion with its subject. In 1521 he published an introduction to Aristotle's *Dialectics*, and in 1529 *In Quatuor Evangelia Expo-*

sitiones *Luculentæ*, being a discussion on the arrangement of the Gospels as to date. Mackenzie mentions that he returned to Scotland in 1530, and taught theology at St. Andrews "till he came to a great age; for in the year 1547, at the national council of the Church of Scotland at Linlithgow, he subscribed, by proxy, in quality of dean of theology of St. Andrews, not being able to come himself by reason of his age, which was then seventy-eight, and shortly after he died."

Anthony Wood has discovered from a manuscript note of Bryan Twyne that Major was at some period of his life at Oxford, but in what house is unknown, "unless," says Bishop Nicholson, "in Osney Abbey, whose melodious bells he commends." If we could suppose Wood to have mistaken a century, the following might apply to the subject of our memoir during the year when he is said by Mackenzie to have gone to France. Speaking of St. John's school belonging to St. John's Hospital, he says, "All that I find material of this school is, that it, with others of the same faculty, were repaired by one John Major, an inceptor in the same faculty, anno 1426."⁵

MAITLAND, SIR RICHARD, of Lethington, the collector and preserver of our early Scottish poetry, and himself a poet of no mean rank, was the son of William Maitland of Lethington and Thirlstane, and Martha, daughter of George Lord Seton. He was born in the year 1496; but his father having perished at the calamitous battle of Flodden, he was at an early period of life deprived of paternal guidance and instruction. After going through the usual course of academical education at St. Andrews, he repaired to France, then the resort of all young Scotsmen of rank, and more especially of students of law. The time of his return is altogether unknown: he is supposed by one of his biographers⁶ to have been absent from his native country during the earlier part of the minority of James V.; or if he did return previous to that period, his name is not connected with any of its turmoils. Before his departure from Scotland he is believed to have been connected with the court of James IV. We are at all events certain that on his return he was successively employed by James V., the regent Arran, and Mary of Lorraine. To his services during the regency of the latter he alludes in his poem on *The Queen's Arryvale in Scotland*:—

Madam, I wes trew servand to thy mother,
And in hir favour stude ay thankfullie
Of my estait, als weil as any other.

A passage in Knox's *History* has attached some suspicion to the good name of Sir Richard at this period of his life. He is alleged to have been instrumental in procuring, for bribes, the liberation of Cardinal Beaton from the custody of his kinsman, Lord Seton. Of his share in the guilt of this transaction, such as it is, no proof exists; while there is something very like direct evidence that he was attached to the English and Protestant party, and consequently, in favouring Beaton, would have been acting against sentiments which the most of men hold sacred. That evidence consists in an entry in the Criminal Record to the following effect:—"Richard Maitland, of Lethingtounne, found George Lord Seytounne as his surety, that he would enter within the castle of Edinburgh, or elsewhere, when and where it might please the lord-governor, on forty-eight hours' warning; and that the said Richard shall remain a good and faithful subject, and remain within the kingdom,

and have no intelligence with our ancient enemies the English, under the pain of £10,000."¹

We soon after find Sir Richard engaged in diplomatic transactions for the settlement of the borders. In 1552 he was appointed, along with others, to make a division of what was called the debatable land, which division was ratified in the following November;² and in 1559 he was nominated in a commission of a similar nature. The result of the last was the conclusion of the treaty of Upsetlington.

In 1563 he was appointed one of the commissioners to decide on the application of the act of oblivion; and in the month of December of the same year, to frame regulations for the commissaries then about to be established for the decision of consistorial causes.

While he was thus employed he was also rising rapidly in the profession which he had more peculiarly adopted. He is mentioned on the 14th of March, 1551, as an extraordinary lord of session; and about the same period, or soon afterwards, he received the honour of knighthood. Ten years afterwards (12th November, 1561) he was admitted an ordinary lord, in the room of Sir William Hamilton of Sanquhar; and on the same day his son, William Maitland, was received as an extraordinary lord, in place of Mr. Alexander Livingston of Dunipace. Sir Richard was soon afterwards made a member of the privy-council; and upon the 20th of December, 1562, appointed lord privy-seal, which office he resigned in 1567 in favour of his second son, John, then prior of Coldinghame, and better known by his subsequent title of Lord Thirlstane. When we consider that these appointments were bestowed on Sir Richard in circumstances that seemed to oppose an almost insurmountable barrier to the performance of their duties, they will be considered as the most decided proof of the estimation in which he was held as a good man and an able lawyer. It does not exactly appear whether his health had been impaired by the performance of the duties of his various and important offices—it is only certain that about this period he had become blind. This calamity must have overtaken him before October, 1560, and most probably after his last appointment as a commissioner for the settlement of border disputes, in 1559. The allusion to it in his poem on *The Queen's Arryvale in Scotland* (which must have been written in the latter part of 1561) is clear and unquestionable:—

"And thoch that I to serve be nocht sa abill

As I wes wont, *because I may not see;*

Yet in my hairt I sall be firme and stabill

To thy Hienes with all fidelitie,

As prayan God for thy prosperitie," &c.

The state of the administration of the laws at this period was sufficiently deplorable. The nobles and barons, while they assembled in parliament for the purpose of making statutes, felt no scruple in breaking them, on the most trifling occasions, and then appearing, when called to the bar of justice, surrounded by armed followers. So common, indeed, did this practice become, and so little regulated by the goodness or badness of the cause, that when some of the reformers were cited before Mary of Lorraine, the queen-dowager and regent of Scotland, a large body of their friends assembled to accompany them to Stirling, where the queen then was; and it was not till a promise of pardon (which was in the most unprincipled manner immediately violated) had been given, that they could be prevailed on to dis-

perse. In like manner, when the Borderers or Highlanders extended their depredations beyond their usual limits, it was necessary that an army should be assembled for their suppression; and if the king did not accompany it in person, the command was given to some nobleman of high rank. In most cases the nobles were by far too powerful to fear the most energetic measures of a government which, receiving as yet no support from the people, depended upon themselves for its very existence. Feeling their inability to punish the real criminals, the king and his ministers frequently wreaked their vengeance on some unfortunate individual, who, though far less guilty than his feudal lord, was too feeble to oppose the ministers of the law. In such cases the wretched criminal was prevailed upon by intimidation, perhaps in many cases where the necessary proof of guilt could not be adduced, to "come in the king's will"—a phrase meaning to submit without condition to the royal mercy—or the jury were terrified into a verdict, the nature of which no one can doubt, by the threats of the king's advocate to prosecute them for wilful error, if they did not comply. No one who has looked into the publication of the *Criminal Trials and other Proceedings before the High Court of Justiciary*, by Mr. Robert Pitcairn, will accuse us of over-colouring the picture which we have now drawn. "In truth" (to quote the words of an admirable review of that work, supposed to be one of the last critiques from the pen of Sir Walter Scott), "no reader of these volumes—whatever his previous acquaintance with Scottish history may have been—will contemplate without absolute wonder the view of society which they unveil; or find it easy to comprehend how a system, subject to such severe concussions in every part, contrived nevertheless to hold itself together. The whole nation would seem to have spent their time, as one malefactor expressed it, 'in drinking deep and taking deadly revenge for slight offences.'"³ That the judges themselves, if not exposed to the fury of the more lawless part of their countrymen from the unpopular nature of their office, were not at least exempted from it by its sacred character, the subsequent part of this sketch will sufficiently show.

Setting out of the question the calamitous nature of Sir Richard Maitland's malady, and his country's loss from being deprived of his more active services, his blindness may be supposed to have contributed much to his peace of mind. The transactions of this unhappy period—the murder of Darnley—the queen's marriage with Bothwell—and all the subsequent events of the different regencies—are too well known to require notice here. But although the venerable knight did not engage in these transactions, he was not spared the pain of having his lands ravaged and his property forcibly kept from him. His lands of Blythe were overrun by the border robbers,⁴ as we know by his poem entitled *The Blind Baron's Comfort*, in which he consoles himself for his wrongs, and puns upon the name:—

"Blynd man, be blyth, althocht that thou be wrangit;

Thocht Blythe be herreit, tak no melancholie."

Happy indeed must have been the man who, dismissing from his mind the misfortunes of his lot, could devote it to the pursuits of literature; and who,

² See *Quarterly Review*, No. 88, p. 470.

⁴ This was not the first time that his property had been destroyed or carried off. "Wpon the xiiij day" of September, 1549, "the Inglismen past out of Haddingtoun, and brunt it and Leidington, and passed away without any battell, for the pest and hunger was rycht evill amangis tham, quha mycht remayne na langer thairin."—*Diurnal of Occurrents in Scotland*, printed by the Bannatyne and Maitland Clubs, p. 48.

estimating the good things of this world at their real value, could at the same time cultivate the temper here exhibited.

It seems to have been about the same time that the king's party took possession of the castle of Lethington, which had been the temporary abode of the secretary Maitland, and a ready justification of this violent measure was found in the conduct of that statesman. After the death of the son the enmity of the regent Morton was transferred to the aged and unoffending father, and his house and lands were still violently withheld from him. Although Sir Richard appears to have requested the intercession of the English court, and for that purpose to have transmitted a representation to Lord Burleigh, the queen, with her usual crafty and cautious policy in regard to Scottish affairs, did not interfere: the document is thus marked—"This must be well considered before anything is done." It was not, therefore, till the fall of Morton that the worthy knight obtained restoration of his lands. He did not, however, droop into despondency during the long period of eleven years that he was thus "wrangit." In that period his poem of *Solace in Aige* is believed to have been written. It concludes thus:—

"Thocht I be sweir to ryd or gang,
Thair is sumthing I've wantit lang,
Fain have I wald
Thaim punysit that did me wrang,
Thought I be auld."

Some attempt seems to have been made by Sir Richard to obtain compensation at least for his losses. There is extant a list of "the guidis tane frae ye ald laird of Lethingtoun of his awin proper geir forthe of Blythe and ye Twlloows;" but it is to be feared that his endeavours were unsuccessful. At a later period of his life he renewed his application for compensation; and, although he obtained an act of parliament recognizing his claims, and rescinding an act made in favour of Captain David Hume of Fishwick, who had possessed Lethington, and intromitted with the rents of that estate, the benignity of his temper warrants our supposing, in the absence of historical evidence, that he did not pursue his rights with any violent or revengeful feelings.

The age and infirmities of Sir Richard now appear to have incapacitated him in a great measure for the performance of his duties as a judge. Throughout his career the conduct of his brother judges towards him was marked by the utmost kindness and sympathy for his distressing malady. As early as January, 1561, they had ordered the macers "to suffer one of the old laird of Lethintone's sonnes to come in within all the barres as oyr prows, doe, and to issue as they doe, for awaiting on his father for the notoriety of his father's infirmity;" and he now (3d of December, 1583) obtained leave to attend court only when he pleased, with the assurance that he "should lose no part of the contribution in consequence of absence." In May, 1584, he was further exempted from the examination of witnesses, "provyding he cause his sone (Thirlstane), or his good-son the laird of Whittingham, use the utter tebletooth for him in calling of matters, and reporting the interloquitors as use it." When he was at last under the necessity of retiring altogether from the bench, it was under circumstances which no less strongly show the public estimation of his character. He was allowed the privilege of nominating his successor—a privilege of the extension of which Lord Pitmedden considers this as the first instance. Accordingly on the 1st of July, 1584, he resigned in favour of Sir Lewis Bellenden of Auchnoull, being now, as his majesty's letter to the court expresses, "sa

deblilitat that he is not able to mak sic continual residens as he wald give, and being movit in conscience that, be his absence, for laik of number justice may be retardit and parteis frustrat." At length, after a life, certainly not without its troubles, but supported throughout by the answer of a good conscience and by much natural hilarity, he closed his days on the 20th of March, 1586, at the venerable age of ninety. Living in an age marked, perhaps more strongly than any other in our history, by treachery and every vice which can debase mankind, he lived uncontaminated by the moral atmosphere with which he was surrounded, and has had the happiness—certainly not the lot of every good man—of being uniformly noticed, whether by friends or enemies, by his contemporaries or by posterity, with the highest respect. There is but one exception to this general tribute to his virtues—the accusation, in John Knox's *History*, of his having been bribed to allow Cardinal Beaton to escape from imprisonment. The foundation of this charge is, however, doubtful; for although the candour and accuracy of Knox's history cannot be impeached, it may still be admitted, from the peculiar position of the parties, that the historian's mind was liable to receive an erroneous impression of Maitland's conduct.

The works of Sir Richard Maitland exhibit him in the characters of a lawyer, a poet, and a historian. Of the work belonging to the first of these classes it is only necessary to say, that it consists of "Decisions from the 15th December, 1550, to the penult July, 1565;" being a continuation of the body of decisions known by the title of *Sinclair's Practicks*, and that a copy of it, with the additions of the Viscount Kingston, is preserved in MS. in the library of the Faculty of Advocates. His poetical collections consist of two kinds—those works which were merely collected by him, and specimens of which have long been before the public—and his own poems, the greater portion of which have not been printed till a very late date.

If it be true, as has been often asserted, that the habits and feelings of a people are best known by their poetry, surely the collectors in that department of a nation's literature are entitled to no inconsiderable portion of its gratitude. The labours of Asloan, Maitland, and Bannatyne have especial claims on our attention, as in them are to be found nearly all that remains of the Scottish poetry composed before their times. Of the first, John Asloan—whose collections are preserved in the Auchinleck library, but unfortunately in a mutilated state—little or nothing can be ascertained; and of George Bannatyne a notice has already been given in this Work. Our attention must therefore be directed to the collections of the subject of this memoir.

Sir Richard Maitland appears to have been engaged in forming his collections of poetry before he became blind—probably about the year 1555; and although one of the volumes is dated 1585, it is conjectured that it was the arrangement of them only that could have been the work of his later years. The collections consist of two volumes,—a folio comprehending 176 articles, and a quarto of 96 pieces; the latter in the handwriting of Mary Maitland, Sir Richard's daughter. They are now preserved in the Pepysian Library, Magdalene College, Cambridge; but from the regulations prescribed by the founder of that institution, they cannot be consulted except within its walls, and although its officers afford every facility which their duty permits, it must be a subject of regret to every lover of Scottish poetry that they are not in a more accessible situation. It is true, indeed, that in 1784 or 1785

Mr. Pinkerton was furnished by Dr. Peckhard with all the means of consulting them with advantage, and that he published selections from them in his *Ancient Scottish Poems*; but the charges of interpolation which have been brought against him must make his work a subject of doubt and suspicion.

Sir Richard Maitland did not produce any of his own poems at the period when ardour of mind or ambition for distinction may be supposed to prompt men to enter that walk of literature. They were all written after his sixtieth year. They are the tranquil productions of age, and of a mind regulated by the purest principles. The subjects, too, correspond with the age at which they were written,—most of them being of a moral or historical description. By far the most frequent subjects of his poems are lamentations for the distracted state of his native country—the feuds of the nobles—the discontents of the common people—complaints “aganis the lang proces in the courts of justice”—“the evillis of new found lawis”—and the depredations “of the border robbers.” Not the least interesting of his productions are those which he entitles satyres: one of these, on *The Town Ladies*, in particular presents us with a most curious picture of the habits and dispositions of the fair sex in his day, and amply demonstrates that the desire of aping the appearance and manners of the higher ranks is by no means the peculiar offspring of our degenerate age. Sir Richard’s poetical writings were for the first time printed in an entire and distinct form in 1830 (in one 4to volume) by the Maitland Club, a society of literary antiquaries taking its name from this distinguished collector of early Scottish poetry.

It may probably be unknown to most of our readers that a poet from whose mortal sight the book of knowledge was no less shut out than from the eye of the poet of *Paradise Lost*, has also written a poem on the subject of—

“Man’s first disobedience, and the fruit
Of that forbidden tree, whose mortal taste
Brought death into the world and all our woe.”

Except in the subject, however, there is no resemblance between the *Paradise Lost* of Milton and Sir Richard Maitland’s *Ballad of the Creatioun of the World, Man his Fall and Redemptioun*. From the latter poem the following passages are selected:—

“God be his word his work began,
To forme the erth and hevin for man,
The sie and watter deip;
The sone, the mune, the starris bricht,
The day divydit frome the nicht,
Thair cours for to keip;
The beistis that on the grund do mufe,
And fische in to the sie,
Fowlis in the air to fle abufe,
Off ilk kind creat hee;
Sum creeping, sum sleiting,
Sum fleing in the air,
So heichtly, so lichtly,
In moving heir and thair.

The workis of grit magnificence,
Perfytet be his providence,
According to his will;
Nixt maid he man; to gif him gloir,
Did with his ymage him decoir,
Gaif paradise him till;
Into that garding hevily wrocht,
With plesouris mony one;
The beistis of every kynd war brocht,
Thair names he sowld expone;
Thame nemming and kemnyng,
As he list for to call;
For plesing and eising
Of man, subdewit thame all.

In hevily joy man so possesst,
To be allone God thoct not best,
Maid Eve to be his maik;
Bad thame incress and multiple;
And eit of every fruit and trie,
Thair plesour thay sowld taik,

Except the trie of gud and ill,
That in the middis dois stand;
Forbad that thay sowld cum it till,
Or twiche it with thair hand;
Leist plucking or lucking,
Baith thay and als thair seid,
Severily, awsteirly,
Sowld dye without remeid.”

The poem thus concludes:—

“Behald the stait that man was in,
And als how it he tynt throw sin,
And loist the same for ay;
Yit God his promeisss dois performe,
Send his Sone of the Virginie borne,
Oure ransome for to pay.
To that grit God let us gif gloir,
To us has bene so gude,
Quha be his death did us restoir,
Quhairfof we war denude;
Nocht karing nor sparing
His body to be rent,
Redemyng, relieving,
Ws quhen we war all schent.”

The historical writings of Sir Richard Maitland were the productions of an earlier period than his poems. The principal historical work of Sir Richard that has come down to us is *The Historie and Cronicle of the Hous and Surname of Scytoun*, to the Moneth of November, in the Yeir of God, Jm. Vc. lix. yeiris; collectit, gaderit, and set furth be Schir Richart Maitland of Lethingtoun, Knycht, Dochteris Sonn of the said Hous.” This work was printed in 1829 for the Maitland Club. Another of his works bears the following title: “*Heir followis ane Brief and Compendious Tabill or Catholog of the Names of the Kingis of Scotland, France, and Ingland, with the Dait of thair Reignis*; togidder with the Successioun of King Malcolme Caimmoir, and of all Kingis of Scotland sensyn, to the Dait heirof; quham thay mareit; quhat Successioun they had; with quham they war allyat. Collectit, gatherit, and set furth be Sr. Richart Maitland of Lethingtoun, Knyt. The Yeir of God, Jm. Vc. and Three Scoir Yeiris, the xiiij Day of the Moinethe of October.”

By his wife Mary, daughter of Thomas Cranston of Corsby, Sir Richard Maitland had a numerous family. It is said that he had seven sons, three of whom—William, John, and Thomas—rose to eminence; and four daughters—Helen, married to John Cockburn of Clerkington; Margaret, to William Douglas of Whittingham; Mary, to Alexander Lauder of Hutton; and Isabel, to James Heriot of Trabroun.

MAITLAND, SIR WILLIAM, of Lethington. This remarkable statesman, who in his day played many parts, and was “everything by fits, but nothing long,” appears frequently in these pages in consequence of his connection with the principal characters and events of the Scottish reformation and the reign of Mary Stuart. But as such fragmentary features are insufficient to give a full idea of the man, we prefer, at the risk of repetition, to collect these into a single narrative, so that the reader may have a distinct portrait of the notable Maitland of Lethington.

Of the early history of Sir William Maitland little has been recorded. He was the eldest son of Sir Richard Maitland, of whom a notice has been already given, and was born about 1525. After completing his education at the university of St. Andrews he visited the Continent, where he studied civil law, and on his return to Scotland was characterized by Buchanan as “a young man of consummate ability and great learning.” He had also embraced the doctrines of the reformers, and was among the few who attended the ministry of John Knox when the

reformer returned from Frankfort to Scotland in 1555. He was among those convertites, however, who endeavoured to reconcile their religious opinions with their political interests by conforming to a certain extent to the outward usages of Popery. Such selfish truckling, however, could find no favour in the eyes of Knox, who attended a meeting of the principal delinquents to reason against it and denounce it. The question at issue was the harmlessness of attendance at the mass, and Knox refuted every argument adduced in favour of the practice. His reasoning was so conclusive, that, at the close of it, Maitland said of the arguments by which his party endeavoured to justify their attendance, "I see perfectly that these shifts will serve for nothing before God, seeing they stand us in so small stead before men." It was resolved that their compliance with the observances of Popery, upon whatever plea of expediency, was sinful and idolatrous.

In the war which afterwards ensued between the lords of the congregation and the queen-regent, Maitland was secretary to the queen. Even in this courtly situation, however, and surrounded by the zealots of the Popish party, he was unable to conceal his Protestant predilections; and finding his life in danger on account of the freedom with which he had expressed his religious opinions, he secretly withdrew from Leith, and joined the lords of the congregation, who at that time were besieging the town. Their attacks, however, had been so ill-concerted and so unsuccessful, that they had altogether lost heart, and in spite of the representations made to them by their new ally of the danger that would ensue on their raising the siege, they retreated to Stirling. Here they were roused from their despondency, and inspired with fresh courage, by the eloquence of Knox, and at his suggestion they sent William Maitland to request assistance from the Queen of England. In his instructions he was directed to represent how the French, by fortifying towns and placing garrisons in Scotland, evidently sought the subversion both of the liberties and Protestantism of the country, and that if they could accomplish this, they would acquire greater facility in effecting the same change in England. Maitland performed his part so effectually that English aid was granted, and the power of the two nations combined soon compelled the French to forego their footing in Scotland.

The next important public movement was for the return of Mary Stuart, the young queen, from France; and previous to this event there was a meeting of parliament to establish the religion of the country upon the principles of the Reformation, to draw up a public confession of faith, and assign a necessary support to the ministry of the infant church. These were the great political questions of the day, and their importance was increased by the well-known fact that their young sovereign was a Papist, and that her powerful uncles the Guises were the devoted champions of the popedom. At this critical period, and while the parliament was sitting, John Knox in Edinburgh preached upon the prophecies of Haggai, in which these momentous subjects were supposed to be involved, and preached with his wonted energy and boldness. But the idea of building up and endowing a new church, especially from the materials of the old, which were already regarded as a spoil for the strongest hand, was distasteful to not a few; and Maitland sneeringly remarked, in reference to the doctrines announced by the preacher, "We must now forget ourselves, and bear the barrow, to build the house of God." Already the subtle politician was showing his hostility to the reformer. On

the return of Mary to her Scottish throne, the chief leaders among the lords of the congregation were inclined to concede to her the private exercise of her religion, and especially the celebration of the mass, and among these Maitland was conspicuous. After a discussion with Knox and the principal clergy on the question, it was resolved to settle it by a consultation with the church of Geneva, and the reformer himself offered to write the necessary letters for the occasion. But here Maitland interposed, and after expatiating upon the necessity of conveying impartial information on the subject, he offered to write the necessary missives himself. His offer was accepted, and this was all that he wanted: a delay was gained, the missives were not sent, and all ended in a free permission for the queen to enjoy the rites of her own religion.

After the queen's arrival and settlement in Scotland, the third General Assembly of the reformed church was held in December, 1561. But General Assemblies had already become odious to the court as a separate and rival power, and it was alleged that it was unlawful to hold them without the knowledge of the sovereign. It was answered that these very meetings were appointed by the Book of Discipline, which most of them had subscribed with their own hand previous to the queen's arrival; and as for the queen, that she knew there was a reformed kirk within the realm, which had its own government and appointed times for assembling. "The queen knows this well enough," replied Lethington, now the spokesman of the court, "but the question is, whether the queen allows such conventions." He was answered, that if the liberty of the church depended upon the queen's allowance or disallowance, they should be deprived not only of assemblies, but the public preaching of the gospel. "Take from us," added the speaker, who was Knox himself, "the freedom of assemblies, and take from us the evangel; for without assemblies how shall good order and unity in doctrine be kept?" His reasoning prevailed with most of the nobles and barons present, and it was agreed to advise the queen, that if she was jealous of anything to be discussed in the assembly, she might appoint persons to attend and hear it.

It was next proposed that the Book of Discipline should be ratified by the queen herself; but Maitland sneered at the proposal, and asked how many of those who had subscribed to it would obey it? It was answered, "All the godly." "Will the duke?" said Lethington, alluding to Chastelherault, the highest peer in the realm. "If he will not," replied Lord Ochiltrie, "I wish he were expunged not only from that book, but from our number and company; for to what purpose shall pains be taken to set the church in order if it be not kept, or to what end shall men subscribe if they never mean to perform?" This home-thrust Maitland endeavoured to parry with a frivolous jest: "Many subscribed *in fide parentum*, as the bairns are baptized." "You think that stuff proper," said Knox indignantly, "but it is as untrue as improper. That book was read in public audience, and the heads thereof reasoned upon divers days, as all that sit here know very well, and yourself cannot deny: no man therefore was desired to subscribe that which he understood not." Maitland was foiled, but he was aware notwithstanding that the queen would never ratify the Book of Policy. The next question to be settled was a provision for support of the reformed ministers out of the church lands and revenues, when it was reluctantly conceded that two parts should go to the late clergy, and the remaining third part be divided between the ministers and the queen. Shocked at

this unjust decision, Knox denounced it in the pulpit, declaring that two parts would be given to the devil, and a third part divided between God and the devil. To this he added, "Ere it be long the devil shall have three parts of the third, and judge you then what God's portion will be." Incensed by this severe truth, Maitland affirmed that the ministers being supported, the queen at the year's end would not get enough to buy her a pair of new shoes. Being appointed along with some other state officials to modify the stipends assigned to the clergy out of the third part of the church property, he took care that the share of the ministers should be of the smallest; and when they complained of a parsimony that reduced them and their families to all but starvation, he pretended to be astonished at their ingratitude. "These men get so much yearly," he said, "and yet they are so thankless, that they have not even said to the queen, 'Gramercie.'" He was reminded that there was no need of such acknowledgment, as they received nothing gratis from the queen; that even her claim to a share of the third part was a usurpation, and had no better right than that of the soldiers to the garments of our Lord when they crucified him; "nay, the partition is not so humane," it was added, "for the soldiers did not take his garments until he was crucified, but the queen and her flatterers parted the spoil while Christ himself is preaching among us."

Soon after the arrival of Mary in Scotland, it was judged necessary to send an ambassador to England; and as Elizabeth had several grounds of offence against the Queen of Scots, the choice of the messenger was an affair of some importance. The duty was, in this case, devolved upon Maitland of Lethington, who gladly undertook so congenial an office. On arriving at the English court he found Elizabeth in a state of high resentment, which the chief object of his message did not tend to soften. It was, that Mary should be declared the heir-apparent and successor of the Queen of England at the next meeting of her parliament. At this Elizabeth fired up, and after a statement of grievances political and personal which she had sustained at the hands of her cousin, but which she was disposed for the present to overlook, she announced that declaration to which she adhered to the very hour of her death. Successor she would declare none. Instantan people regarded more the rising than the setting sun; and confirmed successors were too apt to assume present rule, instead of waiting until the proper time arrived. "I will not be so foolish," she added, "as to hang a winding-sheet before mine own eyes, or to make for myself a funeral feast while I am alive." She thus distinctly announced the great principle of her policy, and Lethington was the man to avail himself of the knowledge. He also obtained, by the very magnitude of his demand, as much as he hoped to get, and more than could have reasonably been expected. Mary was to abstain from using the royal arms of England and the title of Queen of England and Ireland during the lifetime of Elizabeth, or any of her children. On the other hand, Elizabeth engaged that neither she, nor any children whom she might have, would do anything to prejudice the rights of Mary, or impair her title to the succession.

In embracing the cause of the Reformation, Maitland appears to have adopted it on the principle of political expediency as much as from serious conviction: it was a prosperous European movement, in which new but able men might rise to place and power, and supersede the old aristocracy as well as the old religion in Scotland, as they had done in other reformed countries. This may explain not

only his religious zeal, but his diligence to depress the clergy, and make them dependent upon the state, and upon statesmen like himself. For the present he was devoted to the interests of the Earl of Moray, the leading nobleman of the day, who greatly prized the other's political talents, and to the caprices of the queen, to whom he was secretary; but when the time arrived, he showed that he could dispense with the favour of either, and set up on his own account. The time, however, was not yet, and he accompanied the queen and earl in their progress to the north, that ended in the battle of Corrichie. This century was a strange exciting period, in which religious feeling was often displayed by the most unlikely persons, and in very uncongenial enterprises; and there were two men who, before the battle joined, made themselves conspicuous by their public devotion. The one was the Earl of Huntly, who by this rebellious outbreak was seeking to procure the death of the Earl of Moray, and the imprisonment of the queen, for the purpose of compelling her to marry his own son. The hoary sinner, at the sight of the queen's armed array, went down upon his knees, and thus prayed: "O Lord, I have been a bloodthirsty man, and by my means much innocent blood hath been spilt: if thou wilt give me victory this day, I shall serve thee all the days of my life!" The other man of prayer was Maitland, our Scottish Machiavelli. After exhorting the queen's party to call upon God, to remember their duty, and not to fear the multitude of their adversaries, he thus concluded: "O Lord, thou that rulest the heaven and the earth, look upon thy servants whose blood this day is sought, and to man's judgment is sold and betrayed. Our refuge is now unto thee, and our hope is in thee. Judge thou, O Lord, this day betwixt us and the Earl of Huntly. If ever we have sought unjustly his or their destruction and blood, let us fall by the edge of the sword. If we be innocent, maintain and preserve us, for thy great mercy's sake." As is well known, the Huntlys were defeated, and the earl killed.

After this event, in which Lethington had shown himself a stout courageous soldier, he returned to his more congenial occupation, and was sent to the Queen of England, and the family of Guise in France, to treat of his sovereign's marriage. The marriage of Mary was at present the great subject of interest in Scotland; and among the suitors for her hand all were at a loss to guess on whom her choice might fall. It was a matter of great importance, however, to Maitland, who already had got out of favour with the principal nobility, as one who too greatly favoured the queen's wishes, to the injury of the commonwealth. In this case it was necessary for his interests to secure such a king-consort as would strengthen him against his enemies. His choice was already made, and Darnley was the man whom he was labouring to promote to the high office of king-consort. His situation furnished him with opportunities to procure the recal of Darnley to Scotland; and when it was effected he said, "This day I have taken upon me the deadly feud of all the Hamiltons in Scotland, and have wrought them no less displeasure than if I had cut their throats." He alluded to the disappointment of that powerful family, whose chief, should Mary die childless, would succeed to the Scottish throne. But merely one expedient was not enough for the wily secretary; he must have two strings to his bow, so that if one broke he might have recourse to the other; and the second he selected in this instance was the notorious Earl of Bothwell, who, having been denounced as rebel in Scotland, had endeavoured to escape to

France by sea, but had been driven by stress of weather into England, and detained as a fugitive from justice. Elizabeth offered to surrender him to our queen; but the latter, instigated by Maitland, replied that he was no rebel, and desired that he might have liberty to pass whither he pleased. Bothwell was accordingly allowed to go abroad, and there he remained until affairs in Scotland were ripened for his fatal return. After Maitland's commission in England had ended he returned home, and one of his first proceedings was to favour the Earl of Athol, by which the Earl of Moray's influence was impaired, although the cunning secretary still maintained his show of regard for the latter nobleman. It was probably by his influence also, that soon after his return the queen liberated the Archbishop of St. Andrews, the deadliest enemy of Moray, from confinement.

After this an event occurred that gave ample occupation to the busy brain of Maitland. The queen in her return from one of her royal progresses, made some stay in Stirling; and during her absence her French attendants had the hardihood to have mass celebrated in Holyrood House. It was a defiance of the law, which allowed that liberty only to the queen herself, and in the residence where she was present at the time; and as if to make their act more defiant, the celebration, instead of being a private one, was upon a more public scale than when Mary herself was present. It was an insult on the part of foreigners both to the law and religion of Scotland, and a gratuitous provocation to strife and bloodshed. Such an open defiance could not be otherwise than noticed, and several Protestants were sent to the palace to take account of those persons who repaired to the rite. At their entrance the French ladies raised a shriek of alarm, and a hasty messenger was sent to the magistrates to come and save them from instant massacre. When they arrived, which they did in all haste, they found everything quiet in the chapel, and a peaceable man exhorting the worshippers not to transgress the law. The most, however, was to be made of an event which had passed over with such provoking forbearance, and two of the intruders were appointed to be tried "for forethought felony, hamesucken, violent invasion of the queen's palace, and spoliation of the same." As in such a prosecution justice was not likely to be regarded, John Knox, who had been commissioned to watch over the safety of the Protestant cause in Edinburgh, and to write "to the professors in all quarters, when danger appeared imminent, addressed to them a circular on the occasion, announcing the event as it had occurred, and the advantage that would probably be taken of it by the court party and the Papists; and entreating them to be present in Edinburgh on the day of trial, to watch and witness the proceedings. At this time the safety of Protestantism in Scotland stood in union and combination, without which it would have been a rope of sand; and its professors had been made too well aware of the truth of the principle, that the danger of one is the danger of all. On occasions also of peculiar danger, when their lives or liberties had been threatened, they had thus been called together more than once since the Reformation had commenced, without underlying the blame of rebellion or treason. But now the case was altered. The throne was occupied, the great reformer himself had convoked the queen's lieges, and if the act could be found treasonable he might be visited with the penalties of a traitor. And what a triumph for Popery both at home and abroad! The queen would be also revenged upon her enemy, and the court delivered from a formidable

censor. It was resolved by Mary and her advisers that John Knox should be tried for the crime of treasonable convocation; and to give greater weight and safety to such a trial, it was resolved to summon the nobility, that their presence might countenance the condemnation.

Of all the men of power who were thus arrayed against Knox, no one distinguished himself so greatly as Maitland, who was throughout the life and soul of the prosecution. Besides his own personal resentment at the man before whose superiority he had more than once stood rebuked, it was the best of opportunities to win the favour of the queen, and become the director of her councils. Even Elizabeth would look approvingly upon him who had brought the author of the *Blasts* "against the monstrous regiment of women" to shame; and as for the house of Lorrain, their gratitude would be unbounded. It is true that the interests of the Reformation would be sorely endangered; but might not the Reformation be better advanced by gentler measures and more compliant advocates than Knox? Even at the worst, the interests of religion would not long stand in the way of such a thorough politician as Maitland, as his subsequent career testified. His first movement was to persuade the reformer to unconditional submission, by which the odium of further prosecution would be avoided; and having obtained the concurrence of the Earl of Moray, who had begun to be alienated from Knox, they held an interview with the latter, and tried to persuade him to confess his offence, and throw himself upon the queen's mercy. Confident in his uprightness, Knox refused, and declared that he had done nothing but his duty. "But how can you defend yourself," said Lethington, "have you not convoked the queen's lieges?" "If I have not a just cause," replied Knox, "let me smart for it." "Let us hear," said they, "the grounds of your defence, for we would be glad you might be found innocent." The reformer was too wary to fall into the trap. "No," he said, "I am informed by several that I am already condemned, and my cause prejudged; therefore I might be reputed a fool if I should make you privy to my defences." Baffled by this answer, Maitland angrily departed, and Moray followed a short time after.

Four days after this interview the trial came on. The principal lords and crown-officers being assembled, the queen took her seat, and Maitland, who had previously been unable to influence the members of the court against the accused, took his place ostentatiously at one side of the royal chair, where he occasionally whispered into the queen's ear, and smilingly received her answers. She handed him a letter—Knox's circular—and on the question being asked, the latter confessed that both the composition and writing were his, and by the royal command read it aloud. The queen declared it a spiteful and treasonable epistle, and Maitland said, "Mr. Knox, are you not sorry at heart that such a letter hath escaped your pen, and from you hath come to the knowledge of others?" "My lord secretary," said Knox, "before I repent, I must be taught my offence." "Offence!" exclaimed the other; "if there were no more but the convocation of the queen's lieges, the offence cannot be denied." "Remember yourself, my lord," said Knox; "there is a difference betwixt a lawful convocation and an unlawful. If I be guilty in this, I have offended often since I came last into Scotland; for what convocation of the brethren has been to this hour to which my pen has not served? But before this time no man laid it to my charge as a crime." "Then was then, and now is now," replied the other, "we have no need of such

convocations as we have sometimes had." After some further debate Knox justified his act as done by the commandment of the kirk, an authority acknowledged by the laws of the realm, as well as by those present. The queen then shifted the ground of the charge. "You shall not escape so," she said; "is it not treason, my lords, to accuse a sovereign of cruelty?" When this had been granted by the lords, she referred to some sentences of Knox's letter upon which her charge was founded. But while many doubted what answer could be made, he showed satisfactorily that it was the persecuting spirit of Popery which he had written against, and not the natural disposition of the queen. "I add, madam," he said in conclusion, "that natures otherwise gentle and meek in appearance may, by wicked and corrupt counsellors, be subverted and altered to a contrary course. Example we have in Nero. Now, madam, I say plainly, Papists and conjured enemies of Christ have your ears patent at all times; assure your grace they are dangerous counsellors, and this your mother found."

Driven from the new ground she had chosen, the queen, after some whispering with the secretary, abandoned the charge of treason, for the less punishable one of disrespect. It was a personal and peevish charge, which she had better have omitted, or at least reported truly. "Well," she said, "you speak here fair enough before the lords; but the last time I spoke with you privately, you caused me weep many tears, and said stubbornly you counted nothing for my weeping." She alluded to her memorable interview with the reformer on the subject of her reported approaching marriage to a foreign prince—an interview of which such ridiculous representations continue to be given to this good hour. Knox in answer rehearsed the particulars of this interview, and every word that had passed on the occasion—referred the correctness of his statement to the testimony of Erskine of Dun, the only witness present on the occasion, and who could easily be cited for the purpose—and showed that in the whole matter he had spoken so temperately and respectfully, that the queen's tears could not be imputed to anything rude or harsh in his behaviour. Mary was silent, and after a whispered conference with the secretary, the latter said, "Mr. Knox, you may return to your house for this night." During the whole of this trial the conduct of Maitland had been not only unjust but impolitic. He had shown a slavish desire to gratify the queen at the expense of the reformer; and he had offended the proud nobles by his display of familiarity with her majesty and influence as a court-adviser and director. The queen having retired to her cabinet, the votes of the nobles were taken, and they all voted as one man that John Knox had not offended. Disappointed and enraged at this decision, Maitland again brought in the queen, placed her in her chair of state, and desired the court to vote anew; but this insulting attempt to overawe and coerce them by the authority of the royal presence was met by the nobles with a storm of indignation. "What, shall the laird of Lethington have power to command us?" they exclaimed. "Shall the presence of a woman cause us to offend God? Shall we condemn an innocent man against our conscience for the pleasure of any creature?" They again absolved the reformer, and praised God for his modesty, and plain and sensible answers; while the queen, Maitland, and the courtiers retired, baffled and disappointed.

The antagonism between the court and the church was daily growing in strength. It was not also a merely political, but a religious antagonism, in which two hostile creeds were at issue, and the elements

of contention were gathering for a strife which could only terminate in the entire suppression of Popery or Protestantism. Popery was still powerful in the popularity of the queen, the devotedness of the Catholic lords, and the lukewarmness of the greater portion of the reformed nobles; and matters were so equally balanced between it and the opposite party, that the sudden reverse of an hour might restore its ancient ascendancy. This trimming between the two churches, so dangerous at such a crisis, was odious to the reformed ministers, who declaimed from the pulpit against these disguises in language more honest than courtly. "Once hypocrites were known by their habits," it was thus preached; "we had men to be monks and women to be nuns. But now we cannot discern the earl from the abbot, nor the nun from the noblewoman. But seeing ye are not ashamed of that profession, would to God you had therewith the cowl, the veil, and the rest belonging thereto, that you might appear in your own colours." On hearing this sermon, Lethington declared with a curse that he would thenceforth leave the ministers to shift for themselves, let them bark and blow as much as they pleased. The signs of the times were such, that a skilful politician, throwing himself into the rising party, might rise with it to its utmost height, and in his way to such good fortune he seems to have resolved that his creed should be no obstacle. It was now a favourite assertion at court that there was no idolatry in the mass, and that they who so stigmatized it knew not what they meant—a declaration of apostasy which so deeply stirred the spirit of John Knox, that he denounced it in the pulpit with an earnestness that moved some of its advocates even to tears. But Maitland with a sneer observed, "We must recant, and burn our bill, for the preachers are angry."

This liberty of the pulpit in the sixteenth century was the same as the liberty of the press in the nineteenth: the minister of the former period commented upon public events with the same authority which is used by the journalist in the latter; and when offending individuals complained of this pulpit license in bringing their characters and doings before a congregation, the answer was, "Public offences require a public exposure." To suppress the liberty of preaching, therefore, was the same as to suppress the liberty of printing, and usually followed by similar results. Experience, however, had not as yet taught the danger of suppressing free opinion whether in speaking or writing, and the court-party had resolved to silence this license of the pulpit before a public press existed in its room. They were a formidable array, consisting of Hamilton Duke of Chastellerauld, the Earls of Argyle, Moray, Morton, Glencairn, Marischal, Rothes, the Master of Maxwell, and the principal officers of government. Their feeling was indicated by withholding their presence from the next General Assembly; and when this conduct was complained of, they desired that a deputation from the assembly should be sent to them, through whom they might explain their grievances to the brethren, instead of bringing them before the public meeting. Their wish was complied with, and Knox, aware that he was the chief subject of complaint, accompanied the deputation. As the lords were only to argue and remonstrate, not to command, the highest in talent and scholarship was necessary for such a task, and upon none so well qualified could their choice have fallen as upon William Maitland of Lethington. He opened the proceedings with a speech, gentle, temperate, and ingratiating, comprised under the following heads:—First, How much the kingdom was indebted to God,

by whose goodness it had freedom in a religion not followed by her majesty: Second, How necessary it was that through the kind offices of the church, and especially of its ministers, she should retain the opinion that they sincerely sought her welfare, and laboured to establish the good opinion of her subjects in her favour; and lastly, How dangerous a thing it was that ministers should be noted to disagree one from another in the form of prayer for her majesty, or in doctrine concerning obedience to her authority—"and in these two last heads," he added, coming to the pith of the matter, "we desire you all to be circumspect; but especially we must crave of you, our brother John Knox, to moderate yourself as well in form of prayer for her majesty as in the doctrine you propound concerning her estate, and the obedience that is due to her. Neither shall you take this as spoken to your reproach, but because that others by your example may imitate the like liberty, although not with the same modesty and foresight."

The challenge being thus thrown down, the debate commenced, of which a summary can scarcely convey a clear idea. Knox candidly expressed his opinion that in the present state of rule in Scotland, where idolatry was maintained, the servants of God despised, and wicked men placed in authority and honour, the queen scarcely deserved the praise that was claimed for her; and that as such proceedings usually brought down the judgments of God upon realms and nations, the godly in Scotland ought rather to lament and mourn. "How are you able to prove," queried Lethington, "that God ever stricken a nation for the iniquity of their prince, if the people themselves lived righteously?" Knox quoted the instance of Jerusalem and Judah, that were plagued for the sins of Manasseh, because the people, although not actively joining in his idolatry, yet tolerated it by allowance and permission. In this way all Scotland, and especially they the Protestant nobles, were guilty of the queen's idolatry. Referring this matter to subsequent consideration, Maitland next attacked the reformer's public prayers for the queen, especially in connection with her mass. "You call her," he said, "a slave to Satan; you affirm that God's vengeance hangs over the realm because of her iniquity; and what is that but to raise the hearts of the people against her?" At this an exclamation arose among the courtiers that such a style of prayer could not profit. Knox complained that his language in the pulpit had been wrested for the purposes of censure, and that the worst words he used in his public prayer were the following: "'O Lord, if it be thy good pleasure, purge the heart of the queen's majesty from the venom of idolatry, and deliver her from the bondage and thralldom of Satan, in which she hath been brought up, and yet remaineth, for lack of thy true doctrine. And let her see, by the illumination of thy Holy Spirit, that there is no means to please thee but by Jesus Christ, thy only Son, and that Jesus Christ cannot be found but in thy holy Word, nor yet received but as it prescribeth: that in so doing, she may avoid the eternal damnation which abideth on all obstinate and disobedient to the end, and that this poor realm may also escape that plague and vengeance which inevitably followeth idolatry maintained against the manifest Word and the open light thereof.' This," he added, "is the form of my common prayer, as ye yourselves can witness: now, what is worthy of reprehension in it I would hear."

Lethington declared in reply that there were three things in this prayer which had never pleased him. "You pray," he said, "for the queen with a condition: 'Illuminate her heart, if it be thy good pleasure.'

Where have you the example of such a prayer?" Knox referred to the example and authority of our Lord himself, who had given us the rule in praying to the Father, "If you shall ask anything according to his will he shall hear you," and who had taught us to pray, "Thy will be done." More than this he could not do so long as she continued in idolatry. Still however Maitland harped upon the authority of precedent, and objected, "You can produce from Scripture the example of none that so prayed before you." "Do you think," said the other, "that the apostles prayed themselves as they command others to pray?" And when the whole company replied that there was no doubt of that, Knox quoted the words of the apostle Peter to Simon Magus, and said, "Here we may clearly see that Peter joins a condition with his commandment, that Simon should repent and pray—to wit, *if it were possible* that his sins might be forgiven him. Simon," he went on, "although he had been a sorcerer, yet joined with the apostles, believed, and was baptized; and although afterwards he sinned through avarice, he humbled himself so far as human judgment could discover like a true penitent. And yet Peter doubts of his conversion. Why then," he asked, "may not all the godly justly doubt of the conversion of the queen, who hath used idolatry, which is no less odious in the sight of God than is the other, and still continueth in the same? yea, she despiseth all threatenings, and refuseth all godly admonitions?" "Why say you that she refuses admonition?" replied Lethington, "she will gladly hear any man." "But what obedience to God," said Knox, "or to his word, ensues to all that is spoken unto her, or when shall she be seen to give presence to the public preaching?" "I think never," answered Lethington, "so long as she is thus treated." "So long then," said the other, "you and all others must be content that I pray so as that I may be assured to be heard of my God—that is, that his good-will may be done, either in making her comfortable to his church, or, if he hath appointed her to be a scourge to the same, that we may have patience, and she may be bridled."

Maitland then advanced to his second ground of complaint. "Where do you find that the Scriptures call any the blind slaves of Satan, or that the prophets of God speak of kings and princes so unreservedly?" To this Knox answered at some length, while his opponent cavilled at each debatable point. After the reformer had proved satisfactorily from Scripture that all are the sons of wrath, the servants of sin, and slaves of Satan, until Christ has set them free, Maitland then asked, "Where will you find that any of the prophets did so treat kings, queens, rulers, or magistrates?" "In more places than one," said the reformer: "Ahab was a king, Jezebel was a queen, and yet what the prophet Elijah said to the one and the other I suppose you are not ignorant." "But that was not cried out before the people," replied Maitland, "to make them odious to their subjects." Knox declared that although Scripture is silent on this point, the denunciation of the prophet does not appear to have been whispered, or uttered in a corner, but spoken before witnesses, as Jehu had referred to it as a thing well known after the death of Jezebel. Thus discomfited, the secretary took refuge in the assertion, "These were singular motions of the Spirit of God, and appertain nothing to this age." In reply, Knox showed that no portion of Scripture was obsolete or of private interpretation, and thus continued: "But now to put an end to this head, my lord, the prophets of God have not spared to rebuke wicked kings as well to their face as before the people and their subjects." In

proof of this, he quoted instances from the Old Testament, where Elisha publicly rebuked his own sovereign Jehoram, and where Jeremiah was commanded to cry aloud in his denunciations both against the sovereigns of Judah and its inhabitants. "And therefore," he added in conclusion, "you ought not to think it strange, my lord, although the servants of God tax the vices of kings and queens as well as other offenders, and that because their sins are more hurtful to the commonwealth than are all the sins of inferior persons."

In this singular discussion, of which we have only attempted a summary, Maitland had evidently the worst of the argument. Learned and cunning in intellectual fence as he was, which would have made him a dangerous antagonist for ordinary theologians, he was no match for the clear and weighty logic of John Knox. Two of his heads of complaint were already scattered to the winds, and only a third remained: but would it be safe to propound it? It concerned the duty of subjects to their kings; and the maintenance of this part of the argument must have recourse to the doctrine of downright absolutism, which had never found favour in Scotland, and was not likely to be palatable to the nobles who were umpires to the debate. Maitland, who during the latter part of the lengthened controversy had been leaning upon the Master of Maxwell, complained of weariness, and shifted this part of the argument, which he declared to be the chief head, to the management of Mr. George Hay, one of the reformed ministers. Knox was contented with the change, and commended Hay for his learning and modesty; but he solemnly adjured him in such an important affair to speak according to his convictions, and not for the display of forensic dexterity. At this admonition Hay refused the debate, which therefore once more devolved upon Maitland. To the unwelcome task he addressed himself with a show of cordiality, declaring that he was better prepared upon this head than the other two; and this he soon evinced by his subtle arguments—his perplexing sophistries—and the array of authorities from the most learned of Europe in support of his positions—a collection which he declared had cost him more toil in gathering during these seven years than the reading of any commentaries. He commenced by calling in question two propositions which John Knox had announced in his preaching. The first was, that the reformer had made a difference betwixt the ordinance of God and the persons who were placed in authority, and had affirmed that men might resist the persons, and yet not offend God's ordinance. The second was, that subjects were not bound to obey their sovereigns if they commanded unlawful things; but that they might resist their sovereigns, and were not always bound to suffer.

This opened up the whole argument of the divine right of kings, and the duty of passive obedience and non-resistance on the part of the people. Maitland was strong in the spirit of the age, which still ran in favour of absolutism, while Knox in his replies embodied those principles which, however startling at the time, are now established axioms in the British constitution. On this account it is interesting to contemplate these two men as the most distinguished representatives which the age could furnish of their respective opinions; the one contending for a doctrine of government which had thousands of years for its authority—the other advocating those new principles which were still strange to Europe, but under which every kingdom successively has since been more or less regenerated. On the one hand, Maitland contended for those absolute dogmas which

were afterwards developed and brought into act by the Stuarts; while Knox was the personification of that noble Puritan spirit which resisted the tyranny of Charles I., and drove James II. from his throne. After this explanation it is unnecessary to enter into the particulars of this part of the controversy. It is enough to state that Maitland was driven from all his defences by the superior reasoning of Knox, and that the lords who had chosen him for the advocate of their cause were disappointed.

Having had enough of theological disputation, Lethington abandoned this kind of distinction, and allowed the Scottish reformation to proceed at its own pace. Other matters also were in hand that were more immediately connected with his own political and personal interests. In these, however, he only appears by fits, and at distant intervals. One of these reappearances was occasioned by the undue favour of the queen towards David Rizzio, by which his office at court was superseded, and his influence diminished; and to remedy this, he suggested to the Earl of Morton the proposal of putting the foreigner to death. Morton demurred at the proposal, upon which Maitland endeavoured to stir up such a feud between him and Rizzio as would provoke the earl into action. In the affairs of Darnley, for whose promotion he had laboured, he now appears to have taken little concern, probably foreseeing how little he could profit by such a course, and on account of the dislike into which the king-consort had fallen with the queen. When Darnley perished, and Bothwell took his place, Maitland, who found his life in danger from Bothwell's violence, forsook the queen's party, and joined the lords who were leagued against her. He still, however, kept the door open for a return to his former friends should circumstances make it expedient; and, finding the time ripened for his purpose in consequence of the strong sympathy expressed for Mary during her imprisonment in Lochleven, he rejoined her party, and wrote to her, offering his assistance. It was a letter characteristic of the style of the period, showing how available his services might be, from the apologue of the little mouse that gnawed asunder the net, by which the captive lion was set free. Nor did he confine his services to mere professions; for when the queen escaped from Lochleven, one of the chief plotters and devisers of her escape was no other than himself. At the battle of Langside he was arrayed among the barons who fought against her; but, true to his plan of double-dealing, he obtained at the following parliament remission for many of the queen's party who had been at the battle, but had not afterwards submitted to the government. In consequence of his advice a few only were condemned; and this lenity, instead of conciliating, only encouraged the obstinacy of the queen's party and protracted their resistance.

These shifty proceedings, although so cunningly conducted, could not escape the suspicions of the regent Moray, so that when the latter was summoned to England to justify his proceedings against his sovereign, he selected Maitland of Lethington as one of the commissioners by whom he was to be accompanied. It was truly dangerous to take such a man upon such a mission, but the regent was now aware that it would be still more dangerous to leave him behind. When the commissioners of the two kingdoms met at York, the Duke of Norfolk, the head of the English commission in this trial or inquest, astounded the Scottish regent and his party by insisting, as a preliminary, that they should do homage in their young king's name to the supremacy of the English crown. That this obsolete claim

should have been revived on such an occasion would have been absurd, had it not been for the purposes of the duke, either to prevent a trial that might discredit the character of the Queen of Scots, or so to reduce the credit of the regent as to make his testimony of little account. Moray was silent with astonishment, but Lethington answered boldly and promptly: "Let the lands," he said, "of Huntingdon, Cumberland, and Northumberland, which Scotland of old possessed in England, be restored to her, and she would do homage for these lands, as she had formerly done; but as to the crown and kingdom of Scotland," he added, "it is more free than England had lately been when it paid St. Peter's penny to the pope." By this unexpected outburst of patriotism the speaker showed, that however ready to sacrifice parties, or profit by their contentions, he was not ready to sacrifice his country itself, or subject it to a foreign power. His answer was conclusive, and during the conferences there was no further mention of homage. But notwithstanding this zeal for the independence of his country, a feeling which he shared in common with every Scot, Maitland was no friend to the commission with which he was joined. His familiarity with the Marian party and his correspondence with the queen herself, were well known to the Earl of Moray, who preferred on that account to keep the restless intriguer under his own notice, instead of leaving him behind in Scotland; but Maitland soon showed that he could be dangerous as an assistant in England as well as an enemy at home. While the conference was held at York, he placed himself in communication with the Duke of Norfolk; and on discovering the treacherous designs of the latter, he was now at work to promote them. That unfortunate nobleman, although the highest and most powerful of his class in England, was ambitious of becoming higher still; and the troubles in Scotland, the flight of Mary into England, and the durance to which she was subjected by Elizabeth, had opened a tempting prospect to the most extravagant of his wishes. By deposing his own sovereign, and espousing the Queen of Scots, he would virtually become the king both of England and Scotland; and by the united influence of himself and his royal consort, the Catholic faith in Britain might be restored to its former pre-eminence. Maitland, if he did not originally suggest this ambitious union, at least laboured to give form and consistency to the plan, and while at York scarcely a night passed in which he was not closeted with the duke and his principal adherents, to whom he imparted his own purposes as well as the designs and arrangements of Moray. Frequently, also, he went out with Norfolk into the fields, under the pretext of hunting, but in reality to mature their conspiracy. The first aim of the pair was to throw such obstacles in the way of the commission that the investigation should not proceed, and the guilt of Mary be brought to light; or to raise such troubles in Scotland that Moray should be abruptly recalled. Another was, to convey intelligence to Mary in prison of these arrangements in her behalf, so that she might be prepared to second them when the season for action had arrived; and for the purpose of opening this communication with the royal captive, Maitland communicated the proceedings to John Leslie, Bishop of Ross, her confidential correspondent, who in turn imparted them to his mistress. But the bishop was so sanguine, and his plans had so often failed, that Mary had thrown aside his letters as useless, on which account they were read by several, so that their contents were not long in reaching the regent Moray. He was already aware of the intercourse of Maitland with his

enemies, but now he had learned the full amount of his treachery. Accordingly, when there was occasion to send Maitland to London as envoy of the Scottish commissioners at the court of Elizabeth, he was not sent alone; for James Macgill of Rankeillor accompanied him, ostensibly to assist him, but in reality to watch over his proceedings.

We have no further account of the doings of Lethington in connection with the transactions of the commission in England; but it may be that the surveillance now kept over him had made him more watchful and wary. On returning to Scotland with the commissioners, his wily brain appears to have been more restless than ever; and his whole prospects were staked upon the deliverance of Mary, and her restoration to the throne. On this account he laboured to second the designs of Norfolk in Scotland, until they had hopelessly collapsed, and afterwards to rally her scattered party in Scotland for united effort in her behalf. But his matchless cunning, for which he had obtained the name of the Scottish Machiavelli, was opposed by the wisdom and sagacity of the regent Moray. One of Maitland's devices was to obtain from some of the nobles of his party a band for his protection against the powerful Earl of Morton, with whom he was at variance; but the secret purpose of the application was to unite them for the restitution of Mary. He also drew over to the queen's party the brave Kirkcaldy of Grange, to whom the victory of Langside had been chiefly owing, and who was now captain of the castle of Edinburgh. The regent's endurance for one whom he had so greatly favoured and esteemed could last no longer; the difficulties of his position were complicated by the crafty Lethington, under whose exertions the queen's party was growing in strength, and who was now suspected of being the chief contriver of all the plots and conspiracies in favour of Mary both in England and Scotland. Accordingly, while holding a council at Stirling, Moray sent for Maitland, who at that time was at Perth. The arch-conspirator was dismayed by the summons, but remembering the regent's wonted clemency, he ventured upon the journey, taking with him the Earl of Athol as arbiter, should such be necessary. On arriving in Stirling, and assuming his seat at the council as a member, he was accused by Thomas Crawford, a dependant of the Earl of Lennox, of the late murder of Darnley—a convenient accusation at the time, and usually brought forward against the politic and powerful, more especially, as from the mystery of the deed, and the numbers supposed to be accessory to its commission, the charge could be more easily made than refuted. Although Maitland's dark designing character, and the whisper of general suspicion countenanced the charge, Moray did not commit him immediately to prison, but sent him to Edinburgh, and placed him in ward under Alexander Hume of North Berwick. Here, however, he did not remain long, for at night Kirkcaldy of Grange waited upon Hume with a letter forged in the regent's name, requiring him to deliver up his prisoner to Grange; and this being done without suspicion, Maitland was carried up to the castle, where he could safely defy Moray and all his accusers. He even desired that he should be subjected to a trial, and a day was fixed for the purpose; but at the appointed time he appeared with such a force of his friends and supporters, whom he had summoned for the purpose, that not only the court but the city lay at their mercy. The regent finding that preparation had been made for a battle rather than a trial, proceeded no further; and the diet being deserted, Maitland was dismissed unquestioned.

The assassination of Moray having occasioned the election of a new regent, Lethington, who was now the recognized head of the queen's party, endeavoured to delay it. His hope was, that the country being in a state of anarchy for want of a ruler, would be better suited for the success of his plots, and the restoration of Mary to the throne. During this unquiet period he was ill, or pretended to be ill, of the gout, but such numbers daily resorted to him, that his house was called the school, and he the schoolmaster. In this manner he continued to intrigue for the captive queen during the rest of the regency of Moray; and when that distinguished ruler was assassinated, the event was thought so favourable for the queen's party, that Maitland was supposed to have had a share in suggesting and promoting the deed. Of this indeed no evidence appears to have been adduced; but his crafty unscrupulous character, and the influence he was known to exercise upon every public movement, was hastily accepted as sufficient proof of his participation in that foul atrocity. Such was his influence at this time, that he called a meeting in the north which was termed the Council of Balloch: it was attended by the principal nobles who supported the Marian faction; and when the members disagreed among themselves, and were on the eve of dissolving their political partnership, he had influence to keep them together, and hold them steadfast to their principles, by promising that they should receive foreign assistance by a certain period which he specified. At that time the parliament was to meet, and his chief purpose was to prevent it from being held. To obtain this foreign countenance or aid, he wrote letters to the kings of France and Spain, the emperor and the Guises, which he forwarded to Mary for her signature and subscription. But these foreign powers had their own troubles to occupy them, and the expected aid was not sent.

The Marian faction were now so confident that they resolved to hold a convention at Edinburgh, for the purpose of deposing the regent Lennox, the successor of Moray, and taking the government of the kingdom into their own hands. To the capital accordingly they drew together, and were received into the castle, the governor of which, Kirkcaldy of Grange, had been brought wholly over by Maitland to the party of the queen. Hither also came Maitland himself, the head and soul of the party; and having landed at Leith, and being unable in consequence of the gout to travel up to the castle, he was borne to it "sting and ling"—that is, suspended or slung upon poles, in the fashion that beer-barrels were carried, Mr. Robert Maitland supporting his head. On carrying their freight to the castle each of the six received the munificent sum of three shillings Scots, which, says Bannatyne, "they received grudgingly, hoping to have gotten more for their labours." In this lowly fashion the evil genius of the castle entered within its gates as the presiding spirit of its inmates. His first proceeding on his arrival was an onslaught on the liberty of the press. The celebrated George Buchanan had written his severe satire called *The Camelion*, in which the character and deeds of the secretary were painted to the life; and fearing that it had been committed to print, Maitland sent an officer to the dwelling of the royal typographer, Robert Leckprevis, or Lapraik, to seize the obnoxious impression and its printer. But Lapraik, forewarned of the visit and its object, had previously escaped, carrying with him whatever might bring him into trouble. A more serious matter soon occupied Maitland's cares. This was the defence of the castle, by which the queen's party

were enabled to keep their hold of Edinburgh, and maintain themselves against their enemies; for open war had already broken out between both parties, and was raging with all the relentlessness of civil conflict. In this defence Kirkcaldy acquitted himself so bravely, that the stronghold bade defiance to every attack; but his character, hitherto so chivalrous and humane, underwent a sad transformation under the ascendancy of Maitland, a change of which the citizens of Edinburgh experienced the bitter fruits, in reckless cannonades, and their houses wantonly demolished. It was amidst this boom of artillery that each party held a parliament. That in the name of the young king was held at the head of the Canongate, on the outside of the city walls, and at a safe distance from the shot of the castle; while that of the friends of Mary was held in the old place, the Tolbooth of Edinburgh. Proscription was the order of the day with both, and after many on either side had been condemned as guilty of treason, both parliaments were prorogued. While they were sitting the church interposed between them in its proper character of peacemaker; and the General Assembly, which was held at Leith, appointed a commission to procure if possible a reconciliation between them. But when they entered the castle and declared their errand, Maitland, who by the silent consent of all present was the authoritative spokesman and president, answered haughtily: "We will make no offers to them who are in the Canongate; for the principals of the nobility of Scotland are here, to whom they in the Canongate are far inferior in that rank. It becometh them rather to make offers to those who are here." He then stated that should they do this, immunity for their past offences would be promised them, otherwise they must look for no offers from his party. When reminded that there was a lawful authority established in the person of the king and his regent, to whom all ought to be obedient, Maitland answered, that the establishment of the king's authority was merely meant as a temporary expedient in a moment of urgent danger, and that no one could justly be king while his mother lived. A long discussion followed, in which Maitland, who was seated before his bed in a chair, showed that neither pain nor sickness had impaired his faculties, and his reasoning in behalf of the proceedings of his party was so dexterous that his friends were at one with him, while the ministers were confounded if not convinced. He wital intermingled it with such strokes of humour as stirred them to mirth rather than resentment. It was a wonderful instance of the power of that man in swaying every mind with which he came in contact, and the Assembly's commission departed as fruitless as it came.

The hope of pacification being frustrated, the relentless civil war was continued. In the meantime John Knox, who was in the last stages of his mortal sickness, yet still continuing to preach, although in a voice so feeble that few could hear him, denounced the crimes of Kirkcaldy, Maitland, and their associates in the castle, with his wonted boldness and freedom. This was an opportunity of reprisal against his old instructor and reprovcr, as well as of setting his character to rights with his old friends the reformers, which Maitland was too politic to neglect, and accordingly he sent to the kirk-session the following letter of complaint:—

"It is come to our ears by credible report that your minister, John Knox, as well publicly in his sermons as otherwise, hath slandered me as an atheist and enemy to all religion in direct speeches: that I have plainly spoken in the castle that there is neither heaven nor hell, and that these are things

devised to make bairns afraid; with other such language tending to the like effect, unworthy to be rehearsed in the hearing of Christian ears. Which words, before God, never at any time proceeded from my mouth; nor yet any other sounding to the like purpose, nor whereof any such sentence might be gathered. For, praised be God, I have been brought up from my youth and instructed in the fear of God; and to know that he hath appointed heaven for the habitation of the elect, and hell for the everlasting dwelling-place of the reprobate. Seeing he hath thus ungently used me, and neglected his duty, vocation, the rule of Christian charity, and all good order, maliciously and untruly lying on me, I crave redress thereof at your hands; and that you will take such order therewith, that he may be compelled to nominate his authors and prove his allegation; to the end, that if it be found true, as I am well assured he shall not be able to verify it in any sort, I may worthily be reputed the man he pointeth me out to be. And if (whereof I have no doubt) the contrary fall out, you may use him accordingly: at least, that hereafter ye receive not every word proceeding from his mouth as oracles; and know that he is but a man subject to vanity, and many times doth utter his own passions and other men's inordinate affections in place of true doctrine. It is convenient that, according to the Scriptures, you believe not every spirit, but that you try the spirits whether they are of God or not."

This letter of mingled complaint and sneering the session did not present to their dying minister until two or three days afterwards; but they sent a formal answer to Maitland requiring him either properly to authorize the presenter of his mandate to conduct the trial, or appeal in his own person, and admit the session as judges in the case. Only four days after this answer had been sent, John Knox ended his earthly warfare. His last hours were occupied with melancholy forebodings of the fate which awaited those in the castle, and a desire that if possible it might yet be averted. As for that severity, he said, which he had used against Kirkcaldy of Grange, with whom he had been so familiar, it was only to bring him to acknowledge his shameful declension, that thereby he might turn him to repentance—and he desired two of the ministers then present to go and tell him that John Knox, now going to die, was the same man that he was before, when he was in full vigour; and willed him to consider the dangerous estate in which he now stood. The reformer then proceeded to answer the secretary's charge. He desired all men to consider his deeds and those of his associates, which testified their denial of a God, or of heaven or hell, where virtue should be rewarded and vice punished. It was not education that made a true Christian, nor brought a man to the true knowledge and fear of God, but the illumination of the soul by God's Spirit; for who was better brought up than Julian the Apostate, and sundry others? As to naming the reporters, which the secretary required, this he declared he would not do, although he could very well have done it. And for that part of his bill, he added, where it was said, he is "a man subject to vanity," and "all are not oracles," &c., he confessed he was but a most vile creature and wretched man; yet the words which he had spoken should be found as true as the oracles which had been uttered by any of the servants of God in times past. For he had said nothing but what was warranted by the Word, to wit, that the justice of God should never be satisfied until the blood of the shedders of innocent blood was shed again, or God moved them to unfeigned repentance—and with that he caused those who were

present to read the ninth psalm. He declared also that Lethington was the chief author of all the trouble raised both in England and Scotland. Then exhorting those present, and commending them to God, they, after prayer, departed with tears.

After this the dying reformer could not speak without great pain; and not the least intense of his sufferings was about the castle, and the coming fate of its brave but misled commander. He would yet try his last appeal to Kirkcaldy; and to David Lindsay, minister of Leith, who visited him, he said, "I have desired all this day to have had you, that I may send you yet to yon man in the castle, whom you know I have loved so dearly. Go, I pray you, and tell him that I have sent you to him yet once, to warn him; and bid him, in the name of God, leave that evil cause, and give over that castle. If not, he shall be brought down over the walls of it with shame, and hang against the sun. So God hath assured me." Lindsay, although he thought the message a hard one, delivered it faithfully, and not only Sir Robert Melvil, but Kirkcaldy himself, was moved by the prediction. Even at this moment, perhaps, it might have been available, had not the latter repaired to Maitland for counsel. We may imagine what would be the advice of the gallant captain's Mephistopheles, and how plausibly it was delivered and enforced. Kirkcaldy returned more hardened than ever, and sent a reply, ridiculing the prediction of Knox with a coarse contemptuous epithet. "Well," said the reformer when his messenger returned, "I have been earnest with my God anent the two men. For the one I am sorry that so shall befall him, yet God assures me that there is mercy for his soul. For the other, I have no warrant that ever he shall be well."

Soon after the death of the reformer affairs began to indicate that his predictions would be fulfilled. An agreement was made between the chief nobles of Mary's faction and the government, and nothing held out for the queen but the castle of Edinburgh, which was so closely invested, that its fate was but a question of days or even of hours. The regent Morton was also reinforced from England with skilful soldiers and good artillery, so that the ramparts were demolished piecemeal, and the castle would soon have been a ruin. The particulars of its surrender will be found in our notices of Kirkcaldy of Grange and the Earl of Morton, to which they properly belong. During the protracted siege, the animating spirit of the stubborn resistance was Maitland, who was now playing his last stake, and whose perseverance was so desperate when all means of resistance had failed, that the garrison at length mutinied against his obstinacy, and only reduced him to surrender by the threat of hanging him. The defenders were obliged to yield without conditions, except that their doom should be at the will of the Queen of England, and her will was, that they should be disposed of according to the pleasure of the Earl of Morton. This decided their fate, and Kirkcaldy was publicly executed, consoling himself in his last moments with the dying declaration of Knox, that whatever befel his body there was still mercy for his soul. But as for Maitland, no such consolation awaited him. Having played his last stake and lost it, his spirit was too proud to endure the ignominy of a public execution, and he died in the hands of his captors at Leith, on the 9th of July, 1573. It was generally reported that he had poisoned himself, and Sir James Melvil countenances the report by telling us that "he died after the old Roman fashion, as was said, to prevent his coming to the shambles with the rest." "He lay so long unburied," adds Calderwood, "that the ver-

min came from his corpse, creeping out under the door of the house where he was lying."

Such was the end of a statesman for whose daring no enterprise seemed too difficult, and for whose restlessness no single kingdom was a sufficient sphere. With natural talents of the highest order, and acquirements beyond those of his associates, the guidance of public events was his proper office, and accordingly, his influence as a master-spirit was felt in every great political movement of the day. But these advantages were negated by a love of change that prevented him from any consistent course of action, so that every party in the state he adopted and deserted in turn; and he changed his principles with such facility, that at length he was distrusted and despised by all parties alike, who united against him as a common enemy. It is not surprising therefore that with talents which might have founded or regenerated a kingdom, he produced nothing but confusion and disappointment, and died defeated and dishonoured. Instead of the solemn earnest spirit of the true statesman, he brought into action the stirring and exciting audacity of the gamester; and the game went against him and left him bankrupt. At the end of his career, therefore, he left nothing behind him but the lesson so often repeated and so seldom laid to heart,—that the welfare of communities, and the fate of kingdoms, are too important matters for a mere trial of ingenuity, or to be trusted to the turning of the card.

Of the indifference with which the memory of Sir William Maitland of Lethington was treated, a striking proof is to be found in the fact that no regular memoir of him, so far as we can learn, is known to exist. His name occurs, and his influence is seen, in every great event of the stirring period in which he lived; but no one has written his individual history. The only approach to his biography is to be found in Buchanan's satirical work *The Camelton*, giving a sketch of the principal events in his public life, which work is thus epitomized by the historian Calderwood:—

"In this description it is said, that at the first, when he entered in court, he addressed himself to James, after Earl of Moray, and Gilbert, then Earl of Cassilis. Through their good report and his own feigned behaviour, he was put in credit with the queen-regent. When she sent him to France, he did his own turn;—deceived the queen and the Cardinal of Lorraine. Within a short time after by moyen [influence] of such as gave him credit, he crept into credit again by another door, and under another colour. Yet, because his new fashion could have no place in respect of the old suspicion, he conveyed himself to Leith, and covered himself with the cloak of religion so long as it could serve; yet never so close but he kept a refuge to some sanctuary of the Papists if the court had changed; as to the Bishops of St. Andrews and Glasgow, and diverse others whose causes he maintained; and therefore Doctor Cranstone imparted to him largely of the spoil of St. Salvador's College, and was maintained by him. Before the queen's arrival he was contrary to the queen in all her actions, and inclined to her deprivation; after her arrival he applies himself to her and the Earl of Moray. But at length he alone was heard in secret matters and the earl was shaken off, for the earl was not well pleased with many matches attempted by the queen; as with the Prince of Spain, the emperor's brother, the Duke of Anjou. But he changed as he saw the queen change, and followed her appetite. When the queen went to the north, and Huntly should have slain the Earl of Moray by treason, he alone could fear no danger, and would

never believe that the Earl of Huntly would take such enterprises in hand; yet was he one of the readiest to gnaw the bones of the dead, to spoil the quick, and to make his profit at this market. When he went to England after this, he made both Papists and Protestants believe he laboured for them. He practised the marriage of the queen upon Henry Lord Darnley. When the Earl of Moray, for his plainness and austerity, was in a manner cast out of court, he thought to have gotten the credit of all weighty affairs. But Seigneur Davie was preferred before him. Finding himself in a worse case than he looked for, when the queen sought to make some alteration in religion, and some chief lords went out of the country, yet he held the small grip he had in court. He was an instrument to cut off Seigneur Davie. After that he fell from the king [Darnley] and nourished the dissension between him and the queen. When the Earl of Bothwell came into credit, he flattered him and consented to the murder of the king. After the death of the king the Earl of Bothwell sought his death, knowing his inconstancy and falsehood, and desirous to be rid of such a witness. Then he had no other refuge but to lurk about the Earl of Morton's wings. At the parliament held after the taking of the queen, he, with some others, partakers of the murder [of Darnley], would have had her put to death. When that purpose wrought not, he solicited some private men to hang her in her own bed with her belt, that he and his partners in the murder might be out of fear of such a witness. When this counsel was not heard, then he turned himself to flatter the queen, and sent to Lochleven the apologue of the lion delivered by the mouse out of the snare. Some say in writing, for that he perceived he could not greatly profit under the Earl of Moray's government, therefore he sought his overthrow, and her restitution. He maketh a faction among the counsellors and partakers of the king's murder, of men covetous of gear; corrupted my lord of Moray's friends and servants; travailed with Grange the captain of the castle. The regent was advertised divers times of his practices, but loath was he to mistrust any whom he had taken into friendship."

MAITLAND, WILLIAM, an antiquarian writer of some note, is generally represented as having been born at Brechin in the year 1693, though there is reason to suppose the date of his birth to have been somewhat earlier. He does not appear in his writings to have been a man of liberal education. His first employment was that of a hair merchant; in the prosecution of which business he travelled into Sweden and Denmark, to Hamburg, and other places, and appears to have realized considerable wealth. At length he settled in London, and applied himself to the study of English and Scottish antiquities. In 1733 he was elected a member of the Royal, and in 1735 a fellow of the Antiquarian Society, which latter honour he resigned in 1740, on going to reside in the country. His first publication was his *History of London*, which appeared in 1739, and was chiefly valuable for a reason little creditable to the author—namely, its being in a great measure a reduction of the ancient and scarce work of Stow. In 1740 he retired to Scotland; and in 1753 published his *History of Edinburgh*, which is by far the most useful and creditable of all his works. He was not here assisted to any considerable degree by preceding authorities; the volume is chiefly compiled from original documents, and must have been accordingly a work of very great labour. In point of composition it is very deficient. The style is mean,

and the whole tone of the work that of a plain, dull old man. It also bears in some parts the traces of credulity and narrowness of understanding on the part of the author. As a compilation of facts it is nevertheless very valuable. In 1757 Maitland published a *History of Scotland*, in two volumes folio, a work absolutely destitute of reputation. He died at Montrose, July 16, 1757, "at an advanced age," says the obituary notices, and possessed of above £10,000.

MALCOLM III., or **CANMORE**, King of Scotland. Few sovereigns in the obscure and barbarous periods of Scottish history have been more fortunate in their chances of posthumous renown than Malcolm Canmore. He has had Buchanan for his historian and Shakspeare for his eulogist. What the former learned of him from Fordun, and detailed with all the grace and majesty of the Roman language, the latter embodied in poetry, and such poetry as will endure till the end of time. Every age will feel as if Malcolm Canmore had lived but yesterday, and was worthy of every inquiry.

He was the eldest son of Duncan, who had succeeded to the throne of Scotland in consequence of the assassination of his grandfather, Malcolm II. This "gracious Duncan" of the great poet appears to have been a soft, easy king, and little fitted for the stormy people over whom he was called to rule. Still less does he appear to have been adapted to those difficult trials by which he was quickly beset, in the first instance, from the insurrection of Macdonald, one of the powerful thanes of Scotland, who called in the Islesmen to his aid; and afterwards from the invasion of the Danes, who tried the barren shores of Scotland after they had wasted to the uttermost the rich coasts of France and England. In both cases, however, he was delivered by the military prowess of his cousin Macbeth, who not only quelled the revolt of the islanders, but drove the Danes to their shipping with great slaughter. To understand aright the importance of these military services of Macbeth, we should remember that the great question at issue in Scotland now was, what race should finally predominate in the country. So large a portion of what had been England during the heptarchy had been won and incorporated into Scotland, that the Anglo-Saxon race bade fair to outnumber and surpass the Celtic; and the rebellion of Macdonald was nothing more, perhaps, than one of that long series of trials between the two peoples, in which the Celt finally succumbed. As for the Danish invasion, it might have ended either in a permanent settlement in Scotland, like that which had been effected by the Danes in Normandy, or a complete conquest, like that which they had achieved in England, while in either case Scotland would have been a sufferer.

After these dangerous conflicts had terminated, Duncan made his eldest son, Malcolm, Prince of Cumberland, by which he designated him heir to the Scottish throne. This appointment, however, was anything but pleasing to Macbeth. Here the reader will remember the predictions of the weird sisters, which form a very important fact in the strange history of the period. But Macbeth had enough to incite him in his ambitious career independently of witch or prophesies. By the Tanist law of succession, common to the Celts of Scotland as well as Ireland, Macbeth, who was the cousin-german of Duncan, should have succeeded to the government on the death of the latter, should his son be still a minor; but Duncan, by this movement in favour of young Malcolm, set aside the Tanist law, which had been

the general rule of Scotland, and precluded Macbeth from all hope of being king. To be required for his public services by exclusion from his inheritance, was too much for such an ambitious spirit; while the only chance of remedy was the possible death of Duncan before Malcolm was old enough to be his father's successor. We know how such a prospect has paved the way to a throne in every nation, whether barbarous or civilized. Duncan was assassinated. This foul deed of Macbeth, however, was not committed under trust, and in his own castle, as Shakspeare, for the purposes of poetry, has represented; but at Bothgowan (or the Smith's Dwelling), near Elgin, by an ambuscade appointed for the deed. This event is said to have occurred A.D. 1039. Macbeth immediately placed the crown upon his own head, while the two sons of Duncan fled—Malcolm, the elder, to Siward, Earl of Northumberland, his mother's brother; and Donald, the younger, to his father's kindred in the Hebrides.

The commencement of the reign of Macbeth, like that of many usurpers, was one of conciliation. He won over the powerful by donations of crown-lands, and the common people by a vigorous administration of justice, through which their safety was secured and their industry encouraged. All this was well; but either fearing the nobles, whose power he so vigorously curbed, or being naturally of a stern disposition, Macbeth began to oppress them with such severity that revolts in favour of Malcolm, whom they regarded as the true heir, ensued, which however were easily suppressed. At last, after a reign of ten years, during which he daily became more unpopular, his cruel conduct to Macduff, Thane of Fife, procured his downfall. The latter fled to Northumberland, where young Malcolm was sheltered, and besought him to march against the tyrant, whose doom he represented as certain; but Malcolm, who had been previously tried in a similar manner by the emissaries of Macbeth, and who had learned to suspect such invitations, is said by our historians to have made those objections to Macduff's appeal which Shakspeare has little more than versified in his immortal tragedy. Truth and patriotism finally prevailed over the doubts of Malcolm; and aided by an English force from Siward, the prince and thane entered Scotland, where they were joined by the vassals of Macduff and a whole army of malcontents. Even yet, however, Macbeth was not without his supporters, so that the contest was protracted for a considerable period, Macbeth retiring for that purpose into the fastnesses of the north, and especially his strong castle of Dunsinane. At length, deserted by most of his followers, he intrenched himself in a fort built in an obscure valley at Lunfannan in Aberdeenshire. Here Boece records, with his wonted gravity, all the marvels that accompanied the dying struggle of the tyrant as facts of unquestionable veracity. Leaving these, however, to historic representation, it is enough to state that Macbeth fell by the hand, it is generally supposed, of Macduff, who had personal injuries to revenge, and who, like a true Celt, was prompt enough to remember them. Instead of claiming from the grateful Malcolm what rewards he pleased in lands, titles, and pre-eminence, the Thane of Fife contented himself with stipulating that himself and his successors, the lords of Fife, should have the right of placing the Scottish kings upon the throne at their coronation; that they should lead the van of the Scottish armies when the royal banner was displayed; and that if he or any of his kindred committed "slaughter of suddeny," the deed should be remitted for a pecuniary atonement. Malcolm's next duty, immediately after his accession,

was to replace those families that had been deprived of land or office through the injustice of Macbeth. It is also added that he caused his nobles to assume surnames from the lands they possessed, and introduced new titles of honour among them, such as those of earl, baron, and knight, by which they are henceforth distinguished in the histories of Scotland.

By these changes Malcolm Canmore became king of Scotland without a rival, for although Macbeth left a stepson called Lulach (or the Fool), his opposition did not occasion much apprehension. A greater subject of anxiety was the consolidation of that strange disjointed kingdom over which he was called to rule, and here Canmore was met by difficulties such as few sovereigns have encountered. A single glance at the condition of the country will sufficiently explain the severe probation with which his great abilities were tried.

Scotland had originally consisted of the two states of Pictland and Albin, comprised within the limits of the Forth and the Clyde, while all beyond these rivers formed part of England. The troubles, however, of the latter country, at first from the wars of the heptarchy, and afterwards the Danish invasions, enabled the Scots to push the limits of their barren inheritance into the fertile districts of the south, and annex to their dominion the kingdom of Strathclyde, which comprised Clydesdale, Peeblesshire, Selkirkshire, and the upper parts of Roxburghshire. The conquest of this important territory was accomplished by Kenneth III., about one hundred years before the accession of Malcolm Canmore. In addition to this, the district of Cumbria had been ceded by Edmund I., the English king, in 946, to Malcolm I. of Scotland. Thus Malcolm Canmore succeeded to the kingdom when it was composed of the three states of Albin, Pictland, and Strathclyde. But besides these there was a fourth territory, called Lodonia or Lothian, which at one period appears to have formed part of the Anglo-Saxon kingdom of Northumbria, but had been partially conquered by the Picts in 685; and as it lay between the two countries, it had formed, from the above-mentioned period, a bone of contention between the English and the Scots until A.D. 1020, or about thirty-seven years before Malcolm Canmore's accession, when it was finally ceded by Eadulf, Earl of Northumberland, to Malcolm II., the great-grandfather of Canmore.

Thus the sovereignty of Scotland at this time, barren though it was, consisted of four separate kingdoms, all the fruits of successive conquests, and as yet not fully incorporated, or even properly united; and each was at any time ready either to resume an independent national existence of its own, or commence a war of conquest or extirpation against the others. And for such an explosion there was abundance of fierce materials in the population by which the country was occupied. For there were first the Caledonians or Picts, the earliest occupants of the land, who had successfully resisted the Roman invaders; after these were the Scots or Irish from Ulster, who had entered Scotland about the middle of the third century; and lastly, the Saxons, of different race, language, and character from the others, who, though originally conquered by the Scots and Picts, already bade fair to become the conquerors of both in turn. But besides these there was a large infusion of a Norwegian population, not only from the annexation of Strathclyde, but the invasions of the Norsemen by sea, so that many of the northern islands and a portion of the Scottish coast were peopled by the immediate descendants of these enterprising rovers. Turning to another part of the kingdom, we find a still different people, called the "wild Scots of Gal-

loway," who had emigrated from the opposite coast of Ireland, and occupied Galloway and part of Ayrshire along with the wildest of the Pictish population, among whom they had thus won a footing. Here, then, we have a strange medley of Caledonians, Cymbrians, Celts, Anglo-Saxons, and Norwegians, men of different race and language, and of rival interests, all thrust into one sterile country, to contend not merely for empty glory, but absolute subsistence. And by whom was the scanty loaf to be finally won?—but the loaf had first to be created from a flinty soil that had hitherto produced nothing but thistles; and of all these races, the Anglo-Saxon, by its skill, industry, and perseverance, showed itself the best adapted for the purpose. On the accession of Malcolm Canmore it was evidently necessary that he should identify himself with some one of these rival parties; and had he followed a short-sighted or selfish policy, he would have placed himself at the head of the Celtic interest, not only as it was still predominant, but also as he was the lineal descendant and representative of Kenneth Macalpine, the founder of the Scots-Irish dynasty. But he was the son of an Anglo-Saxon mother; he had resided in England for fifteen years; and he had been finally established in his rights chiefly by Anglo-Saxon auxiliaries, in spite of the Tanist law of succession, which had favoured the usurpation of Macbeth. Besides, his long stay in England must have convinced him of the superiority of the Anglo-Saxons in civilization, industry, and the arts of life, as well as aptitude for order and a settled government. He therefore adopted the chance of becoming a Saxon king rather than the certainty of being a Celtic chief of chieftains; and the result showed the wisdom of his choice. He was thenceforth the Alfred of his country; and the Scots under his rule became a nation and a people, instead of a heap of tribes and chieftainries.

During the first nine years of Malcolm Canmore's reign England was governed by Edward the Confessor, who was more intent on building churches than making conquests, and thus a friendly relationship was maintained between the two countries, which allowed the Scottish king to consolidate his dominions. On the death of the Confessor and accession of Harold, the latter king was soon occupied with a civil war, at the head of which was his own brother Tostig, whom he had made Earl of Northumberland. At this period, indeed, there was some danger of Malcolm being drawn into a dangerous war with England; for while there he had formed an acquaintanceship with Tostig, whom, according to an old English chronicler, he loved as a brother, so that when the Northumbrian earl fled after his first unsuccessful attempt, he betook himself for shelter to the Scottish court, and endeavoured to stir up its king to an English invasion. But Malcolm had too much good sense, or too much right feeling, to be allured by such a tempting opportunity where two brothers were at deadly variance. Disappointed in Scotland, Tostig obtained an ally in Hardrada, King of Norway, with whom he invaded England; but in the battle of Stamford Bridge their forces were completely defeated, and both king and earl were left among the slain.

Events soon followed that made the continuance of peace between the two kingdoms impossible. The veering of the same wind that had brought Hardrada from Norway wafted William the Conqueror from Normandy to England; and Harold, weakened by the victory at Stamford Bridge, fell, with all the flower of his military array, at the terrible battle of Hastings. William was now King of England, and Scotland became not only a place of refuge to Saxon

fugitives, but a mark for Norman ambition and revenge. Among those who thus fled to the Scottish court was Edgar Atheling, nearest of kin to Edward the Confessor, and chief claimant to the throne of England, with his mother Agatha, widow of Edmund Ironside, and his sisters Margaret and Christina. On reaching Dunfermline, the royal seat of the Scottish king, they found many of the English nobles, who had preceded them, while from Malcolm they experienced that full hospitality which he had himself enjoyed in England. Of the two sisters of Edgar, Margaret, who was young and beautiful, captivated the heart of her royal host, and a marriage quickly followed. Seldom has a marriage union been fraught with such advantages to a nation as that of the King of Scotland with this descendant of the noble line of Alfred, for Margaret was not only gentle, affectionate, and pious, but learned and accomplished beyond the people of her new country, and anxious to introduce among them the civilization of England. Her labours in this way form a beautiful episode in the history of the period, and have been fully detailed by her biographer Turgot, who was also her chaplain and confessor. Her first care was the improvement of her husband, whose vigorous mind she enlightened, and whose fierce spirit she soothed by the wisdom and gentleness of her counsels. The effect of this upon Malcolm was such, that though unable to read her missals and books of devotion, he was wont to kiss them in token of reverence, and he caused them to be richly bound and ornamented with gold and jewels. On arriving in Scotland, Margaret, as a Christian according to the Romish church, was grieved to find the Eastern form predominant, which she had been taught to regard as heresy, and not long after she became queen she set herself in good earnest to discountenance and refute it—for hers was not a mind to comprehend the uses of persecution in achieving the conversion of misbelievers. She invited the Culdee clergy to a debate, in which the chief subject was the proper season for the celebration of Lent—the great theological question of the day between the Eastern and Western churches; and as she was unacquainted with the language of these Culdees, Malcolm, who spoke the Celtic as well as the Saxon tongue, attended as her interpreter. This strange controversy lasted three days, and on this occasion, says Turgot, “she seemed another St. Helena, out of the Scriptures convincing the Jews.” The temporal concerns of her husband’s subjects were also taken into account, and she invited merchants from various countries, who now for the first time pursued their traffic in Scotland. Their wares chiefly consisted of ornaments and rich clothing, such as had never been seen there before; and when the people, at her persuasion, put them on, Turgot informs us they might almost be believed to have become new beings, they appeared so gay and comely. Who does not see in this the commencement of an industrial spirit—the first great step of a people from barbarism to civilization? Her influence was also shown in the royal household, the rude coarseness of which was exchanged for a numerous retinue, and orderly dignified ceremonial, so that when Malcolm appeared in public it was with a train that commanded respect. Not only his attendants, but his banquets, were distinguished by the same regal splendour, for Turgot informs us that Margaret caused him to be served at table from vessels of gold and silver plate; but suddenly checking himself, he adds, “at least they were gilt or silvered over.”

From this pleasing picture we must now turn to the stormy career of Malcolm Canmore. The arrival

of Edgar Atheling was followed by a fresh immigration of Saxons, and soon after of Normans, whom William had either disgusted by his tyranny or defrauded of their wages; while Malcolm, who needed such subjects, received them with welcome, and gave them broad lands, of which there were plenty and to spare, and from these refugees the chief nobility of Scotland were afterwards descended. The latter country became, of course, very closely connected with the struggles of the English against the Norman ascendancy, while Malcolm by his marriage was bound to support the pretensions of his brother-in-law to the crown of England. But Edgar was no match for William, and in an attempt that he made in Northumberland and Yorkshire with the aid of a Danish armament, he was so effectually defeated, that he was obliged a second time to flee to Scotland. How Malcolm, who was considered as the head of this coalition, failed to invade England when his aid was most expected, does not clearly appear, but he thereby escaped the evils of an ill-concerted and most disastrous enterprise. Two years after (in 1070) he crossed the border with an army, but found the northern counties so wasted by the previous war, that after a hasty incursion into Northumberland and Yorkshire, he was obliged to retreat. But brief as this inroad was, and unaccompanied with battle, it was not without its share of the horrors of war, for Malcolm commanded his soldiers to spare only the young men and women, who accordingly were carried into Scotland and there sold as slaves. So great was the number of these unhappy captives, that according to Simeon of Durham there was not a village and scarcely even a hovel in Scotland without them. And yet those English who escaped the visitation in many cases seem to have envied their fate, for such was the general desolation which their own Norman sovereign had inflicted, that they repaired in crowds to Scotland, and sold themselves into slavery, to avoid certain death from famine or the sword.

Had William the Conqueror not been otherwise occupied, a swift retaliation would have been certain; but from the dangerous revolts of the English, he found no leisure for the purpose till 1072, when he entered Scotland with such an army as the undisciplined forces of Malcolm were unable to meet. The whole of the Norman cavalry, in which William’s principal strength consisted, and every foot-soldier that could be spared from garrison, were mustered for the purpose, while his advance on land was supported by a fleet that sailed along the coast. He marched as far as the Tay, the Scots giving way as he approached; but in their retreat they laid waste the country in the hope of driving him back by famine. In this way Malcolm Canmore anticipated the wise plan of defence that was afterwards so successfully adopted by Bruce and Wallace. He also refused to deliver up those English and Norman nobles who had fled to him for protection. At last, William, finding “nothing of that which to him the better was”—nothing in the shape of booty or even of subsistence—was obliged to abandon his purposes of a complete conquest of Scotland, and content himself with terms of agreement. These, which were ratified between him and Malcolm at Abernethy, consisted in the latter giving hostages, and doing homage to William, as his liege lord. But for what was this homage rendered? Not for Scotland certainly, the greater part of which was still untouched, and which William would soon be obliged to leave from sheer hunger. It appears that this homage was merely for the lands of Cumberland and part of the Lothians, which Scotland had formerly held of the English crown, but which feudal acknow-

ledgment Canmore had withheld, as not judging the Norman to be the lawful King of England. Now, however, he prudently yielded it, thus recognizing William as the English sovereign *de facto* at least, if not *de jure*; and with this concession the latter seems to have been satisfied, for he returned to England without any further attempt. And this homage, as is well known, implied neither inferiority nor degradation, for even the most powerful sovereigns were wont to give such acknowledgment for the dukedoms or counties they might hold in other kingdoms. In this way the Kings of England themselves were vassals to the French crown for their possessions which they held in France. At the utmost Malcolm did nothing more than abandon the claims of Edgar Atheling, which experience must have now taught him were scarcely worth defending. Edgar indeed was of the same opinion, for soon after he abandoned all his claims to the crown of England, and was contented to become the humble pensionary of the Norman conqueror.

A peace that lasted a few years between England and Scotland ensued, during which, although little is heard of Malcolm Canmore, it is evident from the progress of improvement in his kingdom that he was by no means idle. Scotland was more and more becoming Anglo-Saxon instead of Celtic or Norse, while the plentiful immigrations that continued to flow from England filled up the half-peopled districts, enriched the barren soil with the agriculture of the south, and diffused the spirit of a higher civilization. The superiority of these exiles was quickly manifested in the fact, that they laid the foundations of those great families by whom Scotland was afterwards ruled, and by whom the wars of Scottish independence were so gallantly maintained. Malcolm, too, their wise and generous protector, was able to appreciate their worth, for he appears to have been as chivalrous as any man of the day, whether Norman or Saxon. Of this he on one occasion gave a signal proof. Having learned that one of his nobles had plotted to assassinate him, he concealed his knowledge of the design, and in the midst of a hunt led the traitor into the forest, beyond the reach of interruption. There dismounting, and drawing his sword, he warned the other that he was aware of his purpose, and invited him to settle the contest, man to man, in single combat, now that there was no one at hand to prevent or arrest him. Conquered by such unexpected magnanimity, the man fell at the feet of Malcolm and implored forgiveness, which was readily granted. This generosity was not thrown away, for the noble was converted from an enemy and traitor into a faithful and affectionate servant.

Peace continued between England and Scotland during the rest of the Conqueror's reign; but in that of William Rufus the national rancour was revived. An invasion of England was the consequence while Rufus was absent in Normandy; but the English nobility, who governed during his absence, offered such a stout resistance, that the invaders retreated. On the return of Rufus the latter endeavoured to retaliate by a counter-invasion both by land and sea; but his ships were destroyed before they arrived off the Scottish coast, and the army on reaching a river called *Scottie Uatra* (supposed to be Scotswater), found Malcolm ready for the encounter. Here a battle was prevented by the interposition of mutual friends, and the discretion of the Scottish sovereign. "King Malcolm," thus the Saxon chronicle states, "came to our king, and became his man, promising all such obedience as he formerly rendered to his father; and that he confirmed with an oath. And the king, William, promised him in land and in all things

whatever he formerly had under his father." In this way the storm was dissipated, and matters placed on their former footing; but thus they did not long continue. On returning from Scotland Rufus was struck with the admirable position of Carlisle, and its fitness to be a frontier barrier against future invasions from Scotland; upon which he took possession of the district without ceremony, drove out its feudal lord, and proceeded to lay the foundations of a strong castle, and plant an English colony in the town and neighbourhood. It was now Malcolm's turn to interpose. Independently of his kingdom being thus bridled, Carlisle and the whole of Cumberland had for a long period belonged to the elder son of the Scottish kings, and was one of the most valuable of their possessions on the English side of the Tweed. War was about to commence afresh when Malcolm was invited to Gloucester, where the English king was holding his court, that the affair might be settled by negotiation; but thither he refused to go until he had obtained hostages for his safe return—a sure proof that he was an independent King of Scotland, and not a mere vassal of the English crown. His claims were recognized, and the hostages granted; but on arriving at Gloucester he was required to acknowledge the superiority of England by submitting to the decision of its barons assembled in court. It was an arrogant and unjust demand, and as such he treated it. He declared that the Scottish kings had never been accustomed to make satisfaction to the Kings of England for injuries complained of except on the frontiers of the two kingdoms, and by the judgment of the barons of both collectively; and after this refusal he hurried home and prepared for instant war.

That war was not only brief but most disastrous to Scotland. At the head of an army composed of different races not yet accustomed to act in concert, Malcolm crossed the border and laid siege to Alnwick. While thus occupied he was unexpectedly attacked by a strong English and Norman force, Nov. 13, 1093. His troops, taken by surprise, appear to have made a very short resistance, and Malcolm himself, while attempting to rally them, was slain in the confusion of the conflict. With him also perished his eldest son Edward, who fell fighting by his side.

While an event so mournful to Scotland was occurring before the walls of Alnwick, another was about to take place within the castle of Edinburgh. There Queen Margaret, the beloved of the kingdom, lay dying. She had already received the viaticum, and was uttering her last prayer, before her eyes should be closed in death, when her son Edgar, who had escaped from the battle, entered the apartment and stood before her. She hastily asked, "How fares it with the king and my Edward?" The youth could not speak. Eagerly perusing his face with her looks, "I know all," she exclaimed, "I know all; by this holy cross, and by your filial love, I adjure you to tell me the truth." He told her that husband and son had fallen. She raised her eyes to heaven, and said, "Praise and blessing be to thee, Almighty God, that thou hast enabled me to endure such bitter anguish in the hour of my departure, thereby purifying me, as I trust, from the corruption of my sins. And thou, Lord Jesus Christ, who, through the will of the Father, hast given life to the world by thy death, O deliver me!" Instantly after she was dead. To this a touching legend has been added. After being canonized by the church her relics were to be removed from their grave to a more honourable tomb; but it was found impossible to lift the body until that of her husband had been removed also.

It is to be regretted that for the biography of such a man as Malcolm Canmore, the particulars are so few, so obscure, and in several cases so contradictory. His life, however, is chiefly to be read not in particular incidents, but in its great national results. If Bruce was the liberator and Knox the reformer of Scotland, Canmore was its founder; and should a future age expand the few pillars upon the Calton Hill into a national monument, the statues of these three illustrious men would undoubtedly occupy the foremost place in it, as the impersonations of Scottish character, and the sources of Scottish history.

MALCOLM, SIR CHARLES. The family to which this naval commander belonged was remarkable for producing not less than four brothers, who all won their way to rank and distinction by the greatness of their public services. Sir Charles was the tenth and youngest son of George Malcolm, and was born at Burnfoot, Dumfriesshire, in 1782. Being destined for the naval profession, he entered it when only nine years old, and was so fortunate in a course of active service that followed, as to have his brother Pulteney for his commander, under whom he was master's mate of the *Forx*, 32. In this ship he served in 1798, when, in company with the *Sybill*, 38, they entered the harbour of Manila under Spanish colours, made a dashing attack upon three ships of the line and three frigates, and captured seven boats with a large quantity of military stores, and took 200 prisoners. Rising still in the service, he was in course of time promoted to the command of the *Narcissus*, 32, and in 1807 was slightly wounded in an attack upon a convoy of thirty sail in the Conquest Roads. In 1809 he aided in the capture of the Saintes Island in the West Indies. In June of the same year, having been appointed to the command of the *Rhine*, 38, he was employed in active co-operation with the patriots on the north coast of Spain, a service in which several of our most distinguished naval commanders were occupied at the same period. After this he was employed in the West Indies and upon the coast of Brazil; and on the 18th of July, 1815, he landed and stormed a fort at Corigion, near Abervack. Thus briefly are we obliged to sum up a course of service that lasted several years, with little intermission. It was a period, however, of great naval events, in which the public attention was regaled with such a succession of splendid victories by sea, that it had little attention for the exploits of single ships or the details of privateering. Still, an idea of the active and important nature of Captain Malcolm's services may be gained from the fact, that while in command of the *Narcissus* and the *Rhine*, he not only captured great numbers of merchantmen, but took more than twenty privateers, carrying 168 guns and 1059 men.

On the return of peace Malcolm's services were not to be dispensed with; and in 1822 he was appointed to the command of the *William and Mary*, royal yacht, lying at Dublin in attendance upon the Marquis of Wellesley, lord-lieutenant; and in the following year he had the honour to receive knighthood from the vice-regal hand. In 1826 he was appointed to the command of the *Royal Charlotte* yacht, also commissioned on the same service. But these, though sufficiently honourable employments, and indicative of a due sense of his past services, were of too quiescent a character for an active spirit still in the prime of life; and in 1827 his best aspirations were gratified by his being appointed superintendent of the Bombay Marine. To this service he diligently devoted himself for ten years, and so highly

improved it, that from an imperfect sea establishment, it grew into a regular Indian navy, adequate to the extensive wants and protection of our Eastern empire. Sir Charles was also the promoter of many important surveys within the extensive sphere of his command, and took an influential part in the establishment of steam-navigation in the Red Sea. Well-merited promotion continued to follow these exertions, for he was raised to the rank of rear-admiral in 1837, and to that of vice-admiral in 1847.

In turning to his personal history it is only necessary to add, that in 1808 Sir Charles married his cousin Magdalene, daughter of Charles Pasley, Esq., by whom he had one daughter; and on becoming a widower he married in 1829 Elmira Riddell, youngest daughter of Major-general Shaw, by whom he had three sons. In his character he fully abounded in that seaman-like courage, frankness, and courtesy, which Napoleon so much admired in his brother Sir Pulteney Malcolm. The death of Sir Charles occurred at Brighton, on the 14th June, 1851, at the age of sixty-nine.

MALCOLM, SIR JOHN, a distinguished soldier and diplomatist, was born on the farm of Burnfoot, near Langholm, on the 2d of May, 1769. This farm was granted to the paternal grandfather of Sir John, at a low rent, by the Earl of Dalkeith in 1707; it subsequently became the residence of George Malcolm, the father of Sir John, who married Miss Pasley, daughter of James Pasley, Esq. of Craig and Burn, by whom he had seventeen children, fifteen surviving to maturity. Of these children, four attained to a high station and title; namely, Sir Pulteney, vice-admiral, R.N.; Sir James, lieutenant-colonel of marines; Sir Charles, the subject of the preceding memoir; and Sir John, who now demands our notice. The farm is still in possession of the family.

Sir John Malcolm entered active life in 1782 as a cadet in the service of the East India Company; and a part of his success is to be ascribed to the zeal with which he applied himself at first to study the manners and languages of the East. Having distinguished himself at the siege of Seringapatam in 1792, he was appointed by Lord Cornwallis to the situation of Persian interpreter to an English force serving with a native prince. In 1795, on his return from a short visit to his native country on account of his health, he performed some useful services in General Clarke's expedition at the Cape of Good Hope, for which he received the thanks of the Madras government, and was appointed secretary to the commander-in-chief. In 1797 he was made captain; and from that time to 1799 he was engaged in a variety of important services, terminating in the fall of Seringapatam, where he highly distinguished himself. He was then appointed joint-secretary with Captain (afterwards Sir Thomas) Munro to the commissioners for settling the new government of Mysore. In the same year he was selected by Lord Wellesley to proceed on a diplomatic mission to Persia, where he concluded two treaties of great importance, one political and the other commercial; returning to Bombay in May, 1801. His services were acknowledged by his being appointed private secretary to the governor-general. In January, 1802, he was raised to the rank of major; and on the occasion of the Persian ambassador being accidentally shot at Bombay, he was again intrusted with a mission to that empire, in order to make the requisite arrangements for the renewal of the embassy, which he accomplished in a manner that afforded the highest satisfaction to the Company. In January, 1803, he was nominated to the presidency of Mysore, and to act without special instructions; and in De-

ember, 1804, he was promoted to the rank of lieutenant-colonel. In June the following year he was appointed chief agent of the governor-general, and he continued to serve in that capacity until March, 1806, having successfully concluded several very important treaties during that interval.

Upon the arrival in India, in April, 1808, of the new governor-general, Lord Minto, Colonel Malcolm was sent by his lordship to the court of Persia on a very important mission—that of endeavouring to counteract the designs of Bonaparte, then in the zenith of his power, who threatened an invasion of India by way of Persia, supported by the Persian and Turkish governments. In this difficult embassy Colonel Malcolm did not wholly succeed. He returned to Calcutta in the following August, and soon afterwards proceeded to his residence at Mysore, after having, to use the words of Lord Minto, “laid the government under additional obligations to his zeal and ability.” Early in the year 1810 he was again selected to proceed in a diplomatic capacity to the court of Persia, whence he returned upon the appointment of Sir Gore Ouseley as ambassador. So favourable was the impression which he made on this occasion on the Persian sovereign, that he was presented by him with a valuable sword and star, and, at the same time, made a khan and sepahdar of the empire; to that impression, indeed, may be ascribed much of the good understanding, both in a political and commercial point of view, which afterwards subsisted between this country and Persia. During this embassy, while at Bagdad, Colonel Malcolm transmitted to the government of Bengal his final report of the affairs of Persia—a document so highly appreciated, that the government acknowledged its receipt to the secret committee in terms of unqualified praise.

In 1812 Colonel Malcolm again visited his native shores. He was received by the court of directors of the East India Company with the deepest regard and acknowledgment of his merits; and shortly afterwards he received the honour of knighthood. He returned to India in 1816, and soon became engaged in extensive political and military duties; he was attached, as political agent of the governor-general, to the force under Lieutenant-general Sir T. Hislop, and appointed to command the third division of the army, with which, after taking Talym by surprise, he acted a prominent part in the celebrated battle of Mehidpoor, when the army under Mulhar Rao Holkar was completely beaten and put to the rout. His skill and valour on this occasion were the theme of general admiration. A vote of thanks was awarded him, on the proposal of Mr. Canning, by the House of Commons; and the prince-regent expressed his regret that the circumstance of his not having attained the rank of major-general prevented his creating him a knight grand cross. The intention of his royal highness to do so was nevertheless recorded, and in 1821 he accordingly received the highest honour which a soldier can receive from his sovereign. After the termination of the war with the Mahrattas and Pindarees, to which Colonel Malcolm's services had eminently contributed, he was employed by Lord Hastings in visiting and settling the distracted territories of Mulhar Rao, which, and other services, he accomplished in a most satisfactory manner, gaining to British India a large accession of territory and treasure.

At the end of the year 1821 he resolved to return once more to England; on which occasion the general orders contained the following paragraph:—“Although his excellency the governor-general in council refrains from the specific mention of the

many recorded services which have placed Sir John Malcolm in the first rank of those officers of the Honourable Company's service who have essentially contributed to the renown of the British arms and counsels in India, his lordship cannot omit this opportunity of declaring his unqualified approbation of the manner in which Sir John Malcolm has discharged the arduous and important functions of his high political and military station in Malwah. By a happy combination of qualities which could not fail to earn the esteem and confidence both of his own countrymen and of the native inhabitants of all classes, by the unremitting personal exertion and devotion of his time and leisure to the maintenance of the interests confided to his charge, and by an enviable talent for inspiring all who acted under his orders with his own energy and zeal, Sir John Malcolm has been enabled, in the successful performance of the duty assigned to him in the Malwah, to surmount difficulties of no ordinary stamp, and to lay the foundations of repose and prosperity in that extensive province, but recently reclaimed from a state of savage anarchy, and a prey to every species of rapine and devastation. The governor-general in council feels assured that the important services thus rendered to his country by Sir John Malcolm, at the close of an active and distinguished career, will be not less gratefully acknowledged by the authorities at home, than they are cordially applauded by those under whose immediate orders they have been performed.”

Sir John returned to England in April, 1822, with the rank of major-general, and soon after he was presented by those who had acted under him in the war of 1818 and 1819 with a superb vase of the value of £1500. During this visit to England Sir John received a proud testimony of the favour of the East India Company, and acknowledgment of the utility of his public career, in a grant passed unanimously by a general court of proprietors, of £1000 per annum, in consideration of his distinguished merits and services.

Sir John had quitted India with the determination to spend the evening of his life in his native country; but the solicitations of the court of directors, and of his majesty's ministers for the affairs of India, induced him again to embark for the East, where experience had so fully qualified him to act with advantage. In July, 1827, he was appointed to the high and responsible situation of governor of Bombay, which post he continued to fill until 1831, when he finally returned to England, having effected, during the few years of his governorship, incalculable benefits both for this country, our Indian territories, and every class of the inhabitants there. Upon his leaving Bombay the different bodies of the people seemed to vie with each other in giving proofs of the esteem and high consideration in which he was held. The principal European gentlemen of Bombay requested Sir John to sit for his statue, afterwards executed by Chantrey and erected in Bombay; the members of the Asiatic Society requested a bust of him, to be placed in their library; the native gentlemen of Bombay solicited his portrait, to be placed in their public room; the East India Amelioration Society voted him a service of plate; the natives both of the presidency and the provinces addressed him as their friend and benefactor; and the United Society of Missionaries, including English, Scottish, and Americans, acknowledged with gratitude the aids they had received from him in the prosecution of their pious labours, and their deep sense of his successful endeavours to promote the interests of truth and humanity, with the welfare and prosperity of his

country and his countrymen. These were apt and gratifying incidents in the closing scene of his long and arduous services in our Indian empire. But whether at home or abroad, all parties who knew anything of his career concurred in awarding him the highest praises, both as a civil, military, and political character; and the brief encomium of Mr. Canning in parliament, that he was "a gallant officer, whose name would be remembered in India as long as the British flag is hoisted in that country," is only in accordance with the universal opinion of his merits.

Shortly after Sir John's arrival in England in 1831, he was returned to parliament for the burgh of Launceston, and took an active part in the proceedings upon several important questions, particularly the Scottish reform bill, which he warmly opposed. He frequently addressed the house at length; and his speeches were characterized by an intimate knowledge of the history and constitution of his country, by a happy arrangement, and much elegance of expression. Upon the dissolution of parliament in 1832, Sir John became a candidate for the Dumfries district of burghs; but being too late in entering the field, and finding that a majority of the electors had promised their votes, he did not persevere. He was then solicited to become a candidate for the city of Carlisle, and complied; but having been too late in coming forward, and being personally unknown in the place, the result of the first day's poll decided the election against him. Sir John then retired to his seat near Windsor, and employed himself in writing a work upon the government of India, with the view of elucidating the difficult questions relating to the renewal of the East India Company's charter. One of his last public acts was an able speech in the general court of proprietors of East India stock, and the introduction of certain resolutions relative to the proposals of government respecting the charter— which resolutions were, after several adjourned discussions, adopted by a large majority. His last public address was at a meeting in the Thatched House Tavern, for the purpose of forming a subscription to buy up the mansion of Sir Walter Scott for his family; and on that occasion his concluding sentiment was, "that when he was gone, his son might be proud to say that his father had been among the contributors to that shrine of genius." On the day following he was struck with paralysis, the disorder which had just carried off the illustrious person on whose account this address had been made. His death took place in Prince's Street, Hanover Square, London, on the 31st of May, 1833.

As an author, the name of Sir John Malcolm will occupy no mean place in the annals of British literature. His principal works are—"A Sketch of the Sikhs, a Singular Nation in the Province of the Punjab, in India;" "The History of Persia, from the Earliest Period to the Present Time;" *Sketches of Persia*; *A Memoir of Central India*; and his treatise on the *Administration of British India*, which was published only a few weeks before his death. Sir John had also been engaged for some time before his death in writing a life of Lord Clive, which afterwards appeared.

Sir John married, on the 4th of June, 1807, Charlotte Campbell, daughter of Sir Alexander Campbell, baronet, who was commander-in-chief at Madras, by whom he left five children, viz.: Margaret, married to her cousin Sir Alexander Campbell; George Alexander, a captain in the guards; Charlotte Olympia; Anne Amelia; and Catharine Wellesley.

Upon the public character of Sir John Malcolm

it would be superfluous to pass any lengthened eulogium in this place, since that character is so forcibly and faithfully sketched in the facts we have just recorded. Let it suffice to say, that he was a true patriot; that the chief end and aim of his public life was to advance the prosperity of his country—to promote the condition of every class of his fellow-creatures. Such is the conclusion which the records of his life enable us to draw; and his private character was in perfect keeping with it: he was warmly attached to his kindred and connections; as a friend, he was constant and devoted; and all his social qualities might be said to "lean to virtue's side." Last, though not least of all, he was a sincere and devout Christian; and in every part of the world where it was his fortune to be placed, and under whatever circumstances, he never shrunk from any opportunity of evincing his deep regard for the religion of his country.

MALCOLM, SIR PULTENEY, Admiral of the Blue, G.C.B. and G.C.M.G. This gallant admiral was one of that brotherhood of the Malcolms, whose talents raised them to such high distinction. He was born on the 20th of February, 1768, at Douglan, near Langholm, Dumfriesshire, and was the third son of the family. Having chosen the naval profession as his path to fame and fortune, he embarked as midshipman on the 20th of October, 1778, on board the *Sybilie* frigate, commanded by Captain Pasley, afterwards Admiral Sir James Pasley, Bart., his mother's brother. Thus launched at the early age of ten, young Pulteney's first trial of his profession was a voyage to the Cape of Good Hope; and at his return he was transferred to the *Jupiter* of 50 guns. His first promotion, after nearly five years' service, was to the rank of lieutenant in 1783. After having served successively in several ships, and upon various stations, he was employed as first lieutenant of the *Penelope* of 32 guns at Jamaica; and as the war kindled by the French revolution had commenced, it was not long until he was called into active employment. Among his services was the capture of the French frigate the *Inconstante*, and a corvette, in which he assisted as first lieutenant, and afterwards carried the prizes to Port-Royal. He also saw hot service as commander of the *Penelope's* boats, in cutting out vessels from the ports of St. Domingo; and was so successful that he was promoted to the rank of commander in 1794, in which capacity he had the charge of the seamen and marines who were landed at the mole of Cape Nicola, to garrison that place, which had been surrendered to the British by their allies the French royalists. After his return from that station to England, Lieutenant Pulteney Malcolm was advanced to the rank of post-captain in October, 1794, and in the following month was appointed to the command of the *Fox* frigate. In the early part of the next year he conveyed a fleet of merchantmen to Quebec, and afterwards another to the East Indies; and upon that station he captured *La Modeste*, a French frigate of 20 guns. In 1797 he was employed in the China seas, under the command of Captain Edward Cooke of the *Sybilie*; and during the same year he had for his passenger homeward Colonel Wellesley, the future hero of Waterloo, who was then returning from India. Neither storm nor enemy occurred by the way to put the *Quid times? Casarem vehis* to the test.

In this manner Captain Malcolm was making way by useful services, in which his courage and professional skill were fully attested, and the singular fortune that seemed to have rested upon his family

insured his well-merited advancement. In 1798 he was appointed to the command of the *Suffolk*, a third-rate of 74 guns, bearing the flag of Admiral Rainier, commander-in-chief in the Indian seas, and was afterwards transferred to the *Victorious*, in consequence of the flag being removed to the latter ship. On this station Captain Malcolm served till the end of the war; and on his passage homeward in 1803 he encountered one of those casualties to which his profession must be always subject. In the Bay of Biscay the *Victorious* encountered such a violent gale that it was kept with the utmost difficulty from foundering; all that could be done was to make for the Tagus, where the ship was run on shore and broken up, while her commander and crew returned in two vessels that were hired at Lisbon for the purpose. After this disaster Captain Malcolm had the command of several ships successively in the Mediterranean, until in 1805 he was appointed to the *Donegal*, a third-rate, where he continued for six years. His ship formed part of the fleet under Nelson, employed in the pursuit of the combined French and Spanish squadron to the West Indies; and at its termination he was sent to reinforce the ships under Collingwood off Cadiz. As the *Donegal* had been long at sea, it was necessary to refit her; and for this purpose she was carried to Gibraltar, where she lay at anchor in the mole almost wholly dismantled. This was on the 17th of October, only four days before the victory of Trafalgar. While thus reduced to inactivity, tidings reached Captain Malcolm, on the 20th, that the combined fleet were in the act of leaving Cadiz, and knowing that when Nelson was afloat and on the watch a fight would follow, he strained every nerve to get the *Donegal* ready for action. He was so successful that before night his ship was out at sea; and on the 23d he joined Collingwood in time to capture the *El Rayo*, a large Spanish three-decker, which had issued with Gravina's division from the port in which they had taken shelter, to attempt the recovery of the disabled prizes. Malcolm continued on this station till near the end of 1805, under the command of Admiral Sir John Duckworth, whom he accompanied in pursuit of a French squadron that had left port for the West Indies. In the naval engagement that ensued off St. Domingo on the 6th of February 1806, the *Donegal* took an ample share, and at the close was intrusted with the charge of the prizes, which were safely conveyed to Port Royal, Jamaica, and afterwards to England. On returning home Captain Malcolm for his gallant conduct in the action received, with his brother commanders, the thanks of both Houses of Parliament, and was honoured with a gold medal; he was also presented with a silver vase of £100 value by the committee of the Patriotic Fund.

It often happens that services of the highest importance, even in warfare itself, are neither conducted with the roar of cannons, nor signalized with the fanfare of trumpets; and yet their right performance demands not only the highest amount of skill, but also of devoted patriotism. Such was the next duty in which Captain Malcolm was employed in the summer of 1808; it was to escort the army of Sir Arthur Wellesley from Cork to Portugal, and superintend its debarkation. And how strangely the veriest nautical flaw upon this momentous occasion might have altered the whole course of European history! With Cæsar and his fortunes once more committed to his care, Captain Malcolm conveyed the officers to their destination in Mondego Bay, and superintended the landing of the troops, which was accompanied with the utmost precision

and success, notwithstanding the obstacles of a heavy surf. This critical task being happily accomplished, he returned to England, where an affair of some importance to himself was his next transaction. This was his marriage to Clementina, eldest daughter of the Hon. William Fullerton Elphinstone, and niece of Admiral Lord Keith, which occurred on the 18th of January, 1809. Brief, however, was his enjoyment of a new and happy home on shore; for in little more than two months after we find him afloat, and employed under Lord Gambier in the successful attack upon the French ships in Aix Roads. After this event he was invested with the command of a squadron sent out on a cruise; and subsequently to superintend the blockade of Cherbourg, where he captured a number of privateers and shut up others within the shelter of their land-batteries. Little afterwards occurred till 1812, when he was appointed captain of the Channel fleet; and in the year following raised to the rank of rear-admiral. In this capacity he was employed to convey a body of troops under General Ross to North America, and afterwards to assist Sir Alexander Cochrane in the conveyance and subsequent return of our forces employed against Washington and New Orleans. As great deeds and important services had accumulated to an immense amount during this stirring period, it was found necessary, at the commencement of 1815, to extend the order of the Bath into three classes; and on this occasion Admiral Malcolm was not forgot. He was created a knight-commander; and it was an unwonted spectacle to see three brothers, all distinguished in their several departments, invested with this honour at one and the same period.

On the return of peace by the deposition of Napoleon, Sir Pulteney Malcolm's naval career seemed to have been terminated. But the escape of Bonaparte from Elba compelled the weather-beaten admiral to weigh anchor once more; and he was appointed on this occasion to co-operate with the Duke of Wellington and the allied armies in their last great campaign. At its close, which consigned Napoleon to perpetual exile, Sir Pulteney was appointed commander-in-chief of the St. Helena station—a ticklish office, which brought him into frequent and friendly intercourse with the man whose movements he was obliged to watch, and whose chances of escape it was his duty to frustrate. In this trying situation, however, he conducted himself with such firmness and gentleness combined, and so greatly to the satisfaction of the fallen hero, that the latter, while he discharged the whole brunt of his indignation upon the unlucky head of Sir Hudson Lowe, had an entirely different feeling for the admiral. "Ah! there is a man," he exclaimed, "with a countenance really pleasing: open, frank, and sincere. There is the face of an Englishman—his countenance bespeaks his heart; and I am sure he is a good man. I never yet beheld a man of whom I so immediately formed a good opinion as of that fine soldier-like old man. He carries his head erect, and speaks out openly and boldly what he thinks, without being afraid to look you in the face at the time. His physiognomy would make every person desirous of a further acquaintance, and render the most suspicious confident in him." Such was the striking portrait of Sir Pulteney drawn by the hand of a master—one who was the greatest of painters through the medium of language, as well as the first of epic poets by deed and action. On one occasion, when the impatient spirit of the exile burst forth, he exclaimed to the admiral, "Does your government mean to detain me upon this rock until my death's-day?" "Such, I apprehend, is their purpose," replied Sir Pulteney, calmly. "Then the

term of my life will soon arrive," cried the indignant ex-sovereign. "I hope not, sir," was the admiral's answer; "I hope you will survive to record your great actions, which are so numerous, and the task will insure you a term of long life." Napoleon bowed at this gratifying and well-merited compliment, and quickly resumed his good humour. Sir Pulteney continued in the command of the St. Helena station from the spring of 1816 till near the close of the following year; and when he left it he was on the best terms with Napoleon, who frequently afterwards used to speak of the pleasure he had enjoyed in his society.

As there was no further naval service for Sir Pulteney Malcolm, his rank in the navy continued to rise according to the established routine. He was advanced, therefore, to the rank of vice-admiral in 1821, and of full admiral in 1837. During this interval he was also invested with the grand cross of the Bath in 1833. Thus honoured in his public and beloved in private life, Sir Pulteney Malcolm died at East Lodge, Enfield, on the 20th of July, 1838, in the eighty-first year of his age. A public monument has since been erected to his memory.

MALLET, DAVID, a poet and miscellaneous writer, is said to have been a descendant of the clan Macgregor, so well known for its crimes and persecution. When that unhappy race were proscribed by a solemn act of state, an ancestor of the poet escaped to the Lowlands and assumed the fictitious name of Malloch. James Malloch, the father of the poet, kept a small public-house at Crieff, on the borders of the Highlands, where it is supposed that David was born about the year 1700. Of his career from youth to manhood nothing certain is known, nor whence he first derived his education, as in after-life, either through pride or prejudice, he studiously endeavoured to conceal his true name and origin.

Having studied for a time under Mr. Ker, a professor in Aberdeen, he, it appears, removed to Edinburgh, where he was in 1720 employed in the station of tutor to the children of a Mr. Home; he at the same time attended the university of that city. He had while at Aberdeen early exercised himself in poetical composition; and a pastoral and some other small pieces which he wrote about this period attracted the notice of many of the Scottish literati, by whom he was kindly sought after. Finding his situation in Mr. Home's family by no means agreeable, being treated, it is said, with great illiberality, he anxiously sought to change it, and was so fortunate as to be recommended by the professors of the college to the Duke of Montrose, who wanted a fit person to be tutor to his two sons, who were then going to Winchester. It is obvious that he must have conducted himself while at college with uncommon zeal and propriety, as nothing but superior ability could have procured for a youth so humbly connected so marked a preference over the rest of his fellow-students. He was most kindly received in his grace's family; and on coming to London in the winter, attended his noble pupils to most places of public amusement, and still further improved himself in polite literature and a knowledge of the world.

Malloch accompanied his noble pupils to the Continent, and made what is usually called the grand tour. On their return to London he still continued to reside with that illustrious family, where, from his advantageous station, he got by degrees introduced to the most polished circle of society. In 1723, in a periodical work of Aaron Hill's, called the *Plain Dealer*, No. 36, Malloch's pleasing ballad of "William and Margaret" first appeared. The beauty of

the production was so highly praised, that it inspired him with courage to apply himself closely to his poetical studies, which he had for some time neglected. "Of this poem," says Dr. Johnson, "he has been envied the reputation; and plagiarism has been boldly charged, but never proved,"—though "in its original state it was very different from what it is in the latter edition of his works." It is, however, evident that the idea of the ballad was taken from two much older ones, namely, *William's Ghost* and *Fair Margaret*. From these he borrowed largely both in sentiment and expression. Still, notwithstanding all traces of imitation, as a modern biographer truly observes, "there is enough of Mallet's own in the ballad of 'William and Margaret,' to justify all the poetical reputation which it procured for its author." The fame so justly acquired by his illustrious countryman Thomson, whose friendship he had the honour to enjoy, stimulated him to imitate his style; and in 1728 he produced a poem under the title of the *Excursion*. It is a collection of poetical landscapes sketched with some skill and elegance in imitation of the *Seasons*, but much inferior in strength and sublimity. About this time he adopted the foolish conceit of changing his name from *Malloch* to Mallet, to conceal from common observation his country and origin; having, as Dr. Johnson satirically remarks, "by degrees cleared his tongue from his native pronunciation, so as to be no longer distinguished as a Scot, he seemed inclined to disencumber himself from all adherences of his original, and took upon him to change his name from Scotch *Malloch* to English *Mallet*, without any imaginable reason of preference which the eye or ear can discover."

Mallet next produced a tragedy called *Eurydice*, which he had planned some years before: it was first brought on the stage in 1737, and met with no very flattering reception. Garrick, several years afterwards, when Mallet enjoyed both fame and fortune, again introduced *Eurydice* to the public; but not even the talents of that unrivalled actor, assisted by the celebrated Mrs. Cibber, could make it be tolerated for any length of time. Though so ably supported in the principal parts, so gross was the egotism of Mallet, that, as Davies tells us, he sat all the time in the orchestra, and bestowed his execrations plentifully on the players, to whom he entirely attributed the bad success of the piece.

Mallet now left the family of the Duke of Montrose, and went to reside with a Mr. Knight at Gosfield, probably as a teacher; but still he had made an impression, and enjoyed the esteem of the first literary characters of the day. There is a remarkable letter extant from Pope to Mr. Knight, in which he speaks of Mallet in the following affectionate terms:—"To prove to you how little essential to friendship I hold letter-writing—I have not yet written to Mr. Mallet, whom I love and esteem greatly; nay, whom I know to have as tender a heart, and that feels a remembrance as long as any man." With what heartless ingratitude Mallet returned this noble expression of confident esteem, will be seen afterwards. Proud in the first instance of being honoured by the particular regard of so eminent a poet, he servilely employed his pen by attacking Bentley, to please Pope, whose ridicule of critics and commentators he echoed in a poem, published in 1733, entitled *Verbal Criticism*. It is stuffed, as Bentley observes, "with illiberal cant about pedantry and collections of manuscripts. Real scholars will always speak with due regard of such names as the Scaligers, Salmasesius, Heinsiuses, Burmans, Gronoviuses, Reiskiuses, Marklands, Ges-

ners, and Heynes." Dr. Johnson considered the versification above mediocrity, which is all that can be said in its praise. About this time Frederick, Prince of Wales, being at variance with his father, kept what was considered an opposition court, where he affected the patronage of men of letters, with the hope of adding to his popularity. Mallet, through the recommendation of his friends, had the good fortune to be appointed under-secretary to his royal highness, with a salary of £200 a year. "He attended the Prince of Orange to Oxford in 1734, and presented to him a copy of verses written in the name of the university; on which occasion he was admitted to the degree of M.A. Had then the Oxford muses lost their voice? or did he assume a fictitious character for the purpose of spontaneous adulation? The circumstance is certainly extraordinary." In 1739 he published his tragedy of *Mustapha*: it was brought on the stage under the patronage of the Prince of Wales, to whom it was dedicated. The first representation of the piece is said to have been honoured with the presence of all the leading members of the opposition. The characters of Solymán the Magnificent and Rustan his vizier were generally supposed to glance at the king and Sir Robert Walpole; notwithstanding which it was licensed by the lord-chamberlain, and performed with much applause to crowded houses. But in proportion as the public mind was diverted by the appearance of another set of political actors than those to whom the play was said to refer, it lost its only attraction, and sunk with his *Eurydice* into oblivion, whence neither is likely to be ever called forth. In the following year Mallet wrote, in conjunction with Thomson, by command of the prince, the masque of *Alfred*, in honour of the birth-day of his eldest daughter the Princess Augusta. It was first acted in the gardens of Clifden by a set of performers brought from London for the express purpose; and after Thomson's death Mallet revised it for Drury Lane theatre, where it had, with the aid of music and splendid scenery, a run for a short time.

The same year he published his principal prose work, the *Life of Lord Bacon*, prefixed to a new edition of the works of that illustrious person. In point of style it may be considered as an elegant and judicious piece of biography, but nothing more. To develop the vast treasures stored in the mighty intellect of Bacon was a task to which the best intellects of that and a succeeding age would have failed to do justice. Of Mallet's performance Dr. Johnson merely says that "it is known as appended to Bacon's volumes, but is no longer mentioned."

In 1742 Mallet made a considerable addition to his fortune by marriage. He had already buried one wife, by whom he had several children; but of her there is little or no account. His second choice was Miss Lucy Estob, the daughter of the Earl of Carlisle's steward, with whom he received a portion of £10,000. From his various sources of income Mallet may be considered as one of the most fortunate worshippers of the Muses in his day, and hence, becoming either indifferent or lazy, he allowed seven years to pass over without favouring the public with anything from his pen. When at length his *Hermiit*, or *Amyntor and Theodora*, appeared, critics were much divided in their opinions of its merits. Dr. Warton, in his *Essay on the Life and Writings of Pope*, says it "exhibits a nauseous affectation, expressing everything pompously and poetically;" while Dr. Johnson praises it for "copiousness and elegance of language, vigour of sentiment, and imagery well adapted to take possession of the fancy." Up to this period the character of Mallet stood deservedly

high with the public as an author, but we now come to a part of his history when he drew down upon his head the severe but just censure of all honourable men.

Pope, who honoured Mallet with his friendship at a time when a favourable word from the bard of Twickenham was sufficient to advance the interests of any genius, however depressed by obscurity, had now introduced Mallet to Lord Bolingbroke, at the time when the *Patriot King* was first written by his lordship. Only seven copies were printed and given to some particular friends of the author, including Pope, with a positive injunction against publication, Bolingbroke assigning as a reason that the work was not finished in a style sufficiently to his satisfaction before he would consent to let it go forth to the world. Pope obliged his friend Mr. Ralph Allen of Prior Park, near Bath, with the loan of his copy, stating to him at the same time the injunction of Lord Bolingbroke; but that gentleman was so delighted with the work, that he pressed Pope to allow him to print a limited impression at his own cost, promising at the same time to observe the strictest caution, and not to permit a single copy to get into the hands of any individual until the consent of the author could be obtained. Under this condition Pope consented, and an edition was printed, packed up, and deposited in a wareroom, of which Pope received the key. There it remained until, by the untimely death of Pope, the transaction came to the knowledge of Lord Bolingbroke, who felt or affected to feel the highest indignation at what he called Pope's breach of faith. Mallet, it was generally believed at the time, was the person who informed his lordship of the transaction, but it has never been sufficiently proved that he was the unworthy author. Mr. George Rose, to whom all the particulars of the story were related by the Earl of Marchmont, the intimate friend of Bolingbroke, gives us an account of the discovery which clears Mallet of all blame. "On the circumstance," he says, "being made known to Lord Bolingbroke, who was then a guest in his own house at Battersea with Lord Marchmont, to whom he had lent it for two or three years, his lordship was in great indignation; to appease which Lord Marchmont sent Mr. Grevinkop to bring out the whole edition, of which a bonfire was instantly made on the terrace at Battersea." This, however, did not by any means appease his lordship's angry feelings. He determined on revising and publishing the work himself, and employed Mallet to write a preface, in which the part that Pope had acted was to be set forth to the world in the blackest and falsest colours possible. To the lasting disgrace of his character he was found ready to stoop to so vile and dishonourable a task. It would be vain to seek for any palliation of such egregious turpitude. He was rich, and placed beyond the craving temptation of lending himself to any one, however high in rank or interest, to defile his pen by so unworthy a task. But no compunctions visiting of honour ever once stayed his hand, or prevented him from heaping the most malignant abuse upon his departed friend, for an affair in which, it is evident, there was nothing dishonourable intended, either on the part of Pope or Allen. Every fact that could tend to exonerate Mr. Pope, particularly the share his friend had in the business, and the careful suppression of the copies until Bolingbroke's permission for their publication could be procured, is studiously concealed. "How far Mallet was acquainted with all these circumstances we cannot pretend to affirm." Nor need any one care about the proportions in which they divide the infamy between them.

The unmitigated resentment of Lord Bolingbroke for the evidently unintentional error of a friend whom he almost worshipped while living, is endeavoured to be accounted for by the preference Pope gave to Warburton, whom Bolingbroke could never endure. Be that as it may; if true, it only proves the meanness of his lordship's character, and how much mistaken Pope was in the man whose name he embalmed within his deathless page as a pattern for the most exalted and disinterested friendship. But though such may have been his lordship's feelings, pride must have made him conceal the true cause from Mallet, who had nothing but the sordid temptation of a ready hireling to incite him to the odious task. He was rewarded for this service at the death of Lord Bolingbroke by the bequest of his lordship's works, with the care and profit of those already published, as well as all his manuscripts.

Mallet, who cared as little for the fame or character of his noble benefactor as he did for the illustrious friend he was hired to traduce, with the true spirit of avarice, raked up every scrap of Bolingbroke's writings for publication, without in the least discriminating what ought to be suppressed, though many of the papers contained the most offensive doctrines, subversive of sound morals and revealed religion; the consequence was, that his hopes of gain were very properly frustrated by a presentment which arose from a decision of the grand jury of Westminster, stopping the obnoxious works. This must have sorely affected him; for before the publication of the five vols. 4to, in 1754, he was offered by one Millar, a bookseller, £3000 for his copyright, which he refused. After all, the sale was so extremely slow that it took upwards of twenty years to dispose of the first edition, though assisted by the notoriety of the prosecution of the work. He next appears as an author in, if possible, a more odious light. The disastrous affair of Minorca at the commencement of the war of 1756 had rendered the ministry unpopular. Mallet was employed to divert the public odium, and turn it upon the unfortunate Admiral Byng. For this purpose he wrote a paper under the character of *A Plain Man*, in which the disgrace brought upon the British arms in the affair of Minorca was entirely imputed to the cowardice of the admiral. It was circulated with great industry. How cruelly it effected its purpose need not be told. Byng is now universally considered to have been offered up as a victim to the popular clamour which was thus raised against him, rather than from actual demerit in his conduct. "The price of blood," says Dr. Johnson, with fearful but just severity, "was a pension which Mallet retained till his death." He continued to exercise his talent for poetical composition, and published a collection of his works dedicated to great patrons. At the beginning of the reign of George III., when Lord Bute was placed in power, Mallet, who never let an opportunity slip for serving his own interests, enlisted under the ministerial banners, and offered a twofold service to the cause by his *Truth in Rhyme*, and a tragedy called *Elvira*, imitated from La Motte, and applicable to the politics of the day. His reward was the place of keeper of the book of entries for the port of London. The *Critical Review* of that period praised the tragedy in the highest degree; but it is asserted that Mallet had the superintendence of that publication, and was the critic of his own works. On the death of the celebrated Duchess of Marlborough in 1744, it was found by her will that she left to Mr. Glover, the author of *Leonidas*, and Mr. Mallet jointly, the sum of £1000, on condition that they drew up from the family papers a history of the life of the Great Duke. The legacy,

however, was found to be clogged with so many unpleasant restrictions, that Glover, with the true independence of a man of genius, declined any share in the onerous task. Mallet, who never was troubled by any misgiving of conscience, accepted the legacy under all stipulations, and was put in possession of the papers necessary for proceeding with the work. The second Duke of Marlborough, in order to stimulate his industry, added in the most liberal manner an annual pension to the legacy. Mallet pretended all along that he was deeply engaged in forwarding the work for publication, and in a dedication to his grace of a collection of his poems, he spoke of having soon the honour of dedicating to him the life of his illustrious predecessor. But on the death of Mallet, not a vestige of any such work could be found, nor did it appear that, after all the money he had received, he had even written a line of it. While he continued to delude his patron and friends with the expectation of seeing his great work appear, he made the imposition subservient to his interest in many ways. In a familiar conversation with Garrick, and boasting of the diligence which he was then exerting upon the *Life of Marlborough*, he hinted, that in the series of great men quickly to be exhibited, he should find a niche for the hero of the theatre. Garrick professed to wonder by what artifice he could be introduced, but Mallet let him know, that by a dexterous anticipation he should fix him in a conspicuous place. "Mr. Mallet," says Garrick, in his gratitude of exultation, "have you left off to write for the stage?" Mallet then confessed that he had a drama in his hands—Garrick promised to act it, and *Affred* was produced.

Mallet, finding his health in a declining state, went, accompanied by his wife, to the south of France, for the benefit of a change of air; but after some time, finding no improvement, he returned to England, where he died on the 21st April, 1765. Dr. Johnson says, "His stature was diminutive, but he was regularly formed. His appearance, till he grew corpulent, was agreeable, and he suffered it to want no recommendation that dress could give it." His second wife is reported to have been particularly proud, and anxious that he should, at all times, appear like a man of the first rank. She reserved to herself the pleasing task of purchasing all his fine clothes, and was always sure to let her friends know it was out of her fortune she did so. As Mallet was what is called a free-thinker in religion, his wife also, who prided herself in the strength of her understanding, scrupled not, when surrounded at her table with company of congenial opinions, amongst whom it is said Gibbon was a frequent guest, to enforce her dogmas in a truly authoritative style, prefacing them with the exclamation of "Sir—We Deists." As an additional proof of the vanity and weakness of this well-matched pair, we subjoin the following anecdotes from Wilkes' *Correspondence* and Johnson's *Lives of the Poets*:—

"On his arrival from the north he became a great declaimer at the London coffee-houses against the Christian religion. Old surly Dennis was highly offended at his conduct, and always called him 'Moloch.' He then changed his name to Mallet, and soon after published an epistle to Mr. Pope on *Verbal Criticism*. Theobald was attacked in it, and soon avenged himself in the new edition of Shakespeare: 'An anonymous writer has, like a Scotch pedlar in wit, unbraced his pack on the subject. I may fairly say of this author, as Falstaff says of Poins—'Hang him, baboon, his wit is as thick as Tewkesbury mustard; there is no more conceit in him than a mallet.'—Preface, p. 52, edition of 1733. This

Malloch had the happiness of a wife who had *faith* enough. She *believed* that her husband was the greatest poet and wit of the age. Sometimes she would seize his hand and kiss it with rapture, and if the looks of a friend expressed any surprise, would apologize that it was the dear hand that wrote those divine poems. She was lamenting to a lady how much the reputation of her husband suffered by his name being so frequently confounded with that of Dr. Smollett. The lady answered, 'Madam, there is a short remedy; let your husband keep his own name.'

"When Pope published his *Essay on Man*, but concealed the author, Mallet entering one day, Pope asked him slightly what there was new. Mallet told him that the newest piece was *something* called an *Essay on Man*, which he had inspected idly, and seeing the utter inability of the author, who had neither skill in writing nor knowledge of the subject, had tossed it away. Pope, to punish his self-conceit, told him the secret."

"Mallet's conversation," says Dr. Johnson, "was elegant and easy, his works are such as a writer, bustling in the world, showing himself in public, and emerging occasionally from time to time into notice, might keep alive by his personal influence; but which, conveying but little information, and giving no great pleasure, must soon give way, as the succession of things produces new topics of conversation and other modes of amusement."

A daughter, by his first wife, named Cileisia, who was married to an Italian of rank, wrote a tragedy called *Almida*, which was acted at Drury Lane theatre. She died at Genoa in 1790.

MANSFIELD, EARL OF. See MURRAY (WILLIAM).

MARCHMONT, EARL OF. See HUME (PATRICK).

MARISCHAL, EARL. See KEITH (GEORGE).

MARSHALL, HENRY, M.D. This distinguished medical practitioner, whose observant habits and indefatigable application were so successfully employed in improving the health of the British army, was born in the parish of Kilsyth, in 1775. Although his father was a man of humble station and slender means he was not sparing in the expense of education, so that two of his sons enjoyed the benefit of a college training. Of these Henry, who was a medical student, was appointed in May, 1803, surgeon's-mate in the royal navy, but he left that service in September of the following year, and in January, 1805, was appointed assistant-surgeon to the Forfarshire regiment of militia. In April, 1806, he became assistant-surgeon to the first battalion of the 80th regiment, with which he embarked in February, 1807, for South America, and subsequently to the Cape of Good Hope and Ceylon. But already he was distinguished by that observant spirit, and those habits of systematic application, which he so effectually brought to bear upon his own department of the medical profession, and the health and comforts of the British soldier. "We find him," writes his biographer,¹ "when a mere lad at the Cape, in the beginning of the century, making out tables of the diseases of the soldiers, of the comparative health of different stations, and ages, and climates; investigating the relation of degradation, ignorance, crime,

and ill-usage, to the efficiency of the army and to its cost; and from that time to the last day of his life devoting his entire energies to devising and doing good to the common soldier. And all this, to say the least of it, without much assistance from his own department (the medical) till the pleasant time came when the harvest was to be reaped, and the sheaves taken victoriously home."

In May, 1809, Dr. Marshall was appointed assistant-surgeon to the 2d Ceylon regiment, and in April, 1813, promoted to be surgeon of the 1st Ceylon regiment. Although removed to the staff at the close of the latter year, he continued to serve in the island till the spring of 1821, when he returned home, and was soon after appointed to the staff of North Britain, with Edinburgh for his principal station. In 1823 he was removed from Edinburgh to Chatham, and in April, 1825, was appointed to the recruiting dépôt, Dublin. During 1829 he was attached to the war office; and in 1830, by Lord Hardinge, secretary-at-war, he was promoted to the rank of deputy-inspector of hospitals. With this his active service in the army was ended, and he was placed on half-pay.

In the summer of 1832, and when he had reached his fifty-seventh year, usually considered a perilous approach to old age, Dr. Marshall married Anne, eldest daughter of James Wingate, Esq., of Westshiels, and the union was such a happy one, that he often termed it the best earthly blessing of a long and happy life. "I got," he added, "what I was in search of for forty years, and I got this at the very time it was best for me, and I found it to be better and more than I ever during these forty long years had hoped for." Even though no children blessed the union, this happy domestic life was extended to a greater length than could have been anticipated, as his death occurred on the 5th of May, 1851, at Edinburgh, where he had lived for many years. When this event arrived it found him cheerful and happy, and his dying words were a grateful acknowledgment of the blessings which had thrown a continual sunshine upon his lengthened career. "In many respects," he said, "I consider myself one of the most fortunate individuals who ever belonged to the medical department of the army. Through a long life I have enjoyed almost uninterrupted good health, and my duties have been a pleasure to me. Having generally had some literary undertaking on hand, more or less connected with military hygiene, I have enjoyed much intellectual gratification. 'To labour diligently, and to be content (says the son of Sirach), is a sweet life.' My greatest delight has been to promote amelioration of the condition of soldiers, and in the prosecution of this important object I hope I have done some good. I have much reason to be grateful to divine Providence for the many blessings I have enjoyed, and continue to enjoy. Although my elementary education was extremely limited, my professional instruction defective, and my natural talents moderate, I have no reason to complain of my progress and standing in the service. Every step of advancement which I gained in the army was obtained without difficulty. When I look back upon my progress in life, it seems to me that I have been led 'in a plain path,' and that my steps have been 'ordered.'"

In this sketch we have briefly detailed in their consecutive order the principal events of the life of Dr. Henry Marshall. But the most important portion of his biography has still to be added: this was the history of his authorship, which was directed from the beginning to the close with singleness of eye and aim to his life's great purpose, and as he himself

¹ John Brown, M.D., from whose article "Dr. Henry Marshall and Military Hygiene," in series first of *Horæ Subsecivæ*, the particulars of this biographical sketch are derived.

expressed it, "to excite attention to the means which may meliorate the condition of the soldier, and exalt his moral and intellectual character." The productions of his indefatigable pen were the following:—

In 1817, while in Ceylon, he wrote a *Description of the Laurus Cinnamomum*, which was read before the Royal Society at the request of Sir Joseph Banks, and published in the *Annals of Philosophy* of that year.

In 1821, the year of his departure from that island, he published in London, "*Notes on the Medical Topography of the Interior of Ceylon*, and on the Health of the Troops employed in the Provinces during the years 1815 to 1820, with Brief Remarks on the Prevailing Diseases," 8vo, pp. 228. The value of this unpretentious little work was greatly enhanced by its numerical statistics of the mortality and diseases of the troops—a new feature in publications connected with military hygiene.

In 1823 he published, in the *London Medical and Physical Journal*, "Observations on the Health of the Troops in North Britain during a Period of Seven Years, from 1816 to 1822." In this also he made the attempt, which was entirely a new one, to collect and arrange the facts illustrative of the amount of sickness and the ratio of mortality among a body of troops for a specific period.

In 1826, after his removal to the recruiting dépôt, Dublin, Dr. Marshall published in the *Edinburgh Medical and Surgical Journal* (vol. xxvi.) "Practical Observations on the Inspection of Recruits, including Observations on Feigned Diseases."

In 1828 appeared his *Hints to Young Medical Officers of the Army on the Examination of Recruits and the Feigned Disabilities of Soldiers*, London, 8vo, pp. 224. This process of "shamming the doctor" was prevalent in the British army, by which soldiers and recruits disgusted with military service endeavoured by a show of hurts that were disabling, or diseases that were incurable, to procure their discharge. The courage with which these self-inflictions were brought on and nursed for the purpose, would have conferred upon their owners the crown of martyrdom, had they not been procured for a sordid and fraudulent object—and the army doctors were indeed *shammed* by the generality of instances in which the patients returned to full health after their discharge had been obtained. These cases, however, Dr. Marshall was shrewd in detecting; and for the benefit of the service, by imparting his experience to his professional brethren, he produced the above-mentioned little volume. "This," says his biographer, "was the first, and is still the best, work in our language on this subject; the others are mere compilations, indebted to Dr. Marshall for their facts and practical suggestions."

On the appointment of Lord Hardinge in 1828 to the office of secretary-at-war, his lordship was greatly troubled by the amount of the military pension list, which showed 85,515 pensioned soldiers, maintained at an expense to the country of £1,436,663 per annum. A proof of the carelessness also with which the privilege had been granted could be found in the pension list itself, on which 27,625 soldiers were to be found without any causes assigned for their disability. A reform in this military department was necessary, and accordingly a medical board was commissioned "for the purpose of revising the regulations which relate to the business of examining and deciding upon the cases of soldiers recommended for discharge from the service." Dr. Marshall being a member of the board, was able to collect much information on the subject; and on his return to Dublin at the end of the year he forwarded

a new scheme to the secretary-at-war, under the title of *Cursory Observations on the Pensioning of Soldiers*. Soon after a new pension warrant was made, and Dr. Marshall had the satisfaction of finding that its principles were substantially those which he had suggested. Hitherto disabilities, not service, had constituted the chief recommendation to a pension, and we have already seen how readily these disabling tests could be manufactured. But by the new warrant which embodied the doctor's scheme, the claims of the soldier to a pension were founded on—1, Length of service; 2, Wounds received before the enemy; 3, Greatly impaired health after fifteen years' service; and 4, Anomalous disabilities. Having thus found his way upon a very important track, Dr. Marshall in 1829 published a paper in the *United Service Journal* (part ii.), entitled "Observations on the Pensioning of Soldiers," in which he detected and exposed the numerous frauds committed in the army by the erasure and alteration of figures, which had been practised in almost every regiment in the service, and had only been lately detected. In 1829 he communicated *Historical Notes on Military Pensions*, and in 1830 *Notes on Military Pensions*, also to the same journal.

In 1830 Dr. Marshall communicated to Lord Hardinge a paper on the evils occasioned by intoxicating liquors to the European troops in India; and impressed by the importance of the subject, and the necessity of giving it due publicity, he published in the same year an abstract of his paper in the *Edinburgh Medical and Surgical Journal* (vol. xli.), under the title of "Observations on the Abuse of Spirituous Liquors by the European Troops in India, and of the Impolicy of uniformly and indiscriminately issuing Spirit Rations to Soldiers." This practice was such a confirmed military regulation, and therefore so completely a part of the soldier's duty, that he was obliged to swallow nearly half-a-pint of spirits *per diem*, while in some cases a commissioned officer stood over him, to certify the fact that he had actually swallowed his allowance of alcoholic rations. No better expedient could have been devised of converting soldiers into drunkards, and inoculating them with all the moral and physical maladies which originate in such a practice. It is gratifying, however, to add, that within a week after he had received the doctor's paper, Lord Hardinge had commenced measures for the abolition of the indiscriminate issue of spirit allowances to soldiers on board ship and on foreign stations.

Dr. Marshall having drawn up instructions for the guidance of medical officers in examining recruits, Lord Hardinge thought that the publication of this document, which was the result of a laborious and difficult inquiry, together with the pensioning warrant and other relative papers, accompanied with an explanatory comment, would be useful for the information of army officers in general. In consequence of this desire Dr. Marshall, in 1832, published his work "*On the Entlisting, the Discharging, and the Pensioning of Soldiers*, with the Official Documents on these Branches of Military Duty." London, 8vo, pp. 243.

In 1833, in the *Edinburgh Medical and Surgical Journal* (vol. xl.), he published "Contributions to Statistics of the Army, with some Observations on Military Medical Returns," No. I., which in the same year was followed by "Contributions to Statistics of the Army," No. II.

In the same journal he also published, in 1834, "Sketch of the Geographical Distribution of Diseases;" "Abstract of the Returns of the Sick of the Troops belonging to the Presidency of Fort George, Madras, for the years 1827 to 1830," and an article

"On the Mortality of the Infantry of the French Army."

In 1835 he contributed "Observations on the Influence of a Tropical Climate upon the Constitution and Health of Natives of Great Britain," which appeared in vol. xlv. of the *Edinburgh Medical and Surgical Journal*; and in the same year his "Contributions to Statistics of the British Army," No. III., appeared in that periodical.

Dr. Marshall having been appointed in 1835, in conjunction with Sir A. M. Tulloch, to investigate the statistics of the sickness, mortality, and invaliding of the British army, their report in reference to the troops in the West Indies was laid before parliament in the following year. Its effect was completely to dispel a ruinous delusion which had hitherto prevailed in regard to the army. Soldiers had been doomed to nine or ten years of service in the unhealthy Jamaica station, under the idea that by such a length of time they would become effectually "seasoned" to the climate, and fitted to withstand its worst. But the soldiers sentenced to such a charnel-house, and for such a length of time, were apt to abandon themselves to recklessness or despair, and those whom the noxious climate might have spared died under the effects of drunkenness and the use of salted provisions. It is enough to say that the ratio of soldiers' deaths in Jamaica was one in seven annually—a far greater waste than that of the most destructive campaign. These evils, illustrated in the report by incontrovertible statistics, produced a change which has been termed an absolute revolution in this department of military polity; and the long period of service formerly confined to Jamaica was divided between that colony and the Mediterranean station and British America. In this way the destructive "seasoning" delusion came to an end; while a salutary change was introduced into the garrison diet, mode of living, and other sanitary regulations, by which an immense saving both of life and public expenditure was effected.

In 1837 Dr. Marshall's "Contribution to Statistics of the Sickness and Mortality which occurred among the Troops employed on the Expedition to the Scheldt, in the year 1809," appeared in vol. xlviii. of the *Edinburgh Medical and Surgical Journal*.

In 1839 he published in vol. I. of the same journal, "Contributions to Statistics of Hernia among Recruits for the British and Conscripts for the French Army."

In 1839 he also published at Edinburgh a second edition of his former work, *On the Enlisting, Discharging, and Pensioning of Soldiers, with the Official Documents on these Branches of Military Duty*.

In 1846 Dr. Marshall's *Military Miscellany* issued from the press; an interesting volume, exhibiting the principal phases of military life, sketched in a vigorous and effective style. So much of hardship, of injustice, and crime was mixed up in such a mode of life, and so much to deter from it, that the author's friends endeavoured to dissuade him from publishing his work, by representing that it would stir up dissatisfaction in the ranks and resentment among the officers. But on the contrary, it acted as a powerful auxiliary in those army reforms which were already under consideration, and its pages were frequently quoted as authorities both in parliament and from the press. Among the other beneficial changes in the army, two important ones were supposed to have been effected chiefly through the influence of Marshall's *Military Miscellany*. The term of service, which was formerly for life, is now limited to twelve years in the cavalry and ordnance, and ten in the infantry; while the punishment of flogging, which

could not be wholly abrogated, was in no case to exceed fifty lashes.

In 1849 Dr. Marshall published his last of a long series of volumes and articles on military subjects, under the title of *Suggestions for the Advancement of Military Medical Literature*, and it was prompted by the generous desire of qualifying others to fill his place, which would soon be a void. While employed in it he was labouring under the disease that ended him, one of the most painful and terrible of those ills which flesh is heir to; but although aware of its mortal character, and worn out with old age and pain, he was still cheerful with his friends, and anxious to promote their enjoyment. In reference also to his own sufferings he used to say, "This is bad, very bad, in its own way as bad as can be, but everything else is good. My home is happy; my circumstances are good; I always made a little more than I spent, and it has gathered of course; my life has been long, happy, busy, and I trust useful, and I have had my fill of it; I have lived to see things accomplished which I desired, ardently longed for, fifty years ago, but hardly hoped ever to see." Happy is the man who can wind up the business of life in such a spirit and amidst such retrospections!

The authorship of Dr. Marshall had now come to an end, and his writings in connection with military statistics and hygiene had produced such practical results as it would not be easy to estimate. He was born for a purpose, and well was his mission accomplished. In speaking of him, one of his distinguished contemporaries has pronounced the following eulogium: "He was the first to show how the multiplied experience of the medical officers of the British army at home and abroad, by methodical arrangement and concentration, might be applied by the use of computation, to furnish exact and useful results in medical statistics, medical topography, the geographical relations of diseases, medical hygiene, and almost every other branch of military medicine. Dr. Marshall must indeed be regarded as the father and founder of military medical statistics, and of their varied applications." In the foregoing list of his writings we have not included his history and description of Ceylon, which is still the shortest, fullest, and best of all the accounts of that important outpost of our great Indian empire, nor the numerous original papers which he wrote upon various subjects of natural philosophy and medical science. In turning from his literary and professional to his private character, there was also much to admire. His devout religious disposition may be surmised not only from the course of his life, which was the steadfast conscientious fulfilment of the duties imposed upon him, but his happy frame of mind, and cheerful submission to the divine will amidst the infirmities of old age and the inflictions of acute suffering. The picture is completed by Dr. Brown, his biographer, in the following words:—

"Dr. Marshall, as may readily be supposed, was not what the world calls a genius; had he been one, he probably would not have done what he did. Yet he was a man of a truly original mind; he had his own way of saying and doing everything; he had a knack of taking things at first hand; he was original, inasmuch as he contrived to do many things nobody else had done; a sort of originality worth a good deal of 'original genius.' And like all men of a well-mixed, ample, and genial nature, he was a humorist of his own, and that a very genuine, kind: his short stories, illustrative of some great principle in morals or in practical life, were admirable and endless in number; if he had not been too busy about more serious matters, he might have filled a volume

with anecdotes, every one of them at once true and new, and always setting forth and pointing some vital truth. Curiously enough it was in this homely humour that the strength and the consciousness of strength, which one might not have expected from his mild manner and his spare and fragile frame, came out; his satire, his perfect appreciation of the value and size of those he had in view, and his 'pawky' intuition into the motives and secret purposes of men, who little thought they were watched by such an eye—was one of the most striking and gravely comic bits of the mental picturesque; it was like mind looking at and taking the measure and the weight of body, and body standing by grandly unconscious and disclosed; and hence it was that, though much below the average height, no one felt as if he were little—he was any man's match. His head and eye settled the matter; he had a large compact commanding brain, and an eye singularly intelligent, inevitable, and calm. . . . Though out of the service, he was constantly occupied with some good work, keeping all his old friends, and making new and especially young ones, over whom he had a singular power; he had no children, but he had the love of a father for many a youth, and the patience of a father too. . . . Had such a man as Dr. Marshall appeared in France, or indeed anywhere else than in Britain, he would have been made a baron at the least. He did not die the less contented that he was not; and we must suppose that there is some wise though inscrutable final cause why our country, in such cases, makes virtue its own and only reward, and is *leonum aride nutrix*—a very dry nurse indeed."

MAXWELL, SIR MURRAY. This gallant and distinguished naval officer was a son of Alexander Maxwell, Esq., merchant in Leith, and one of nine brothers, among whom six devoted themselves to the service of their country, and three attained respectable positions, one as a general, and two as post-captains in the royal navy. Having chosen the latter service for his profession, Murray commenced his naval career under Sir Samuel Hood, and, after the usual steps in the service, was commissioned as a lieutenant in 1796, and promoted to the command of the *Cyane* sloop of war, at the Leeward Islands, in December, 1802. In 1803 his sloop formed part of Commodore Hood's squadron at the reduction of St. Lucia; and immediately after the capture of that island he was advanced to the command of the *Centaure*, a third-rate, that carried the commodore's broad pendant. In the following autumn he served at the capture of Tobago, Demerara, and Essequibo; and in August, 1803, had his commission as post-captain confirmed by the admiralty. This war among the West India Islands having continued until every colony possessed by the enemy in Dutch Guiana was captured except Surinam, a united expedition was undertaken against it in 1804, the naval armament being commanded by Commodore Hood, and the land force by Major-general Sir Charles Green. The expedition was successful: the valuable colony of Surinam was added to the British dominions; and upon this occasion Captain Maxwell, whose services were in the land attack, was so highly distinguished as to be especially commended in the official report that was sent home. From the *Centaure* he was removed in the summer of 1805 into the *Galatea* frigate, and in the year following into the *Alceste*, of 46 guns, that had previously been *La Minerve*, one of the French frigates captured by part of Sir Samuel Hood's squadron in 1806.

The *Alceste* was now to acquire distinction in the VOL. III.

British navy through the active and adventurous spirit of him who commanded it. This was especially the case in April, 1808, when Captain Maxwell was cruising off Cadiz. Having observed a fleet of Spanish vessels coming along-shore from the northward, under the protection of about twenty gun-boats and a formidable train of flying artillery, he prepared to attack them as soon as they arrived off Rota. With his little squadron, consisting of the *Alceste*, the *Mercury*, 28, and the *Grasshopper* brig, he bore down upon the enemy, and a keen engagement commenced, that lasted from four in the afternoon until half-past six. The daring character of this attack will be understood from the fact that the wind was blowing dead from the shore, so that the British ships were obliged to tack every fifteen minutes in order to avoid the dangerous shoals near Rota; and eleven French and Spanish line-of-battle ships were then lying near, ready for sea, and might at any time have effectually interposed. At the end of the engagement two of the Spanish flotilla were destroyed, the rest compelled to retreat, and the batteries at Rota silenced. Many of the merchantmen being also driven on shore, the boats of the frigates were manned and sent against them; and seven tartans loaded with valuable ship-timber were boarded and brought off from under the very muzzles of the enemy's guns, and in spite of the numerous armed barges and pinnaces which arrived from Cadiz in their defence.

After several successful engagements on the coasts of France and Italy, in which Captain Maxwell acted under the command of higher officers, an opportunity arrived of signaling himself in an adventure that was more exclusively his own. The little fleet under his command, the *Alceste*, *Active*, and *Unité*, having been driven by violent winds from their anchorage, and compelled to take shelter in Lissa, were roused by a telegraphed signal of "three suspicious sail south." The British ships were warped out of port as soon as the wind would permit, and having spread all sail in chase, they sighted the enemy on the 29th of December, 1811, off the island of Augusta. They were three French frigates, which at first bore up, and seemed inclined for action; but on observing the courageous front of their antagonists, who were eager for the combat, they altered their course under a full press of sail, the British following in their wake. One of the French ships, *La Persanne*, of 26 guns, having detached itself from the squadron, Captain Maxwell sent the *Unité* in pursuit of her, and after a running fight of several hours *La Persanne* surrendered to the *Unité* in the afternoon. In the meantime the *Alceste*, having come up with the other two French ships, encountered the commodore, but in the heat of the combat a shot brought down the *Alceste's* maintop-mast, which compelled her to drop astern, at which disaster the Frenchmen raised an exulting shout of "Vive l'empereur!" But their triumph was only for a moment, for the *Active*, with every sail spread, came up with them, and engaged the hindmost vessel, so that the *Alceste*, although crippled, was able to renew her fight with the commodore; and so well were her guns plied, that, after a fight of more than two hours, the French commander was glad to sheer off, while the *Alceste* was unable to follow. The other French vessel, however, *La Pomone*, of 44 guns and 322 men, surrendered after a long and desperate resistance. If anything could add to the satisfaction of this capture, it was, that the *Pomone* had been built and presented by the citizens of Genoa to Jerome Bonaparte, the brother of the emperor, on his attaining the rank of captain in the French navy. What was thus meant

to be the earnest of future triumphs over the "meteor flag of England," became a trophy of the enemy's disappointment and defeat.

The scanty gleanings of our naval warfare with France having been all gathered in, there remained little service for Captain Murray Maxwell, except such as was of a peaceful and diplomatic character. It was here, however, that he was to win his chief distinction, after having proved himself a brave skillful sailor. The first event of this change of career proved unfortunate, for on the 2d of July, 1813, he was wrecked in the *Dædalus* frigate on a shoal near Ceylon while conveying a fleet of Indiamen to Madras. In October, 1815, he was reappointed to the command of the *Alceste*, at the particular desire of Lord Amherst, who was to embark in this ship on his embassy to China.

Upon this notable mission the *Alceste* sailed from Spithead on the 9th of February, 1816, and after touching at Madeira, the Cape of Good Hope, and other places, finally anchored in the Gulf of Pe-tche-lee on the 28th of July. The brig *Lyra*, the consort of the *Alceste*, commanded by Captain Basil Hall, had been previously sent forward to announce the coming of the embassy. Lord Amherst landed at the mouth of the Pei-ho on the 9th of August, and as it was certain that several months must elapse before his lordship could return from Peking to Canton, from the latter of which cities he meant to embark for England, Captain Maxwell resolved to employ the interval in exploring the hitherto unknown coasts of that part of the Chinese empire, taking the northern side to himself, and assigning the southern to Captain Hall in the *Lyra*. It was an exploration that tended both to the correction and enlargement of geographical science. A partial survey was first made of the Gulf of Leo-tong, which no European ship had yet visited. While the *Alceste* coasted along the western shore, a view was obtained of the great wall of China, stretching in its miraculous length over hill and valley. Then standing across to the opposite shore, Captain Maxwell proceeded to the southward, until he reached the extreme Tartar point of the gulf; and holding onward in his course, passed through a cluster of islands between the Gulf of Pe-tche-lee and the Yellow Sea, which he named the Company's Group. He then stood to the eastward, and put into Che-a-tow Bay, on the coast of Shantung; and here he met the *General Hewitt* Indiaman, commanded by Captain Walter Campbell, which had been employed in exploring the central passage of the Gulf of Pe-tche-lee. Soon after they were joined by Captain Hall in the *Lyra*, who had obtained a complete knowledge of that part of the gulf lying between the Pei-ho and their place of rendezvous. From Che-a-tow Bay the *Alceste* and *Lyra* sailed on the 29th of August, and commenced an examination of the south-west coast of Corea, the inhabitants of which were shy of holding intercourse with these strangers, being ordered to that effect by their jealous government. Notwithstanding this half-hostile reception, Captain Maxwell was enabled to rectify a very great error of our geographical maps respecting the peninsula of Corea, and to find that the mainland of Corea was from 100 to 130 miles farther to the eastward than our charts had indicated. He also discovered that thousands of little islands forming an archipelago existed in that quarter—a fact hitherto undreamed of in Europe.

The next advance in this trip of nautical discovery brought our adventurers to the Great Loo-choo Island on the 16th of September; but the particulars of this visit it is unnecessary to describe, as they are so generally known through Captain Hall's popular

work of a *Voyage to Corea and the Island of Loo-choo*. It is enough to state, that at first their reception was as cold as at Corea, and from the same cause—that the natives were at length won over by the courtesy and kindness of their visitors—and that both island and people appeared in such a paradisaical state as to realize Stephano's vision of a perfect republic in Shakspeare's drama of the *Tempest*. "No swords, no poniards, no arrows among them—bah!" was their brief eulogy from Napoleon in St. Helena. His contempt might have been lessened if he had known that the people of Loo-choo had the cunning to hide their fighting gear and their vices from the eyes of their European visitors, as appears to have been the case. Having ended their exploratory cruise, the *Alceste* and *Lyra* arrived off Lin-tin on the 2d of November.

In the meantime this scientific poking into gulfs and bays, and attempts at opening an intercourse with the people of their remote provinces, were anything but agreeable to the Chinese government. A "barbarian eye" was among them—for so in their arrogance they termed a British ambassador; but that, like the peacock, he should also carry a hundred eyes in his tail, and that these should take the liberty of prying everywhere, was more than they could permit, or even comprehend. The government of China had been established by conquest, and was maintained by force; it was the precarious despotism of thousands over millions; and the ruling party were an alien people, between whom and the conquered no common reciprocity existed. It was therefore an essential principle of the dominant race to keep the ruled in ignorance of their own strength; and one of the chief means for this purpose was to prevent their intercourse with all strangers, and confine them within the limits of that sluggish contentedness which had become a chief feature of the Chinese character. This jealousy of the government at the arrival of the ambassador, and the sojourn of two British armed ships in their seas, was soon to break out into action. On their return from Loo-choo the *Alceste* and *Lyra* arrived off Lin-tin on the 2d of November, and Captain Maxwell applied to the viceroy of Canton through the local authorities for a pass to carry the *Alceste* up the Tigris to obtain a secure anchorage, and for the ship to undergo some necessary repairs. But this polite application was only answered by evasions accompanied with insulting messages. Seeing that nothing was to be gained by courtesy, Captain Maxwell resolved to proceed without leave, but had scarcely approached the narrow entrance of the river when an inferior mandarin came on board, and in an imperious tone demanded that the ship should be instantly anchored—threatening that otherwise, if the ship presumed to pass the Bocca, she should be sunk by the fire of the batteries. Knowing that to yield to such a demand would have implied unreserved submission, and that it would be followed by others still more unreasonable and dangerous, Maxwell told the mandarin that he would first pass the batteries, and then hang him at the yard-arm for bringing such an insolent message—and to show that this was no empty threat, the functionary's boat was cut adrift, and himself taken into custody. The *Alceste* was then ordered to be steered close under the principal fort, which opened a heavy fire, aided by seventeen or eighteen war-junks; but their cannonade was ill-directed, and did little harm: on the other hand, the *Alceste's* return of a broadside from her 32-pounders silenced the flotilla and the battery; and the other batteries being quickly disposed of, the ship proceeded without further annoyance to Whampoa, to await the return of Lord Am-

herst in January, 1817. This decisive conduct of Captain Maxwell set matters to rights with the Chinese government. Finding that he was not to be awed into submission, they sent all manner of supplies to his ship, that he might be the sooner gone; and to conceal the havoc made by his guns, and his forcible passage up the river, they represented the affair of the forts as a mere salute of ceremony given and received in the passing. The viceroy of Canton also sent down a mandarin of high class, accompanied by a Hong merchant, to wait upon Captain Maxwell, and welcome him into the river!

Lord Amherst and his suite having arrived at Whampoa, the *Alceste* set sail with them on the 21st of January, 1817, and entered the Straits of Gaspar on the 18th of February. Hitherto the charts had conducted them faithfully, wind and weather were fair and prosperous, and they were hoping for a rapid passage into the Java Sea, when the *Alceste* struck suddenly upon a sunken rock three miles distant from Pulo Leat, or Middle Island, and after striking heeled slightly to starboard, and became immovable. It was soon evident that the condition of the ship was highly dangerous, for her false keel was seen floating alongside, while the water had risen seven feet in the hold, and was fast gaining on the pumps. The order for hoisting out the boats was executed with the utmost coolness and regularity, the barge conveying the ambassador and his suite, and after exploring the shore of Pulo Leat, which at a distance appeared to be land covered with wood, they found on approaching it that it was nothing but insulated masses of granite, interspersed with mangrove-trees growing on the water. Having at length found a landing-place, the ship's company were conveyed thither, with a small stock of baggage, stores, and provisions that had been saved from the wreck; and during the whole of this dangerous crisis the self-possession, courage, and provident care of Captain Maxwell called forth universal admiration. After trying to save the ship, but in vain, his principal care was for the safety of the ambassador; and it was resolved that he and his suite should sail to Batavia, which was 107 miles distant, in the pinnace, while the rest should remain on that desolate coast until relief could be sent to them. Accordingly the pinnace was furnished with four or five days' provisions, and a picked crew commanded by the junior lieutenant of the *Alceste*, having for its consort one of the cutters to pilot and aid them, and the ambassador set off upon a voyage not often paralleled in the records of diplomacy. The adventure, however, although a rare was a successful one, for his lordship reached Batavia in safety.

After the departure of Lord Amherst the crew of the *Alceste* prepared themselves to confront the dangers and difficulties that surrounded them. And seldom has there been a situation so trying, or so bravely overcome. The party amounted to 200 men and boys and one woman. Their first care was to select a safe and healthy encampment, and the place chosen for the purpose was a hill-top, to which they cut a path upwards, and burned the underwood upon the summit, thereby dislodging whole colonies of snakes, scorpions, centipedes, and other noxious reptiles, and swarms of ants almost equally troublesome. For the first two days their sufferings from thirst were great, having saved only a small cask of water from the wreck; and on this account they dug a well in the rocky soil, which, after twenty feet of excavation, yielded a very scanty supply of muddy water: it was indeed so insufficient, that they were fain to avail themselves of a fall of rain, and even to bathe themselves in the sea, that they might quench

their thirst by absorption. The sight of the wreck had drawn multitudes of Malay proas both to the ship and the island, so that, in addition to hunger, thirst, and toil, they had a merciless enemy to contend with; but they prepared themselves for battle, although the means of resistance were so few, being only a dozen cutlasses, about thirty muskets and bayonets, and seventy-five ball cartridges. Somewhere armed themselves with pike-staves, which they made by cutting down young trees, and affixing small swords, dirks, knives, chisels, or large spike-nails to the extremity; others, who had no such metallic resource, sharpened a pole and hardened it at the point in the fire; and orders were given to the marines not to throw away a single shot, unless they were sure of their aim. All were hearty in preparing for their defence, let the enemy be as numerous as they might. Under the direction of the captain, also, the ground they occupied was fortified by a circle of trees felled for the purpose, and set upright, with loose branches interwoven between them, so that it might form a breastwork, and be impregnable to an enemy unprovided with artillery. And to make these preparations for defence complete, all the precautions of a besieged place were established; the officers and men were marshalled into divisions and companies, their various places assigned, and advanced posts established.

Events soon showed that these arrangements were not more than necessary. On the 22d of February, the fourth day after the shipwreck, some Malay boats approached, making signals of peace, but it was evident that their purpose was only to reconnoitre. They had taken possession of the wreck of the *Alceste*, and plundered it; but on being pursued by the ship's boats that were manned for the purpose, they fled, after setting the vessel on fire. Even from the flames, however, our countrymen could obtain some flour, wine, beer, and gunpowder, all and each being of vital importance to the half-starved and beleaguered company. This providential supply was announced on Sunday by the chaplain after divine service, with the intimation that a pint of beer had been immediately ordered to each of them; which tidings the congregation welcomed with three cheers. "I never heard of such a thing as a congregation cheering at a church-door," exclaimed a rigid devotee to the chaplain, when he had returned to England. "Perhaps you never saw such a thing as a thirsty English audience dismissed with the promise of a pint of beer apiece," replied the chaplain.

The appearance of the Malays was but a prelude to the storm. On the 26th two Malay proas approached the cove where the *Alceste's* boats were moored. As the safety of these was of the utmost importance, a party of the crew instantly manned them, and although they had but one musket, they advanced against the pirates, who took to flight; and on being outsailed, they first resisted by firing their swivels, and throwing darts and javelins. They were no match, however, for British sailors in the close hand-to-hand fight that followed, and on finding this they sunk the proa that was attacked, preferring death by drowning to the more terrible end by torture with which their countrymen were usually extirpated when captured. Two Malays, however, who were wounded, were taken prisoners, and their astonishment was extreme, when, on being carried to the encampment, they were tenderly nursed and cured. This skirmish had not been long ended when fourteen other Malay proas and boats arrived on the opposite side of the island; and, thinking from their peaceable demeanour that they had been sent from Batavia by Lord Amherst for their relief, Captain

Maxwell endeavoured to open communication with them. But he soon found that they knew nothing of the ambassador, and that they were only hindered from hostilities by mistaking the place for a regular British settlement. They went off to plunder what still remained of the *Alceste*, and there were joined by fresh accessions of their countrymen, to whom every bolt and nail of the ship seemed an object of great value. Disappointed in their hope of relief, the British were employed in repairing the launch, and constructing a raft, for the purpose of transporting themselves from their barren locality before their stock of provisions was ended; when the Malays, calculating upon the rich plunder of the encampment, turned their fleet towards the island, with tokens of unmistakable hostility, and our countrymen soon found themselves blockaded by fifty boats and proas, carrying at least 500 men. It was now time for the besieged to be on the alert, and anticipating a desperate attack, Captain Maxwell, after making the necessary arrangements to repel it, cheered his company by the following short sailor-like speech:—

“My lads, you must all have observed this day, as well as myself, the great increase of the enemy’s force—for enemies we must now consider them—and the threatening posture they have assumed. I have, on various grounds, strong reason to believe they will attack us this night. I do not wish to conceal our real state, because I think there is not a man here who is afraid to face any sort of danger. We are now strongly fenced in, and our position is in all respects so good, that, armed as we are, we ought to make a formidable defence against even regular troops; what then would be thought of us if we allowed ourselves to be surprised by a set of naked savages, with their spears and creeses? It is true they have swivels in their boats, but they cannot act here: I have not observed that they have any matchlocks or muskets; but if they have, so have we. I do not wish to deceive you as to the means of resistance in our power. When we were first thrown together on shore, we were almost defenceless; only 75 ball-cartridges could be mustered; we have now 1600. They cannot, I believe, send up more than 500 men; but with 200 such as now stand around me, I do not fear 1000, nay, 1500 of them. I have the fullest confidence we shall beat them: the pikemen standing firm, we can give them such a volley of musketry as they will be little prepared for; and when we find they are thrown into confusion, we’ll sally out among them, chase them into the water, and ten to one but we secure their vessels. Let every man, therefore, be on the alert, with his arms in his hands; and should these barbarians this night attempt our hill I trust we shall convince them that they are dealing with Britons.”

This simple address, which was so admirably suited to the audience and the occasion, was welcomed with such loud cheers as were astounding to the besiegers; and instead of proceeding to the attack, they continued their blockade, although during the night they were reinforced by ten more vessels. But this state of uncertainty was intolerable to the besieged, and, in addition to their suspense, they felt that they would soon be reduced by famine, as their stock of provisions was almost exhausted. Any alternative was better than such a result, and they accordingly adopted the desperate resolution of becoming the aggressors, and fighting their way through the enemy, or dying with arms in their hands, rather than submit to such remorseless savages. Well armed, and in their four boats, they resolved to make a sudden and combined attack on the Malayan

flotilla, hoping that by the capture of some of their vessels, at whatever risk or cost of life, they might be able to make for Java. This resolution they adopted with the confidence of brave men to whom fear and hesitation were unknown. A change however occurred that made this desperate experiment unnecessary. From their look-out on the highest peak of the hill a vessel larger than those used by the Malays was descried at noon, and on nearing she was discovered to be either a ship or a brig, standing towards their island under a press of sail. They rejoiced at the sight: it was the coming of their friends; it was the promise of rescue. But far different was the appearance to the pirates, and a sudden rush from the garrison completed their confusion; they got speedily under way, and only escaped a severe chastisement by the speed of their retreat. The ship by whose arrival the siege was raised proved to be the *Ternate*, one of the East India Company’s cruisers, which Lord Amherst had sent from Batavia to relieve them; and the crew of the *Alceste* and their captain having embarked in her on the 7th of March, were comfortably landed on the 9th at Batavia.

Thus happily was terminated the painful sojourn of 200 shipwrecked Britons upon the barren rocky island of Pulo Leat—and the patience, courage, and ingenuity with which they had met every danger and surmounted every trial, formed a theme of admiration for the civilized world at large. Nineteen days had the ordeal lasted, at the close of which they were as brave and confident as ever; and after waiting patiently for the promised assistance until further hope seemed useless, they were ready to free themselves by such resources as still remained to them, and attempt it in the confidence of success. Of their trials during this dreary confinement we have only been able to note a few particulars, while little mention has been made of their brave commander, by whom every operation was directed. And how his conduct was appreciated may be learned from those who shared in, or were cognizant of, his proceedings. In M’Leod’s *Narrative of the Voyage of the Alceste* we have the following testimony:—“It is a tribute due to Captain Maxwell to state (and it is a tribute which all most cheerfully pay), that, by his judicious arrangements, we were preserved from all the horrors of anarchy and confusion. His measures inspired confidence and hope; whilst his personal example in the hour of danger gave courage and animation to all around him.” Equally satisfactory is the following attestation of Mr. Ellis, third commissioner of the embassy:—“Participation of privation and equal distribution of comfort had lightened the weight of suffering to all; and I found the universal sentiment to be an enthusiastic admiration of the temper, energy, and arrangements of Captain Maxwell. No man ever gained more in the estimation of his comrades by gallantry in action than he had done by his conduct on this trying occasion; his look was confidence, and his orders were felt to be security.”

Captain Maxwell, with the officers and crew of the *Alceste*, and Lord Amherst and his suite, returned from Batavia to England in the *Cesar*, and on their voyage the vessel touched at St. Helena, which gave Maxwell the opportunity of an interview with Napoleon. Among other remarks, the fallen emperor observed to him, “Vous étiez très méchant—Eh bien! your government must not blame you for the loss of the *Alceste*, for you have taken one of my frigates.” It was not a bad joke on the part of the illustrious captive; for the *Alceste* had originally been the French frigate *La Minerve*, in the capture of which Captain Maxwell had assisted. How far the British government were from condemning him was shown by the

court-martial held at Portsmouth in August, 1817, upon his return to England, when the following verdict so honourable to himself was given:—"The court is of opinion that the loss of his majesty's late ship *Alceste* was caused by her striking on a sunken rock, until then unknown, in the Straits of Gaspar. That Captain Murray Maxwell, previous to the circumstance, appears to have conducted himself in the most zealous and officer-like manner; and after the ship struck, his coolness, self-collection, and exertions were highly conspicuous; and that everything was done by him and his officers within the power of man to execute previous to the loss of the ship; and afterwards to preserve the lives of the Right Hon. Lord Amherst, his majesty's ambassador, and his suite, as well as those of the ship's company, and to save her stores on that occasion: the court therefore adjudge the said Captain Murray Maxwell, his officers and men, to be *most fully acquitted*." Among the witnesses examined on the trial was Lord Amherst himself, who stated to the court "that he had selected Captain Maxwell on the occasion of the embassy from motives of personal friendship, as well as from the high opinion he entertained of his professional character; which opinion had been much increased by the events of the voyage."

It was a natural sequence of such an acquittal that it should be followed by the open approbation of the government, and accordingly Captain Maxwell, who had been nominated a C.B. in 1815, received the honour of knighthood on the 27th of May, 1818. In the same year, however, when he presented himself at the general election as candidate for the parliamentary representation of the city of Westminster, he experienced very different treatment. On such occasions we know how little any amount of merit or public services will avail, if the competitor cannot pronounce the political shibboleth of the district; and he was subjected not only to insult, but severe personal injuries, by the rabble who surrounded the hustings, and constituted themselves the lords of the election. This was even worse than the Malayan leaguer of Pulo Leat, where he understood the situation, and possessed the means of resistance. More than one example has shown us that a seat in parliament is a rock ahead, which our naval heroes do not understand, and of which they would do well to steer clear. On the 20th of May, 1819, Captain Maxwell was presented by the Honourable East India Company with the sum of £1500, for the services he had rendered to the Chinese embassy, and in requital of his losses sustained in his return from China.

In the peaceful season that had succeeded, there was no particular call upon the services of Captain Maxwell, and his rise was therefore dependent upon professional routine. In June, 1821, he was appointed to the *Bulwark*, a third-rate, bearing the flag of Sir Benjamin Hallowell, at Chatham; and in November, 1822, he was removed to the *Briton* frigate. He was afterwards employed on the South American station. On the 11th of May, 1831, he received the appointment of lieutenant-governor of Prince Edward's Island, and was preparing to take his departure from England to his new sphere of office, when his life was terminated by a very short illness on the 26th of June, 1831.

MAYNE, JOHN. This amiable and talented poet was born at Dumfries, on the 26th of March, 1759, and was educated at the grammar-school of that town, under Dr. Chapman, whose learning and worth his grateful pupil afterwards commemorated in the *Siller Gun*. His stay at school was a short

one, and his progress in scholarship afterwards was chiefly accomplished by self-education, as he became a printer at a very early age, and was employed upon the *Dumfries Journal*, which was conducted by Professor Jackson. He had not been long thus occupied when he left Dumfries for Glasgow, to which latter city he accompanied his father's family, and took up his residence with them at the farther extremity of the Green of Glasgow, this locality being commonly called Greenhead by the citizens, who have, time out of mind, been proud of this their place of public recreation on the banks of the Clyde. At a very early period the chief predilection of John Mayne appears to have been towards poetry, and that, too, in his own native dialect, instead of the stately and more fashionable diction of Pope and Addison. In him such a preference was the more commendable, because it was before the poetry of Burns had arrested the decay of our Doric tongue, and given it a classical permanency. It deserves to be noticed, also, that one of Mayne's poems on *Halloween* appears to have suggested to Burns both the subject and style of the happiest production of the national muse of Scotland.

So early as 1777 John Mayne's chief poem, entitled the *Siller Gun*, was published. The history of this poem is curious, as indicative of a mind that steadfastly adhered to a single idea until it had completely matured it, and that would not rest satisfied with an inferior amount of excellence. At first the *Siller Gun* consisted of not more than twelve stanzas, which were printed at Dumfries on a single quarto page. Soon afterwards it was reprinted in the same town, extended into two cantos. It became so popular that other editions followed, in the course of which it swelled into three cantos; afterwards it extended to four, in an edition printed in 1808; and when the last version, with the author's improvements and final corrections, appeared in 1836, the same year in which he died, the poem, that originally consisted of only a dozen stanzas, had expanded and grown into five goodly cantos. It should be mentioned, also, that this unwonted process of amplification had by no means impaired either the strength or the excellence of the original material; on the contrary, every successive edition was an improvement upon its predecessor, until the last was also the best.

This poem, at present too little known compared with its remarkable merit, is founded upon an ancient custom in Dumfries, called "shooting for the siller gun." This practice, strangely enough, was instituted by James VI., who, of all sovereigns, was the one most averse to every kind of lethal weapon, and has continued till modern times, while the events of such a weapons-haw were generally well adapted for the purposes of a comic poet. Mr. Mayne selected that trial which was held in 1777; and in his subsequent editions he took the opportunity of introducing many of the public characters of his native Dumfries, who were wont to figure at these annual competitions. The preparations for the festival are thus humorously described:—

"For weeks before this fete sae clever,
The fowk were in a perfect fever,
Scouring gun-barrels in the river—
At marks practising—
Marching wi' drums and fifes for ever—
A' sodergerizing.

"And turning coats, and mending breeks,
New-seating where the sark-tail keeks;
(Nae matter though the clout that eeks
Be black or blue);
And darning with a thousand steeks
The hose anew!"

The shooting, as he describes it, was by no means the most efficient kind of practice for the contingency of a French invasion:—

"By this time, now, wi' mony a dunder,
Auld guns were brattling afi like thunder;
Three parts o' whilk, in ilka hunder,
Did sae recoil,
That collar-banes gat mony a lunder
In this turmoil.

"Wide o' the mark, as if to scar us,
The bullets ripp'd the swaird like harrows;
And fright'ning a' the craws and sparrows
About the place,
Ramrods were fleeing thick as arrows
At Chevy Chace."

After the first publication of the *Siller Gun*, Mr. Mayne continued to write poetry, but with that careful fastidiousness, in which quality rather than quantity was the chief object of solicitude. These productions generally appeared in *Ruddiman's Magazine*, a weekly miscellany, and it was there that his *Hallowe'en*, which was to be honoured by such an illustrious successor, first saw the light. He also exchanged verses in print with his fellow-townsmen, Telford, afterwards so distinguished among our Scottish engineers. Among Mayne's few and short poetical productions of this period, may be mentioned his beautiful song of *Logan Water*, which first appeared about the year 1783. The tune of *Logan Water*, one of our most simple and touching old national melodies, for which the verses were composed, and especially the intrinsic merits of the verses themselves, made the song such a universal favourite, that after taking complete hold of Scotland, it was published with the music in England, and established as one of the choice performances of Vauxhall. Burns, also, who mistook it for one of our old Scottish songs, as it was published anonymously, produced an imitation, under the same title, which scarcely equals the original. In simplicity, in tenderness, and classic elegance, we would match the *Logan Water* of Mayne even with the *Fountain of Bandusia* of Horace.

The other chief poetical production of Mr. Mayne, next to the *Siller Gun* in point of extent, was *Glasgow*, a descriptive poem, which was published with illustrative notes in 1803. It is a work of considerable merit, and all the more worthy of attention that it describes a state of men and things that has utterly passed away. Who would recognize in the *Glasgow* of that day the gorgeous Tyre of the west, whose merchants are princes, and whose population is numbered by myriads? In the same year that his *Glasgow* appeared he also published *English, Scots, and Irishmen*, a patriotic address to the inhabitants of the three kingdoms.

Although John Mayne loved his country with all the patriotic ardour of a Scotchman, and celebrated its people and its scenery as few Scotchmen could do, yet, like many of his countrymen, he was doomed, during the greater part of his life, to contemplate it at a distance, and to speak of it to strangers. As a printer his occupation was chiefly with the Messrs. Foulis, of the university press, Glasgow, under whom he entered into an engagement that continued from 1782 to 1787. He visited London, probably for the first time, in 1785; and having been attracted by the facilities that presented themselves there of permanent and profitable occupation, he moved thither in 1787, when his engagement in Glasgow had expired, and, during the rest of his long life, never happened to revisit the land of his nativity. It is well that Scottish patriotism, instead of being impaired, is so often enhanced by the enchantment of distance. In London he was singularly fortunate;

for after the usual amount of enterprise and perseverance in literature, to which all his hopes and energies were devoted, he became printer, editor, and joint-proprietor of the *Star* evening paper. Under his excellent management the journal was a thriving one; and from year to year he continued to indulge his poetical likings not only in its columns, but also in the *Gentlemen's Magazine*, to which he occasionally contributed from 1807 to 1817. After a long life of usefulness and comfort, which extended to seventy-eight years, he died in his residence, No. 2 Lysson Grove, South, on the 14th of March, 1836, and was buried in his family vault, Paddington Church-yard.

As a poet, John Mayne must be allowed a much higher standing than is usually given to the Scottish bards of the present century; and in comparing him, it must be with Ramsay, Fergusson, and Hogg, to whom he approached the nearest, rather than with inferior standards. The moral character of his writings, also, cannot be too highly commended. "He never wrote a line," says a popular author, "the tendency of which was not to afford innocent amusement, or to improve and increase the happiness of mankind." Of his private character Allan Cunningham also testifies that "a better or warmer-hearted man never existed."

MELVILLE, ANDREW, one of the most illustrious of the Scottish reformers, whose name stands next to that of Knox in the history of the Reformation, and is second to none in the erudition of the time, was born on the 1st of August, 1545, at Baldovoy or Baldowy, an estate on the banks of the South Esk, near Montrose, of which his father was proprietor. The form in which the family name was generally known at that time in Scotland and in foreign countries was Melvyn or Melvin. Throughout the interesting correspondence, written in Latin, between the subject of this memoir and his amiable and accomplished nephew, whose life is recorded in the next article, the name is uniformly written Melvinus. In Fifehire, at the present day, the name is commonly pronounced Melvin, and at an earlier period it was frequently both pronounced and written Melin, Mellin, and Melling. The Melvilles of Baldovoy were a family of some note in the middle of the sixteenth century, and near cadets of Melville of Raith, who was considered to be the chief of an influential name in the county of Fife. Melville of Dysart, however, was acknowledged by Andrew Melville to have been the chief of the Baldovoy branch of the family. Andrew was the youngest of nine sons, and had the misfortune to lose his father, who fell in the battle of Pinkie, while he was yet only two years of age. The death of his mother, also, soon afterwards took place, and he was thus left an orphan. The loss of his parents, however, was in a great measure compensated by the kindness and tenderness of his eldest brother and the wife of that individual, both of whom watched over his infant years with the most anxious affection and assiduity. The long-tried and unwearied kindness of the latter, in particular, made a strong impression upon Melville, which lasted during the whole of his life.

His brother, perceiving his early propensity to learning, resolved to encourage it, and with this view gave him the best education which the country afforded. He was besides of a weakly habit of body, a consideration which had its weight in determining the line of life he should pursue. Young Melville was accordingly put to the grammar-school of Montrose, where he acquired the elements of the Latin language, and, among other accomplishments, a

knowledge of Greek, which was then a rare study in Scotland. When removed, in his fourteenth year, to the university of St. Andrews, he surprised his teachers by his knowledge of Greek, with which they were wholly unacquainted. He was indebted for this fortunate peculiarity in his education to a Frenchman of the name of Marsilliers, who had been established as a teacher of Greek in the school of Montrose, by John Erskine of Dun. The great progress which young Melville had made in learning excited the astonishment and attracted the attention of the various teachers in the university; particularly Mr. John Douglas, the rector, who, on one occasion having taken the young and weakly boy between his knees, was so delighted with his replies when questioned on the subject of his studies, that he exclaimed, "My silly fatherless and motherless boy, it's ill to witt [to guess] what God may make of thee yet."

The reputation which Melville acquired soon after entering the college increased with his stay there; and he left it, on finishing the usual course of study, with the character of being "the best philosopher, poet, and Grecian, of any young master in the land." Having acquired all the learning which his native country afforded, he resolved to proceed to the Continent to complete his education; and accordingly, with the consent of his brothers, set out for France in the autumn of 1564, being still only in the nineteenth year of his age. At the university of Paris, whither he repaired, he acquired a similar reputation for general talent, and particularly for his knowledge of Greek, with that which he had secured at St. Andrews. Here he remained for two years, when he removed to Poitiers. On his arrival at the latter place, such was the celebrity already attached to his name, he was made regent in the college of St. Marceon, although yet only twenty-one years of age. From Poitiers he went some time afterwards to Geneva, where he was presented with the humanity chair in the academy, which happened fortunately to be then vacant. In 1574 he returned to his native country, after an absence altogether of ten years. On his arrival at Edinburgh he was invited by the regent Morton to enter his family as a domestic instructor, with a promise of advancement when opportunity should offer. This invitation he declined, alleging that he preferred an academical life, and that the object of his highest ambition was to obtain an appointment in one of the universities. He now retired to Baldov, where he spent the following three months enjoying the society of his elder brother, and amusing himself by superintending the studies of his nephew, James Melville.

At the end of this period he was appointed principal of the college of Glasgow by the General Assembly, and immediately proceeded thither to assume the duties of his office. Here the learning and talents of Melville were eminently serviceable, not only to the university over which he presided, but to the whole kingdom. He introduced improvements in teaching and in discipline, which at once procured a high degree of popularity to the college, and greatly promoted the cause of general education throughout Scotland. Melville possessed a considerable share of that intrepidity for which his great predecessor Knox was so remarkable. At an interview, on one occasion, with the regent Morton, who was highly displeased with some proceedings of the General Assembly, of which Melville was a member, the former, irritated by what he conceived to be obstinacy in the latter, exclaimed, "There will never be quietness in this country till half a dozen of you be hanged or banished." "Hark, sir," said Melville, "threaten your courtiers after that

manner. It is the same to me whether I rot in the air or in the ground. The earth is the Lord's. *Patria est ubicunque est bene.* I have been ready to give my life where it would not have been half so well wared [expended], at the pleasure of my God. I have lived out of your country ten years, as well as in it. Let God be glorified: it will not be in your power to hang or exile his truth." It is not said that the regent resented this bold language; but probably his forbearance was as much owing to the circumstance of his resigning the regency, which he did soon after, as to any other cause.

In 1580 Melville was translated to St. Andrews, to fill a similar situation with that which he occupied at Glasgow. Here he distinguished himself by the same ability which had acquired him so much reputation in the western university. Besides giving lectures on theology, he taught the Hebrew, Chaldee, Syriac, and Rabbinical languages, and discovered such an extent of knowledge and superiority of acquirement, that his classes were attended, not only by young students in unusual numbers, but by several of the masters of the other colleges. In 1582 Melville opened, with sermon, an extraordinary meeting of the General Assembly, which had been convoked to take into consideration the dangerous state of the Protestant church, from the influence which the Earl of Arran, and the Lords D'Aubigné and Lennox, exercised over the young king. In this sermon he boldly inveighed against the absolute authority which the court was assuming a right to exercise in ecclesiastical affairs, and alluded to a design on the part of France, of which D'Aubigné was the instrument, to re-establish the Catholic religion in the country. The assembly, impressed with similar sentiments, and entertaining similar apprehensions, drew up a spirited remonstrance to the king, and appointed Melville to present it. He accordingly repaired to Perth, where the king then was, and, despite of some alarming reports which reached him of the personal danger to which he would expose himself from the resentment of the king's favourites, demanded and obtained access to his majesty. When the remonstrance was read Arran looked round the apartment, and exclaimed, in a tone of defiance and menace, "Who dares subscribe these treasonable articles?" "We dare," replied Melville; and, taking a pen from the clerk, he affixed his signature to the document: an example which was immediately followed by the other commissioners who were with him. The cool and dignified intrepidity of Melville completely silenced the blustering of Arran, who, finding himself at fault by this unexpected opposition, made no further remark; and Lennox, with better policy, having spoken to the commissioners in a conciliatory tone, they were peaceably dismissed. It seems probable, however, from what afterwards ensued, that Arran did not forget the humiliation to which Melville's boldness had on this occasion subjected him. In less than two years afterwards Melville was summoned before the privy-council on a charge of high-treason, founded upon some expressions which, it was alleged, he had made use of in the pulpit. Whether Arran was the original instigator of the prosecution does not very distinctly appear; but it is certain that he took an active part in its progress, and expressed an eager anxiety for the conviction of the accused. Failing in establishing anything to the prejudice of Melville, the council had recourse to an expedient to effect that which they could not accomplish through his indictment. They could not punish him for offences which they could not prove; but they found him guilty of declining the judgment of

the council, and of behaving irreverently before them, and condemned him to be imprisoned in the castle of Edinburgh, and to be further punished in person and goods at his majesty's pleasure. The terms of the sentence, in so far as regarded the place of imprisonment, were afterwards altered by Arran, who substituted "Blackness," where he had a creature of his own as keeper, for Edinburgh. Several hours being allowed to Melville before he was put in ward, he availed himself of the opportunity, and made his escape to England. To this step, being himself in doubt whether he ought not rather to submit to the sentence of the council, he was urged by some of his friends, who, to his request for advice in the matter, replied, with the proverb of the house of Angus, "Loose and living;" which pretty plainly intimates what they conceived would be the result if he permitted himself to be made "fast." On leaving Edinburgh Melville first proceeded to Berwick, and thence to London, where he remained till the November of 1585. The indignation of the kingdom having then driven Arran from the court, he returned to Scotland, after an absence of twenty months. The plague, which had raged in the country while he was in England, having dispersed his pupils at St. Andrews, and the college being, from this and other causes, in a state of complete disorganization, he did not immediately resume his duties there, but proceeded to Glasgow, where he remained for some time. In the month of March following, induced by an appearance of more settled times, he returned to St. Andrews and recommenced his lectures and former course of instruction. These, however, were soon again interrupted. In consequence of the active part which he took in the excommunication of Archbishop Adamson, who was accused of overthrowing the scriptural government and discipline of the Church of Scotland, he was commanded by the king to leave St. Andrews, and to confine himself beyond the water of Tay. From this banishment he was soon afterwards recalled; and, having been restored to his majesty's favour, through the intercession of the dean of faculty and masters of the university, he resumed his academical labours at St. Andrews.

In the year following (1587) he was chosen moderator of the General Assembly, and appointed one of their commissioners to the ensuing meeting of parliament. A similar honour with the first was conferred upon him in 1589, and again in 1594. In the year following he was invited to take a part in the ceremonies at the coronation of the queen, which took place in the chapel of Holyrood, on the 17th of May. On this occasion, although he did not know until only two days before, that he was expected to take a part in the approaching ceremony, he composed and delivered, before a great concourse of noblemen and gentlemen assembled to witness the coronation, a Latin poem, which, having been printed next day at the earnest solicitation of his majesty, who was much pleased with it, under the title of *Stephaniskion*, and circulated throughout Europe, added greatly to the reputation which its author had already acquired. An instance of the generosity of Melville's disposition, which occurred about this time, cannot be passed over, however brief the sketch of his life may be, without doing an injustice to his memory. Archbishop Adamson, one of his most irreconcilable enemies, having lost the favour of the king, was reduced, by the sequestration of his annuity, which immediately followed, to great pecuniary distress. He applied to Melville for relief, and he did not apply in vain. Melville immediately visited him, and undertook to support

himself and his family at his own expense, until some more effective and permanent assistance could be procured for him; and this he did for several months, finally obtaining a contribution for him from his friends in St. Andrews. Such instances of benevolence are best left to the reader's own reflections, and are only injured by comment.

In 1590 he was chosen rector of the university; an office which he continued to hold by re-election for many years, and in which he displayed a firmness and decision of character on several trying occasions, that gives him a claim to something more than a mere literary reputation. Though a loyal subject in the best sense and most genuine acceptance of that term, he frequently addressed King James in language much more remarkable for its plainness than its courtesy. He had no sympathy whatever for the absurdities of that prince, and would neither condescend to humour his foibles nor flatter his vanity. A remarkable instance of this plain-dealing with his majesty occurred in 1596. In that year Melville formed one of a deputation from the commissioners of the General Assembly, who met at Cupar in Fife, being appointed to wait upon the king at Falkland, for the purpose of exhorting him to prevent the consequences of certain measures inimical to religion, which his council were pursuing. James Melville, nephew of the subject of this memoir, was chosen spokesman of the party, on account of the mildness of his manner and the courteousness of his address. On entering the presence he accordingly began to state the object and views of the deputation. He had scarcely commenced, however, when the king interrupted him, and in passionate language denounced the meeting at Cupar as illegal and seditious. James Melville was about to reply with his usual mildness, when his uncle, stepping forward, seized the sleeve of the king's gown, and calling his sacred majesty "God's silly vassal," proceeded to lecture him on the impropriety of his conduct, and to point out to him the course which he ought to pursue, particularly in matters of ecclesiastical polity. "Sir," he said, "we will always humbly reverence your majesty in public; but since we have this occasion to be with your majesty in private, and since you are brought in extreme danger both of your life and crown, and, along with you, the country and the church of God are like to go to wreck, for not telling you the truth, and giving you faithful counsel, we must discharge our duty or else be traitors both to Christ and you. Therefore, sir, as divers times before I have told you, so now again I must tell you, there are two kings and two kingdoms in Scotland: there is King James, the head of this commonwealth, and there is Christ Jesus, the King of the church, whose subject James VI. is, and of whose kingdom he is not a king, nor a lord, nor a head, but a member." Melville went on in a similar strain with this for a great length of time, notwithstanding repeated attempts on the part of the king to stop him. James expressed the strongest repugnance at the outset to listen to him, and endeavoured to frighten him from his purpose by a display of the terrors of offended royalty, but in vain. He was finally compelled to listen quietly and patiently to all that Melville chose to say. At the conclusion of the speech the king, whose anger, and whose courage also probably, had subsided during its delivery, made every concession which was required; and the deputation returned without any loss, apparently, of royal favour. It was not, however, to be expected that Melville should have gained any ground in the king's affections by this display of sincerity and zeal; nor were the future interviews

which took place between them better calculated for this end. The very next which occurred is thus alluded to in his nephew's diary: "And ther they (the king and Melville) heeled on, till all the hous and clos bathe hard mikle, of a large houre. In end the king takes up and dismissis him favour-able."

However favourably James may have dismissed him, he does not seem to have been unwilling to avail himself of the first opportunity which should offer of getting rid of him. At a royal visitation of the university of St. Andrews, which soon afterwards took place, matter of censure against Melville was eagerly sought after, and all who felt disposed to bring any complaint against him were encouraged to come forward with their accusations. The result was that a large roll, filled with charges against him, was put into the king's hands. He was accused of neglecting the pecuniary affairs of the college and the duties of his office as a teacher; of agitating questions of policy in place of lecturing on divinity; and of inculcating doctrines subversive of the king's authority and of the peace of the realm. At several strict examinations he gave such satisfactory explanations of his conduct, and defended himself so effectually against the slanders of those who sought his ruin, that the visitors were left without any ground or pretext on which to proceed against him. They, however, deprived him of the rectorship, on the plea that it was improper that that office should be united with the professorship of theology, the appointment which Melville held in the university.

The accession of James to the English throne did not abate his desire to assume an absolute control over the affairs of the Church of Scotland, and long after his removal to England he continued to entertain designs hostile to its liberties. The attempts which he had made to obtain this supremacy while he was yet in Scotland had been thwarted in a great measure by the exertions of Melville. His intrepidity kept James at bay, and his zeal, activity, and talents deprived him of all chance of succeeding by chicanery or cunning. Melville still presented himself as a stumbling-block in his way should he attempt to approach the Scottish church with inimical designs, and James therefore now resolved that he should be entirely removed from the kingdom. To accomplish this he had recourse to one of those infamous and unprincipled stratagems which he considered the very essence of "kingcraft." In May, 1606, Melville received a letter from his majesty, commanding him to repair to London before the 15th of September next, that his majesty might consult with him, and others of his learned brethren, regarding ecclesiastical matters, with the view of healing all differences, and securing a good understanding between his majesty and the church. Letters of a similar tenor were received by seven other clergymen, amongst whom was Melville's nephew.

Though not without some doubts regarding the result of this rather extraordinary invitation, Melville and his brethren set out for London, where they arrived on the 25th of August. The first interview of the Scottish clergymen with the king was sufficiently gracious. He inquired for news from Scotland, and condescended even to be jocular. This, however, did not last long; at the subsequent conferences Melville found himself called upon, by the sentiments which the king expressed regarding church matters, to hold the same bold and plain language to him which he had so often done in Scotland, and this too in the presence of great numbers of his English courtiers, who could not refrain from expressing their admiration of Melville's boldness, and of

the eloquence with which he delivered his sentiments. In the meantime, however, the Scottish ministers were interdicted from returning to Scotland without the special permission of the king. On the 28th September they were required by his majesty to give attendance in the royal chapel on the following day to witness the celebration of the festival of St. Michael. The ceremonies and fooleries of the exhibition which took place on this occasion were so absurd, and so nearly approached those of the Romish church, that they excited in Melville a feeling of the utmost indignation and contempt. This feeling he expressed in a Latin epigram, which he composed on returning to his lodgings. A copy of the lines found its way to his majesty, who was greatly incensed by them, and determined to proceed against their author on the ground that they were treasonable. He was accordingly summoned before the privy-council, found guilty of scandalum magnatum, and after a confinement of nearly twelve months, first in the house of the dean of St. Paul's, and afterwards in that of the Bishop of Winchester, was committed to the Tower, where he remained a prisoner for four years. The other clergymen who had accompanied Melville to London were allowed to return to Scotland; but they were confined to particular parts of the country, and forbidden to attend any church courts. Melville's nephew was commanded to leave London within six days, and to repair to Newcastle-upon-Tyne, and not to go ten miles beyond that town on the pain of rebellion.

In the month of February, 1611, Melville was released from the Tower on the application of the Duke of Bouillon, who had solicited his liberty from the king, in order to procure his services as a professor in the university at Sedan in France. Melville, who was now in the sixty-sixth year of his age, was exceedingly reluctant to go abroad; but as this was a condition of his liberty, and as there was no hope of the king's being prevailed upon to allow him to return to Scotland, he submitted to the expatriation, and sailed for France on the 19th of April. On his arrival at Paris he was fortunate enough to fall in with one of his scholars, then prosecuting his studies there, by whom he was kindly and affectionately received. After spending a few days in the French capital he repaired to Sedan, and was admitted to the place destined for him in the university. In the year following he removed to Grenoble, to superintend the education of three sons of the treasurer of the parliament of Dauphiny, with a salary of 500 crowns per annum; but not finding the situation an agreeable one, he returned within a short time to Sedan, and resumed his former duties.

Melville continued to maintain a close correspondence with his numerous friends in Scotland, and particularly with his nephew James Melville, to whom he was warmly attached. Of him, his best, most constant, and dearest friend, however, he was soon to be deprived. That amiable man, who had adhered to him through good and bad fortune, through storm and sunshine, for a long series of years, died in the beginning of the year 1614. The grief of Melville on receiving the intelligence of his death was deep and poignant. He gave way to no boisterous expression of feeling; but he felt the deprivation with all the keenness which such a calamity is calculated to inflict on an affectionate heart. With his fondest wishes still directed towards his native land, he requested his friends in London to embrace any favourable opportunity which might offer of procuring his restoration; and in 1616 a promise was obtained from his majesty that he would be relieved from banishment. This promise, how-

ever, like many others of James', was never realized. Melville, after all that he had done for his country, was doomed to breathe his last an exile in a foreign land. To compensate in some measure for the misfortunes which clouded his latter days, he was blessed with a more than ordinary share of bodily health, and that to a later period of life than is often to be met with. "Am I not," he says, in a letter to a friend written in the year 1612, "threescore and eight years old, unto the which age none of my fourteen brethren came; and yet, I thank God, I eat, I drink, I sleep as well as I did these thirty years by-gone, and better than when I was younger—in *ipso flore adolescentiæ*—only the gravel now and then seasons my mirth with some little pain, which I have felt only since the beginning of March the last year, a month before my deliverance from prison. I feel, thank God, no abatement of the alacrity and ardour of my mind for the propagation of the truth. Neither use I spectacles now more than ever, yea I use none at all, nor ever did, and see now to read Hebrew without points, and in the smallest characters." With this good bodily health he also enjoyed to the close of his life that cheerfulness of disposition and vivacity of imagination for which he was distinguished in earlier years, and in the seventy-fourth year of his age he is found vying with the most sprightly and juvenile of his colleagues in the composition of an epithalamium on the occasion of the marriage of the eldest daughter of his patron the Duke of Bouillon.

Years, however, at length undermined a constitution which disease had left untouched until the very close of life. In 1620 his health, which had previously been slightly impaired, grew worse, and in the course of the year 1622 he died at Sedan, in the seventy-seventh year of his age.

The benefits which Melville conferred on his country in the department of its literature are thus spoken of by Dr. Mc'Crie:—"His arrival imparted a new impulse to the public mind, and his high reputation for learning, joined to the enthusiasm with which he pleaded its cause, enabled him to introduce an improved plan of study into all the universities. By his instructions and example he continued and increased the impulse which he had first given to the minds of his countrymen. In languages, in theology, and in that species of poetical composition which was then most practised among the learned, his influence was direct and acknowledged." The services which he rendered the civil and religious liberties of his country are recorded by the same able author in still stronger terms. "If the love of pure religion," he says, "rational liberty, and polite letters, forms the basis of national virtue and happiness, I know no individual, after her reformer, from whom Scotland has received greater benefits, and to whom she owes a deeper debt of gratitude and respect, than Andrew Melville."

MELVILLE, JAMES, with whose history are connected many most interesting facts in the ecclesiastical and literary history of Scotland, was born at Baldov, near Montrose, on the 25th of July, 1556.¹ His father was Richard Melville of Baldov, the friend of Wishart the martyr, and of John Erskine of Dun, and the elder brother of Andrew Melville. Soon after the Reformation, this gentleman became minister of Mary-Kirk, in the immediate neighbourhood of his property, and continued so till the close of his life. He married Isobel Scrimgeour, sister of

the laird of Glasswell, a woman of great "godlines, honestie, vertew, and affection." James Melville was therefore, to use his own expression, descended "of godlie, faithfull, and honest parents, bathe lightened with the light of the gospell, at the first dawning of the day tharof within Scotland."

The mother of James Melville having died about a year after his birth, he was placed under the care of a nurse, "an evill inclynit woman;" and after being weaned was lodged in the house of a cottar, from whence, when he was about four or five years old, he was brought home to Baldov. He and his elder brother David were soon afterwards sent to a school, kept by Mr. William Gray, minister of Logie-Montrose, "a guid, lerned, kynd man." This school was broken up, partly by the removal of some of the boys, perhaps to attend the universities, but more immediately by the ravages of the plague at Montrose, from which Logie was only two miles distant. James and his brother therefore returned home, after having attended it for about five years. During the following winter they remained at home, receiving from their father such occasional instruction as his numerous duties permitted him to give them. At this period Richard Melville seems to have intended that both his sons should be trained to agricultural pursuits, there being no learned profession in which a livelihood, even of a very moderate kind, could be obtained. In the spring it was resolved that, as the elder brother was sufficiently old to assist in superintending his father's rural affairs, he should remain at home, and that James should be sent again to school. He accordingly attended a school at Montrose, of which Andrew Milne, afterwards minister of Fetteresso, was master. Here he continued about two years.

Of the whole of this period of his life James Melville has left a most interesting account; and we only regret that, from the length to which this memoir must otherwise extend, we are unable to give anything more than a very rapid sketch of this and the subsequent part of his education. He entered on his philosophical course at St. Leonard's College in the university of St. Andrews, in November, 1571, under the care of William Collace, one of the regents. At first he found himself unable to understand the Latin prelections, and was so much chagrined that he was frequently found in tears; but the regent took him to lodge at his apartments, and was so much pleased with the sweetness of his disposition, and his anxiety to learn, that he made him the constant object of his care, and had the satisfaction of seeing him leave the university, after having attained its highest honours. During the prescribed period of four years Melville was taught logic (including the Aristotelian philosophy), mathematics, ethics, natural philosophy, and law. At the end of the third year, he, according to the usual custom, took the degree of Bachelor, and on finishing the fourth, that of Master of Arts. One of the most interesting events recorded by James Melville to have occurred during his residence at St. Andrews, was the arrival of John Knox there in 1571; and he alludes with much feeling to the powerful effects produced on his mind by the sermons of the reformer.

After finishing his philosophical education, James Melville returned to his father's house, where he prosecuted his studies during the summer months. Having finished that part of his education which was necessary for general purposes, it was now requisite that he should determine what profession he should adopt. His father had destined him for that of a lawyer; but although James had studied some parts of that profession, and had attended the consistorial

¹ In a note on this date in his *Diary* he says, "My vnclie, Mr. Andro, haulds that I was born in an. 1557."

court at St. Andrews, his heart "was nocht sett that way." Deference to his father's wishes had hitherto prevented him offering any decided opposition to his intentions, but he had at this period taken means to show the bent of his mind. Choosing a passage in St. John's Gospel for his text, he composed a sermon, which he put in a book used by his father in preparing his weekly sermons. The MS. was accordingly found, and pleased his father exceedingly. But James was now luckily saved the pain of either opposing the wishes of a kind but somewhat austere parent, or of applying himself to a profession for the study of which he had no affection, by an unlooked for accident—the arrival of his uncle, Andrew Melville, from the Continent. To him his father committed James, "to be a pledge of his love," and they were destined to be for many years companions in labour and in adversity.

James Melville had left the university with the character of a diligent and accomplished student. He had flattered himself that he had exhausted those subjects which had come under his attention, but he was now to be subjected to a severe mortification. When his uncle examined him he found that he was yet but a mere child in knowledge, and that many years of study were still necessary before he could arrive at the goal which he had supposed himself to have already reached. James' mortification did not, however, lead him to sit down in despair. He renewed his studies with the determination to succeed, and revised, under his uncle's directions, both his classical and philosophical education. "That quarter of yeir," says he, "I thought I gat graitter light in letters nor all my tyme befor. . . . And all this as it wer by cracking and playing, sa that I lernit mikle mair by heiring of him [Andrew Melville] in daylie conversation, bathe that quarter and thereafter, nor euer I lernit of anie buik, whowbeit he set me euer to the best authors."

Endowed with such talents and acquirements, it will readily be believed that Andrew Melville was not allowed to remain long idle. He was soon after his return invited to become principal of the university of Glasgow; an appointment which, after a short trial, he agreed to accept. In October, 1574, he left Baldovny to undertake the duties of his office, taking with him his nephew, who was, in the following year, appointed one of the regents. The labours of Andrew Melville at Glasgow have been already noticed in his life, and we shall therefore only extend our inquiries here to the course adopted by the subject of this memoir. For the first year James Melville taught his class "the Greek grammar, *Isocratis Parænesis ad Demonicum*, the first buik of Homers *Iliads*, *Phocylides*, Hesiods *Εργα και Ημεραι*, the Dialectic of Ramus, the Rhetoric of Taleus, with the practice in Ciceros *Catalinars* and *Paradoxes*." "The second year of my regenting," says James Melville, "I teachit the elements of arithmetic and geometrie, out [of] Psellus for shortnes; the *Offices* of Cicero; Aristotles Logic in Greek and Ethic (and was the first regent that ever did this in Scotland); also Platoes *Phædon* and *Axiochus*; and that profession of the mathematiks, logic, and morall philosophie, I keipit (as everie one of the regents keipit their awin, the schollars ay ascending and passing throw) sa lang as I regented ther, even till I was, with Mr. Andro, transported to St. Andros." His private hours were devoted to the study of the Hebrew language and of theology. He had already upon one occasion given proof of his talents for public teaching, and he had now an opportunity of continuing his labours. It was a custom that each regent should, for a week in turn, conduct the stu-

dents to a church near the college, where the citizens also attended, to hear prayers and one or two chapters of the Scriptures read. The regents had hitherto confined themselves exclusively to these limits, probably from a feeling of their inability to offer any commentary; but James Melville, taking a general view of the passages read, gave them a summary of the doctrines enforced, and accompanied it with an application to the situations of his hearers. "This pleasis and comfortit guid peiple verie mikle."

The routine of academical instruction affords but few materials for biography. James Melville has therefore recorded little relative to himself at this period of his life, except an attack made upon him by one of the students, and the occurrences consequent upon it. But although this affair originated with him, it belongs more properly to the life of Andrew Melville, who, as principal of the college, acted the most prominent part in all the subsequent proceedings.

Andrew Melville had now accomplished nearly all that zeal or talent could effect for the university of Glasgow. Its revenues were improved,—its character as a seat of learning raised much above that of any of the other Scottish universities,—the number of students was greatly increased, and its discipline maintained with a degree of firmness, of the necessity of which, however sceptical modern readers may be, the attack to which we have just alluded is a most decided proof. The assembly which met at Edinburgh therefore ordained that Melville should remove to the new college of St. Andrews, "to begin the wark of theologie ther with sic as he thought meit to tak with him for that effect, conform to the leat reformation of that universitie, and the new college therof, giffen be the kirk and past in parliament." Availing himself of the privilege thus granted of nominating his assistants, he requested his nephew to accompany him. James had for some time resolved upon going to France, but he had too much respect for his uncle to refuse his request. They therefore removed together from Glasgow in the month of November, 1580, leaving Thomas Smeton, "a man of singular gifts of learning and godlines," and Patrick Melville, a young gentleman who had lately finished his philosophical studies, as their successors.

In December they entered upon the duties of their respective professions. After his preface or inaugural discourse, James Melville commenced teaching his students the Hebrew grammar. There were, probably, few young men in the country who, either from their opportunities of acquiring knowledge, or their desire to improve under them, were better qualified to discharge this office well; but his natural diffidence caused him a degree of anxiety which many, less accomplished masters have not experienced. "The grait fear and cear," says he in his *Diary*, "quhilk was in my heart of my inabilitytie to vnder-tak and bear out sa grait a charge as to profess theologie and holie tounges amangis ministers and maisters, namelie [especially] in that maist frequent vniuersitie of St. Andros, amangis diuers alerit and displacit, and therfor malcontents and mislykers, occupied me sa, that I behovit to forget all, and rin to my God and my buik."

During the earlier period of their residence at St. Andrews, Andrew Melville and his nephew had many difficulties to encounter. The former principal and professors annoyed their successors by "pursuit of the compts of the college." The regents of St. Leonards, enraged that the philosophy of their almost deified Aristotle should be impugned, raised a commotion; and, to quote the appropriate allusion of

James Melville, cried out with one voice, "Great is Diana of the Ephesians!" The provost and bailies, with the prior and his gentlemen pensioners, were suspected of corrupt proceedings, especially in the provision of a minister for the town, and the opposition and exposures of Andrew Melville thus raised up for him and his fellow-labourers another host of enemies. These were all open and avowed opponents, but they had one to deal with who, as yet wearing the mask of friendship, was secretly plotting their own and the church's ruin—this person was Archbishop Adamson. Add to all this, that immediately after their settlement at St. Andrews, the carelessness of one of the students had nearly been the cause of setting the establishment on fire, and we shall be abundantly persuaded that it required no small energy of mind, such as Andrew Melville indeed possessed, not only to bear up in such a situation, but successively to baffle all the opposition that was offered to him. But amidst many discouragements which the more sensitive mind of James Melville must have keenly felt, he had also many cheering employments. He was engaged in duties which we have seen had been, from an early period, the objects of his greatest desire—he was the teacher of some promising young men who afterwards became shining lights in the church, and he had the gratification of being requested to occupy the pulpit on many occasions when there was no minister in the town, or when the archbishop happened to be absent.

At the assembly which met at Edinburgh in December, 1582, James Melville was earnestly requested to become minister of Stirling. For himself he felt much inclined to accede to the wishes of the inhabitants, and the more so as he was now on the eve of his marriage; but his uncle considering the affairs of the college still in too precarious a state to admit of his leaving it, refused his consent, and James Melville did not consider it respectful to urge his own wishes. It was indeed fortunate that he was not permitted at this period to leave the college, for in the very next year his uncle was required to appear before the king and privy-council, for certain treasonable speeches alleged to have been uttered in his sermons. When the summons (which ordered him to appear in three days) was served, James Melville was in the shire of Angus, and could not upon so sudden a requisition return to St. Andrews in time to accompany him to Edinburgh. He arrived, however, on the second day of his trial, if indeed the proceedings deserved that name. Passing over the minute circumstances of this transaction, our narrative only requires that we should state that Andrew Melville found it necessary to insure his safety by a flight into England.

In these discouraging circumstances James Melville was obliged to return to St. Andrews to undertake the management of the affairs of the college—with what feelings it may readily be judged. When he considered the magnitude of his charge, and the situation of the church, he was completely overpowered; but the duration of his grief was short in proportion to its violence, and he soon found the truest remedy in applying his whole energies to the performance of his increased duties. He taught divinity from his uncle's chair, besides continuing his labours in the department which properly belonged to him. Nor was this all: the economy of the college, finding himself in the service of a party from whom little advantage or promotion could be expected, gave up his office, and thus did the provision of the daily wants of the institution fall to Melville's lot. In the performance of these duties, so arduous and so varied, he was greatly supported by

the masters of the university, who attended his lectures and gave him many encouragements. But his greatest comfort was derived from the society of the afterwards celebrated Robert Bruce of Kinnaird, who, abandoning his attendance on the courts of law, had, with his father's permission, begun the study of theology at St. Andrews.

Harmless, however, as a person whose attention was thus so completely occupied by his own duties must certainly have been, the government did not long permit James Melville to retain his station. The acts of the parliament 1584, by which the Presbyterian form of church government was overthrown, were proclaimed at the market-cross of Edinburgh, and protested against by Robert Pont and others in behalf of the church. We have already alluded to the malpractices of Archbishop Adamson. About the beginning of May, 1584, Melville had gone to one of the northern counties to collect the revenues of the college. It had perhaps been conjectured by the Episcopal party, to their no small gratification, that finding himself unable to comply conscientiously with the late enactments, he had retired, with some of the other ministers, into England. If so, they must have been grievously disappointed by his return. It was certainly not long till the archbishop abundantly manifested his real dispositions; for, on the Sunday immediately following, Melville was informed that a warrant for his apprehension was already in that prelate's possession, and that he was to proceed immediately to its execution. At the earnest desire of his friends he was prevailed on to remove to Dundee, where he had no sooner arrived than he learned that a search had been made for him in every part of the college, and that an indictment had been prepared against him for holding communication with his uncle, the king's rebel. But his removal to Dundee could serve only a very temporary purpose, for it must very soon have become known, and would then have ceased to be any security for his liberty. After the most anxious consideration, he resolved to accept an offer, made him by one of his cousins, to take him by sea to Berwick. This gentleman, hiring a small-boat under the pretext of conveying some of his wines to one of the coast towns in the neighbourhood, took in Melville in the disguise of a shipwrecked seaman; and after a voyage not less dangerous from the risk of detection than from a violent storm which overtook them, landed him safely at Berwick, where he met his uncle and the other ministers who had been obliged to flee.

The suddenness with which James Melville had been obliged to leave St. Andrews prevented him taking his wife along with him; to have done so would, in fact, have endangered the whole party. But after arriving at Berwick, he immediately sent back his cousin, Alexander Scrymgeour, with a letter, requesting this lady (a daughter of John Dury, minister of Edinburgh) to join him. This she had very soon an opportunity of doing, by placing herself under the care of a servant of the English ambassador, and she accordingly remained with her husband during the short period of his exile. At Berwick they resided for about a month; and there, as in every other place, James Melville's amiable and affectionate dispositions procured him many friends. Among these was the lady of Sir Harry Widdrington, governor of the town, under Lord Hunsdon. In the meantime he was invited by the Earls of Angus and Mar, then at Newcastle, to become their pastor. Being totally ignorant of the characters of these noblemen, and of the cause of their exile, he felt unwilling to connect himself with their party,

and therefore replied to their invitation that he could not comply with it, as he had never qualified himself for performing the ministerial functions; but that, as he had determined upon removing to the south, he should visit them on his way thither. When he arrived at Newcastle he determined upon immediately securing a passage by sea to London; but John Davidson, one of his former masters at St. Andrews, and now minister of Prestonpans, informed him that it was not only his own earnest desire, but that of all their brethren, that he should remain at Newcastle with the exiled lords, whose characters and cause he vindicated. To their wishes Melville therefore acceded.

Soon after his settlement at Newcastle, Davidson, who had only waited his arrival, departed, and left him to discharge the duties alone. Thinking it proper that, before entering on his labours, the order of their religious observances and their discipline should be determined, he drew up "the order and manner of exercise of the word for instruction, and discipline for correction of manners used in the companies of those godly and noble men of Scotland in time of their abode in Englande, for the good cause of God's kirk, thair king, and country," and prefixed to it an exhortatory letter to the noblemen and their followers. This prefatory epistle commences by an acknowledgment that their present calamities were the just chastisements of the Almighty for their lukewarmness in the work of reformation—for permitting the character of their sovereign to be formed by the society of worthless and interested courtiers—for their pursuit of their own aggrandizement rather than the good of their country—and for the violation of justice and connivance at many odious and unnatural crimes. But while *they* had thus rendered themselves the subjects of the divine vengeance, how great had been the crimes of the court! It had followed the examples of Ahaz and Uzzah, in removing the altar of the Lord—it had deprived the masters of their livings, and desolated the schools and universities—it had said to the preachers, "Prophecy no longer to us in the name of the Lord, but speak unto us pleasant things according to our liking,"—it had taken from others the key of knowledge—it entered not in, and those that would enter in, it suffered not: finally, it had threatened the ministers, God's special messengers, with imprisonment and death, and following out its wicked designs, had compelled them to flee to a foreign land. "Can the Lord suffer these things long," Melville continues with great energy, "and be just in executing of his judgments, and pouring out of his plagues upon his cursed enemies? Can the Lord suffer his sanctuary to be defiled, and his own to smart, and be the Father of mercies, God of consolation, and most faithful keeper of his promises? Can the Lord suffer his glory to be given to another? Can he who hath promised to make the enemies of Christ Jesus his footstool suffer them to tread on his head? Nay, nay, right honourable and dear brethren, he has anointed him King on his holy mountain; he has given him all nations for an inheritance; he has put into his hand a sceptre of iron to bruise into powder these earthen vessels. When his wrath shall once begin to kindle but a little, he shall make it notoriously known to all the world, that they only are happy who in humility kiss the Lord Jesus and trust in him." He then concludes by a solemn admonition, that with true repentance—with unfeigned humiliation—with diligent perusal of God's word—and with fervent prayer, meditation, and zeal, they should prosecute the work of God, under the assurance that their labours should not be in vain. He warns them of the diligence of the

enemies of God's church,—exhorts them to equal diligence in a good cause,—and reminds them that the ministers of Christ shall be witnesses against them if they should be found slumbering at their posts. At the request of Archibald, Earl of Angus, Melville also drew up a "list of certain great abuses;" but as it is in many points a recapitulation of the letter just quoted from, no further allusion to it is here necessary.

About a month after the commencement of his ministrations Melville was joined by Mr. Patrick Galloway, who divided the labours with him. His family was now on the increase, and it was considered necessary to remove to Berwick, where he remained as minister of that congregation till the birth of his first child—a son, whom he named Ephraim, in allusion to his fruitfulness in a strange land. Notwithstanding the stratagems of Captain James Stewart, by which Lord Hunsdon was induced to forbid them to assemble in the church, the congregation obtained leave, through the kind offices of Lady Widdrington, to meet in a private house; and Melville mentions that he was never more diligently or more profitably employed than during that winter. But the pleasure which he derived from the success of his ministrations was more than counterbalanced by the conduct of some of his brethren at home. It was about this period that many of the Scottish clergy, led on by the example of John Craig, one of the ministers of Edinburgh, signed a deed, binding themselves to obey the late acts of parliament, as far as "according to the word of God." Melville saw the confusions which the introduction of such an equivocal clause must produce. He accordingly addressed a most affectionate but faithful letter to the subscribing ministers, in which he exhibited, at great length, the sinfulness of their compliance, and the handle which such a compromise must give to the enemies of religion. This letter, as it encouraged the firm, and confirmed the wavering, was proportionally the object of hatred to the court. Two of the students at St. Andrews, being detected copying it for distribution, were compelled to flee; and no means seem to have been omitted to check its circulation, or to weaken the force of its statements.

About the middle of February, 1584–5, the noblemen, finding their present residence too near the borders, determined upon removing farther to the south. James Melville therefore prepared to follow. In the beginning of March he and a few friends embarked for London, where they arrived, after a voyage rendered tedious by contrary winds; and being joined by their companions in exile, were not a little comforted. Soon after his arrival Melville resumed his ministerial labours.

Many circumstances, which it is not necessary to detail here, conspired to render their exile much shorter than their fondest wishes could have anticipated. As soon as the noblemen of their party had accommodated their disputes with the king, the brethren received a letter (dated at Stirling, 6th November, 1585) from their fellow-ministers, urging them to return with all possible expedition. James Melville and Robert Dury, one of his most intimate friends, therefore left London, and after encountering many dangers during the darkness of the nights, arrived at Linlithgow. There he found his brethren under great depression of mind: they had vainly expected from the parliament, then sitting, the abrogation of the obnoxious acts of 1584; and they had a further cause of grief in the conduct of Craig, the leader of the subscribing ministers. After much expectation, and many fruitless attempts to persuade the king of the impropriety of the acts, they were

obliged to dismiss, having previously presented a supplication, earnestly craving that no ultimate decision respecting the church might be adopted without the admission of free discussion.

During the following winter James Melville was occupied partly in the arrangement of his family affairs, but principally in re-establishing order in the university. The plague, which had for some time raged with great violence, was now abated, and the people, regaining their former confidence, had begun to return to their ordinary affairs. Taking advantage of this change, the two Melvilles resolved to resume their labours, and accordingly entered on their respective duties about the middle of March. In the beginning of April the synod of Fife convened, and it was the duty of James Melville, as moderator at the last meeting, to open their proceedings with a sermon. He chose for his text that part of the twelfth chapter of St. Paul's Epistle to the Romans, in which the Christian church is compared to the human body—composed, like it, of many members, the harmonious operation of which is essential to the health of the whole. After showing by reference to Scripture what was the constitution of the true church—refuting the doctrine of “the human and devilish bishopric”—adverting to the purity of the reformed constitution of their church, and proving that the inordinate ambition of a few had been in all ages the destruction of that purity—he turned towards the archbishop, who was sitting with great pomp in the assembly, charged him with the overthrow of the goodly fabric, and exhorted the brethren to cut off so unworthy a member from among them. Notwithstanding the remonstrances and protests of the prelate, the synod immediately took up the case—went on, with an inattention to *all* the forms of decency and *some* of those of justice which their warmest advocates do not pretend to vindicate, and ordered him to be excommunicated by Andrew Hunter, minister of Carnbee. Thus, by the fervour of their zeal, and perhaps goaded on by personal wrongs, did an assembly, composed in the main of worthy men, subject themselves to censure in the case of a man of a character disgraceful to his profession; and whom, had they been content to act with more moderation, nothing but the strong hand of civil power could have screened from their highest censures, while even *it* could not have defended him from deserved infamy. But the informality of the synod's proceedings gave their enemies an unfortunate hold over them, and was the means of baffling their own ends. By the influence of the king the General Assembly, which met soon afterwards, annulled their sentence, and the Melvilles, being summoned before the king, were commanded to confine themselves—Andrew to his native place and James to his college. Thus did matters continue during that summer. James Melville lectured to a numerous audience on the sacred history, illustrating it by reference to geography and chronology. On each alternate day he read lectures on St. Paul's Epistle to Timothy, in the course of which he took many opportunities of attacking the hated order of bishops.

Melville was now to obtain what had all along been the object of his highest wishes—a settlement as minister of a parish. In 1583 the charge of the conjoint parishes of Abercrombie, Pittenweem, Anstruther, and Kilrenny, became vacant by the decease of the incumbent, and thus they continued for several years. When the presbytery of St. Andrews resumed their meetings on the return of the banished ministers, commissioners were appointed to visit these parishes, and to bring them if possible to the unanimous choice of a minister. James Melville,

who had been nominated one of these commissioners, soon gained the affections of the people, inasmuch that they unanimously requested the presbytery to send him among them. That court no less warmly urged his acceptance, and he accordingly removed to his charge in July, 1586.

It may be readily conceived that to perform the duties of four parishes was a task far beyond the moral and physical capabilities of any single individual, more especially after they had so long wanted the benefit of a regular ministry. Their conjunction was the result of the mercenary plans of Morton and his friends, but no man was less actuated by such motives than Melville. No sooner did he become acquainted with the state of these parishes than he determined on their disjunction, at whatever pecuniary loss. When this was effected, he willingly resigned the proportions of stipend in favour of the ministers provided for three of the parishes, while he himself undertook the charge of the fourth (Kilrenny)—he obtained an augmentation of stipend, built a manse, purchased the right to the vicarage and teind fish for the support of himself and his successors, paid the salary of a schoolmaster, and maintained an assistant to perform the duties of the parish, as he was frequently engaged in the public affairs of the church. Such instances of disinterested zeal are indeed rare; but even this was not all. Many years afterwards he printed for the use of his people a catechism which cost 500 merks, of which, in writing his *Diary*, he mentions that he could never regain more than one fifth part. While he was thus anxiously promoting the moral and religious improvement of the parishioners, he was also distinguished by the exemplification of his principles in the ordinary affairs of life. An instance of his generosity occurred soon after his settlement in his new charge. In the beginning of 1588 rumours were spread through the country of the projected invasion by the Spaniards. Some time before the destruction of the Armada was known, Melville was waited on, early in the morning, by one of the bailies of the town, who stated that a ship filled with Spaniards had entered their harbour in distress, and requested his advice as to the line of conduct to be observed. When the day was further advanced, the officers (the principal of whom is styled general of twenty hulks) were permitted to land, and appear before the minister and principal men of the town. They stated that their division of the squadron had been wrecked on the Fair Isle, where they had been detained many weeks under all the miseries of fatigue and hunger; that they had at length procured the ship which lay in the harbour; and now came before them to crave their forbearance towards them. Melville replied that, although they were the supporters of Christ's greatest enemy the pope, and although their expedition had been undertaken with the design of desolating the Protestant kingdoms of England and Scotland, they should know by their conduct that the people of Scotland were professors of a purer religion. Without entering into all the minute facts of the case, it may be enough to say, that the officers and men were all at length received on shore and treated with the greatest humanity. “Bot we thanked God with our heartes that we had sein tham amangs ws in that forme,” is the quaint conclusion of James Melville, alluding to the difference between the objects of the expedition and the success which had attended it.

But however disinterested James Melville's conduct might be, it was not destined to escape the most unjust suspicions. When subscriptions were raised to assist the French Protestants and the inhabitants of Geneva (cir. 1588), he had been appointed col-

lector for Fife, and this appointment was now seized upon by his enemies at court, who surmised that he had given the money thus raised to the Earl of Bothwell to enable him to raise forces. The supposition is so absurd that it seems incredible that any one, arguing merely on probabilities, should believe that money intended for Geneva—the very stronghold of his beloved presbytery—should be given to an outlaw and a Catholic. Luckily Melville was not left to prove his innocence even by the doctrine of probabilities. He had in his hands a discharge for the money granted by those to whom he had paid it over, and it was besides matter of notoriety that he had been the most active agent in the suppression of Bothwell's rebellion. Still, however, his enemies hinted darkly where they durst not make a manly charge, and it was not till 1594, when sent as a commissioner to the king by the assembly on another mission, that he had an opportunity of vindicating himself. He then demanded that any one who could make a charge against him should stand forward and give him an opportunity of vindicating himself before his sovereign. No one appeared. Melville was admitted to a long interview in the king's cabinet; and "thus," says he, "I that came to Stirling the traitor, returned to Edinburgh a great courtier, yea, a cabinet councillor."

At the opening of the General Assembly in 1590 James Melville preached. After the usual exordium, he insisted on the necessity of maintaining the strictest discipline—he recalled to the memory of his audience the history of their country since the Reformation, the original purity of the church, and admonished them of its begun decline—the brethren were warned of the practices of "the belly-god bishops of England," and the people were exhorted to a more zealous support of the ecclesiastical establishment, and to a more liberal communication of temporal things to their ministers—lastly, he recommended a supplication to the king, for a free and full assembly, to be held in the royal presence, for the suppression of Papists and sacrilegious persons. The activity of Melville, and indeed of the ministers generally, against the Catholics, must be considered as one of the least defensible parts of their conduct. We are aware that those who believe religion to be supported by works of man's device will find strong palliations for their actions in their peculiar circumstances; and we do not mean to deny, that when the Popish lords trafficked with foreign powers for the subversion of the civil and religious institutions of the country, the government did right in bringing them to account. They then became clearly guilty of a civil offence, and were justly amenable for it to the secular courts. But when the Catholics were hunted down for the mere profession of their religion—when their attachment to their opinions was considered the mere effect of obstinacy, and thus worthy to be visited with the highest pains—the Protestants reduced themselves to the same inconsistency with which they so justly charged their adversaries. If it be urged in defence, that their religion was in danger, we reply, that the conduct of the Catholics previous to the Reformation was equally defensible on the very same grounds. In both cases was the church of the parties in imminent hazard; and if we defend the attempt of one party to support theirs by the civil power, with what justice can we condemn the other? A remarkable passage occurs in the account which Friar Ogilvie (a Jesuit, who was executed at Glasgow in 1615) has left of his trial. His examiners accused the Kings of France and Spain of exterminating the Protestants. Ogilvie immediately replied: Neither has Francis banished nor Philip burned Protestants on

account of religion, but on account of *heresy*, which is not religion but *rebellion*.¹ Here, then, is the rock upon which both parties split—that of considering it a crime to hold certain religious opinions. Both parties were in turn equally zealous in propagating their ideas—both were justifiable in doing so—and both equally unjustifiable in their absurd attempts to control the workings of the human mind. Truth, which all parties seem convinced is on their side, must and shall prevail, and the intolerant zeal of man can only prove its own folly and its wickedness. We return to the narrative.

When the king, in October, 1594, determined on opposing the Popish lords in person, he was accompanied at his own request by the two Melvilles and two other ministers. Following the Highland system of warfare, these noblemen retired into their fastnesses; and the royal forces, after doing little more than displaying themselves, were ready to disperse for want of pay. In this emergency James Melville was despatched to Edinburgh and the other principal towns, with letters from the king and the ministers, urging a liberal contribution for their assistance. His services on this occasion, and the spirit infused by Andrew Melville into the royal councils, materially contributed to the success of the expedition.

We have mentioned, that at the interview at Stirling, James Melville had regained the favour of the king; but it is probable that that and subsequent exhibitions of the royal confidence were merely intended to gain him, in anticipation of the future designs of the court relative to the church. In the affair of David Black, Melville had used his influence with the Earl of Mar to procure a favourable result; and although the king did not express disapprobation of his conduct—but, on the contrary, commanded him to declare from the pulpit at St. Andrews the amicable termination of their quarrel—he observed that from that period his favour uniformly declined. Finding after two years' trial that his conduct towards James Melville had not induced him to compromise his principles, the king probably considered all further attempts to gain him quite unnecessary.

In May, 1596, the covenant was renewed by the synod of Fife, and in the following July by the presbytery of St. Andrews; on both of which occasions Melville was appointed "the common mouth." After the last meeting the barons and gentlemen resolved that he and the laird of Reiras [Kires?] should be sent to the king, to inform him of the report of another Spanish invasion, and of the return of the Popish lords; but Melville's interest at court was now on the decline, and his mission met with little encouragement. Returning home, he applied himself assiduously to the duties of his parish. He drew up a *Sum of the Doctrine of the Covenant renewed in the Kirk of Scotland*, in the form of question and answer. Upon this the people were catechised during the month of August; and on the first Sunday of September, the covenant was renewed and the sacrament administered in the parish of Kilrenny.

During the next ten years the life of Melville was spent in a course of opposition, as decided as it was fruitless, to the designs of the court for the re-establishment of Episcopacy. While some of his most intimate friends yielded, he remained firm. There was but one point which he could be induced to give up. He was urged by the king (1597) to preach at the admission of Gladstones, the future archbishop,

¹ *Relatio Incarcerationis et Martyrii P. Joannis Ogilbei, &c.*, Duaci, 1615, p. 24. This is, of course, the Roman Catholic account. Ogilvie's trial, and a reprint of the Protestant account of it set forth at the time, will be found in Pitcairn's *Criminal Trials*.

to the church of St. Andrews, from which David Black had been ejected; and he did so, in the hope of benefiting some of his distressed friends by the concession; but it afterwards cost him much uncomfortable reflection. In the month of October he visited, along with others appointed for that purpose, the churches in the counties of Aberdeen, Moray, and Ross. He had entered upon this duty under considerable mental depression and bodily suffering; and it may be supposed to have been but little diminished when he detected, during the journey, the plans of the court for the re-establishment of the Episcopal order. Finding that his labours on behalf of the church had been attended with so little success, he would willingly have retired from public life, and shut out all reflection on so unsatisfactory a retrospect in the performance of his numerous parochial duties; but a sense of what he owed to the church and to his friends in adversity induced him to continue his discouraging labour; and accordingly, till he was ensnared into England, whence he was not allowed to return, he made the most unwearied exertions in behalf of Presbytery. Except the gratification the mind receives from marking the continued struggles of a good man against adversity, the reader could feel little interest in a minute detail of circumstances which, with a few changes of place and date, were often repeated. Vexation of mind and fatigue of body at length brought on an illness, in April, 1601, which lasted about a year; but this did not damp his zeal. When he could not appear among his brethren, and subsequent illness not unfrequently compelled him to be absent, he encouraged or warned them by his letters. Every attempt was made to overcome or to gain him. He was offered emoluments and honours, and when these could not shake his resolution, he was threatened with prosecution; but the latter affected him as little. When he was told that the king hated him more than any man in Scotland, "because he crossed all his turns, and was a ring-leader," he replied in the words of the poet,

"Nec sperans aliquid, nec extimescens,
Exarmaveris impotentis iram."

His conduct on the first anniversary of the Gowrie conspiracy did not tend to mitigate his majesty's wrath. An act of parliament had been passed, ordaining it to be observed as a day of thanksgiving; but as this act had never received the sanction of the church, Melville and others refused to comply with it. They were, therefore, summoned by proclamation to appear before the council, and the king vowed that the offence should be considered capital. They accordingly appeared: but his majesty, finding their determination to vindicate their conduct, moderated his wrath, and dismissed them, after a few words of admonition. The conduct of Melville in relation to the ministers imprisoned for holding the assembly at Aberdeen was not less decided. A short time before their trial the Earl of Dunbar requested a conference, in which he regretted to him the state of affairs, and promised that, if the warded ministers would appease the king by a few concessions, the ambitious courses of the bishops should be checked, and the king and church reconciled. With these proposals Melville proceeded to Blackness, the place of their confinement; but negotiation was too late, for the very next morning they were awakened by a summons to stand their trial at Linlithgow. When they were found guilty of treason, it was considered a good opportunity to try the resolution of their brethren. To prevent all communication with each other, the synods were summoned to meet on one day, when five articles, relative to the powers of the General Assembly and the bishops, were proposed

by the king's commissioners for their assent. On this occasion Melville was confined by illness; but he wrote an animated letter to the synod of Fife, and had the satisfaction of hearing that they and many others refused to comply. This letter was sent by Lord Scone, the commissioner, to the king; but the threat to make it the subject of a prosecution does not appear to have been carried into effect.

The court, backed by the bishops, was now pursuing its intentions with less caution than had formerly been found necessary. An act was passed by the parliament of 1606, recognizing the king as absolute prince, judge, and governor over all persons, estates, and causes, both spiritual and temporal—restoring the bishops to all their ancient honours, privileges, and emoluments, and reviving the different chapters. Andrew Melville had been appointed by his brethren to be present and protest against this and another act in prejudice of the church, passed at the same time; but measures were taken to frustrate his purpose. No sooner did he stand up than an order was given to remove him, which was not effected, however, until he had made his errand known. The protest was drawn up by Patrick Simson, minister of Stirling, and the reasons for it by James Melville. The latter document, with which alone we are concerned, is written in a firm and manly style, and shows in the clearest manner, that, in appointing bishops, the parliament had in reality committed the whole government of the church to the king, the prelates being necessarily dependent upon him.

Some months previous to the meeting of this parliament letters were directed to the two Melvilles, and six other ministers, peremptorily desiring them to proceed to London, before the 15th of September, to confer with the king on such measures as might promote the peace of the church. Although this was the alleged cause for demanding their presence at the English court, there can be little doubt that the real object of the king was to withdraw them from a scene where they were a constant check upon his designs. Their interviews with the king and his prelates have been already noticed in the life of Andrew Melville, and it is only necessary to state here, that, after many attempts, as paltry as they were unsuccessful, to win them over, or to disunite them, and, when both these failed, to lead them into expressions which might afterwards be made the groundwork of a prosecution, Andrew Melville was committed to the Tower of London. At the same time, James was ordered to leave London within six days for Newcastle-upon-Tyne, beyond which he was not to be permitted to go above ten miles, on pain of rebellion. After an unsuccessful attempt to obtain some relaxation of the rigour of his uncle's confinement, he sailed from London on the 2d of July, 1607.¹ The confinement of James Melville at Newcastle was attended by circumstances of a peculiarly painful nature. His wife was at this time in her last illness, but notwithstanding the urgency of the case, he could not be allowed the shortest period of absence; he was therefore compelled to remain in England, with the most perfect knowledge that he must see his nearest earthly relation no more, and without an opportunity of performing the last duties. It was considered a matter of special favour that he was allowed to go to Anstruther for the arrangement of his family affairs after her death; and even this permission was accompanied by peremptory orders, that he should not preach nor attend any meetings, and that he should return to England at the end of a month.

¹ M'Crie's *Melville*, second edition, vol. ii. p. 187. The date attached by Wodrow to Melville's embarkation is June 2, and to his arrival at Newcastle June 10.—*Life of Melville*, p. 132.

The opposition of Melville to Episcopacy continued as steady during his exile as it had been during the time of his ministry. When public disputations were proposed, in the following year, between the ministers who had yielded to the government and those who remained opposed, he disapproved of the plan, and stated his objections at full length in a letter to Mr. John Dykes. He considered such meetings by no means calculated for edification, and he well knew that, were their opponents to be persuaded by argument, abundant opportunities had already been afforded them. When the conferences were appointed to be held at Falkland and other places, he opposed them on the same grounds; but, as the measure had been already determined on, he advised his brethren by letter to take every precaution for the regularity of their proceedings and the safety of their persons. As Melville had anticipated, no good effect was produced; the prelates were now quite independent of arguments for the support of their cause, and felt little inclination to humble themselves so far as to contend with untitled Presbyterians.

Notwithstanding the decided conduct of Melville, several attempts were again made, during his residence at Newcastle, to enlist him in the service of the king. In the month of October immediately following his sentence of banishment, Sir William Anstruther¹ waited on him. He was authorized by the king to say that if Melville would waive his opinions, his majesty would not only receive him into favour, but "advance him beyond any minister in Scotland." Melville replied, that no man was more willing to serve the king in his calling than he, and that his majesty knew very well his affection—what service he had done, and was willing to do in so far as conscience would suffer him; adding that the king found no fault nor ill with him that he knew of, but that he would not be a bishop. "If in my judgment and my conscience," he concluded, after some further remarks, "I thought it would not undo his majesty's monarchy and the church of Christ within the same, and so bring on a fearful judgment, I could as gladly take a bishopric and serve the king therein, as I could keep my breath within me, so far am I from delighting to contradict and oppose to his majesty, as is laid to my charge; for in all things, saving my conscience, his majesty hath found, and shall find, me most prompt to his pleasure and service." With this reply the conversation ended.

During his exile various attempts were made by his parishioners to obtain leave for his return. In February, 1608, the elders of the church of Anstruther prepared a petition with that view, to be presented to the commissioners of the General Assembly; and when through stratagem they were prevented from presenting it, another was given in to the assembly which met at Linlithgow in July, 1609. An application to the king on his behalf was promised; but a reply which he made to a most unprovoked attack on the Presbyterians in a sermon by the vicar of Newcastle, afforded the bishops and their friends a ready excuse for the non-fulfilment of this promise. To preserve appearances, the prelates did indeed transmit to court a representation in favour of the banished ministers; but this is now ascertained to have been nothing more than a piece of the vilest hypocrisy. A private letter was transmitted at the same time discouraging those very representations which in public they advocated, and urging the continuation of their banishment in unabated rigour. Equally unfavourable in their results, although we

have less evidence of insincerity, were the fair promises of the Earl of Dunbar and of Archbishop Spotswood.²

We have already noticed the anxious, though unsuccessful, efforts of Melville in behalf of his uncle. During the whole period of the imprisonment of Andrew Melville his nephew's attentions were continued. He supplied his uncle with money and such other necessities as could be sent him, and received in return the productions of his muse. About this period their correspondence, which they maintained with surprising regularity, took a turn somewhat out of its usual course. James Melville had now been for two years a widower; he had become attached to a lady, the daughter of the vicar of Berwick-upon-Tweed, and he earnestly begged his uncle's advice. The match was considered unequal in point of years, and a long correspondence ensued, from which it became evident that while James' respect for his uncle had led him to request his advice, his feelings had previously become too strongly interested to admit of any doubt as to the decision of the question. Finding his nephew's happiness so deeply concerned in the result, Andrew Melville yielded, and the marriage accordingly took place. Whatever may have been his fears, it is but justice to state that this connection led to no compromise of principle, and that it was attended with the happiest results.

It would seem that the bishops, not content with separating James Melville from his brethren, still thought themselves insecure if he was allowed to remain at Newcastle. They accordingly obtained an order for his removal to Carlisle, which was afterwards changed by the interest of his friends to Berwick. About this period he was again urged by the Earl of Dunbar to accede to the wishes of the king, but with as little success as formerly. That nobleman therefore took him with him to Berwick, where he continued almost to the date of his death. This period of his life seems to have been devoted to a work on the proper execution of which his mind was most anxiously bent—his *Apology for the Church of Scotland*. This work, which however he did not live to see published, bears the title of *Jacobi Melvini libellus Supplex Ecclesie Scoticane Apologeticus*. It was printed at London, and appeared in 1645.

About the year 1612 Melville appears to have petitioned the king for liberty to return to his native country. He received for answer that he need indulge no hopes but by submitting absolutely to the acts of the General Assembly of 1610. Such conditions he would not of course accept, and he considered his return altogether hopeless. But the very measures which the king and the bishops had been pursuing were the means of carrying his wishes into effect. The prelates had lately assumed a degree of hauteur which the nobility could ill have brooked, even had they felt no jealousy of a class of men, who, raised from comparative obscurity, now formed a powerful opposition to the ancient councillors of the throne. They therefore determined to exert their influence for the return of the ministers, and to second the representations of their congregations and friends. In this even the bishops felt themselves

² Another representation in behalf of Melville appears to have been presented to the synod of Fife by his parishioners in 1610. Archbishop Gladstones, the only authority for this statement, writes thus on the subject to the king:—"As for me, I will not advise your majesty anything in this matter, because I know not what is the man's humour as yet, but rather wish that, ere any such man get liberty, our turns took settling a while." "Life of Gladstones," in *Wodrow's Biographical Collections* (printed for the Maitland Club), vol. i. p. 274, 275. So little confidence, does it appear, had the bishops in the stability of their establishment.

¹ Wodrow's *Life of James Melville*, p. 133. This gentleman is named Sir John Anstruther by Dr. McCrie, *Life of Melville*, 2d edit. vol. ii. p. 234.

obliged to join, and they at the same time determined upon a last attempt to obtain from the ministers a partial recognition of their authority, but in this they were unsuccessful. James Melville therefore obtained leave to return to Scotland, but it was now too late. His mind had for some time brooded with unceasing melancholy over the unhappy state of the church, and his health declined at the same time. He had proceeded but a short way in his return home when he was suddenly taken ill, and with difficulty brought back to Berwick. Notwithstanding the prompt administration of medicine, his complaint soon exhibited fatal symptoms; and after lingering a few days, during which he retained the most perfect tranquillity, and expressed the firmest convictions of the justice of the cause in which he suffered, he gently expired, in the fifty-ninth year of his age and eighth of his banishment.

The character of Melville is so fully developed in the transactions of his life, that if the present sketch is in any degree complete, all attempt at its further delineation must be unnecessary. A list of his works will be found in the notes to Dr. M'Crie's *Life of Andrew Melville*. Of these, one is his *Diary*, which has been printed as a contribution to the Bannatyne Club, and which has supplied the materials for the present sketch up to 1601, where it concludes. This *Diary*, combining, as it certainly does, perfect simplicity of style with a thorough knowledge of its principles—containing the most interesting notices of himself and other public men, while it is perfectly free from egotism—and, above all, indicating throughout the best feelings both of a Christian and a gentleman—is one of the most captivating articles in the whole range of autobiographical history.¹ It is no less remarkable than, in our estimation, it is unquestionable, that the most interesting additions to Scottish history, brought to light in our times, are written by persons of the same name. We allude to the *Diary* of James Melville, and the *Memoirs* of Sir James Melville, with which it must not be confounded. There is one point however in Melville's *Diary* which must forcibly strike every one who is acquainted with its author's history—we mean the allusion in many parts of his narrative to whatever evils befell the enemies of the church as special instances of the divine vengeance for their opposition to its measures. Its enemies were undoubtedly highly criminal, but this method of pronouncing judgment upon them cannot be defended upon any ground of Scripture or charity.

But while we condemn this theory in connection with James Melville's name, justice requires the admission that it was by no means a peculiar tenet of his—it was the doctrine of an age rather than of an individual. It is, moreover, let it ever be remembered, to such men as Andrew and James Melville that we owe much of our present liberty; and but for their firmness in the maintenance of those very principles which we are so apt to condemn, we might still have been acting those bloody scenes which have passed away with the reigns of Charles and of James. They struggled for their children—for blessings, in the enjoyment of which they could never hope to participate. And let not us, who have entered into their labours, in our zeal to exhibit our superior enlightenment, forget or underrate our obligations. The days may come when our privileges may be taken away; and how many of those who condemn the zeal and the principles of their forefathers will be found prepared to hazard so much for conscience?

sake, or to exhibit even a small portion of their courage and self-denying patriotism in the attempt to regain them?

MELVILLE, SIR JAMES, a courtier of eminence, and author of the well-known memoirs of his own life and times which bear his name. In that work he has made effectual provision to keep posterity mindful of the events of his life, and the following memoir will chiefly consist of an abridgment of the facts he has himself detailed.² He appears to have been born in the year 1535. His father was Sir John Melville of Raith, one of the early props of the Reformed faith, who, after suffering from the hate of Beaton, fell a victim to his successor, Archbishop Hamilton, in 1549.³ Nor were his children, or his widow, who was a daughter of Sir Alexander Napier of Merchiston, spared from persecution. James, who was the third son, was, by the queen-dowager's influence and direction, sent at the age of fourteen, under the protection of the French ambassador returning to France, to be a page of honour to the young Queen of Scotland. The French ambassador Monluc, Bishop of Valence, besides his embassy to Scotland, had before his return to accomplish a secret mission to the malcontents of Ireland, who had begun to breathe a wish to cast off the yoke of England, and might have proved a very valuable acquisition to France. To Ireland Melville accompanied him. Immediately on his arrival Sir James encountered a love adventure, which he tells with much satisfaction. The ship had been overtaken by a storm, and with difficulty was enabled to land at Lochfeul. They were entertained by O'Docherty, one of the bishop's friends, who lived in "a dark tour," and fed his friends with such "cauld fair" as "herring and biscuits," it being Lent. The bishop was observed to bend his eyes so attentively on O'Docherty's daughter that the prudent father thought it right to provide him with the company of another female, in whose conduct he had less interest or responsibility. This lady was so far accomplished as to be able to speak English, but she produced an awkward scene by her ignorance of etiquette in mistaking a phial "of the only maist precious balm that grew in Egypt, which Soliman the great Turc had given in a present to the said bishop," for something eatable, "because it had an odoriphant smell." "Therefore she licked it clean out." The consequence of the bishop's rage was the discovery of his unpriestly conduct. Meanwhile O'Docherty's young daughter, who had fled from the bishop, was seized with a sudden attachment for Melville. "She came and sought me wherever I was, and brought a priest with her that could speak English, and offered, if I would marry her, to go with me to any part which I pleased." But James was prudent at fourteen. He thanked her, said that he was yet young, that he had no rents, and was bound for France. With the assistance of Wauchope, Archbishop of Armagh (a Scotsman), Monluc proceeded with his mission. From O'Docherty's house they went to the dwelling of the Bishop of Roy. Here they were detained until the arrival of a Highland boat, which was to convey them to Scotland, and after more storms and dangers, losing their rudder, they at length landed in Bute. In the person to whom the boat belonged, Melville found a friend, James M'Connell of Kiltyre, who had experienced acts of kindness from his father. Soon after their return to Scotland Melville sailed with the

¹ "The Autobiography and Diary of James Melville, with a Continuation of the Diary to A.D. 1610," was also published by the Wodrow Society in 1842.

³ Wood's *Peerage*, ii. 112.

ambassador to France, and landed on the coast of Brittany. The bishop, proceeding by post to Paris, left his young protégé to the attendance of "two young Scottis gentlemen," who were instructed to be careful of him on the way, and to provide him with the necessary expenses, which should be afterwards refunded to them. The three young men bought a nag each, and afterwards fell into company with three additional companions, a Frenchman, a Spaniard, and a native of Bretagne—all travelling in the same direction. At the end of their first day's journey from Brest they all took up their night's rest in a chamber containing three beds. The two Frenchmen and the two Scotsmen slept together. Melville was accompanied by the Spaniard. In this situation he discovered himself to be the subject of plot and counterplot. He first heard the Scotsmen—with much simplicity certainly, when it is remembered that a countryman was within hearing—observe, that as the bishop had directed them to purvey for their companion, "therefore we will pay for his ordinaire all the way, and sall compt up twice as meikle to his master when we come to Paris, and so sall won our own expenses."¹ This was a good solid discreet speculation, but it need not have been so plainly expressed. While it was hatching, the Frenchmen in the next bed were contemplating a similar plot, on the security of the ignorance of the French tongue on the part of their companions, and their inexperience of French travelling, proposing simply to pay the tavern bills themselves, and charge a handsome premium "sufficient to pay their expenses" for their trouble. Melville says he could not refrain "laughing in his mind." The Frenchmen he easily managed, but the Scotsmen were obdurate, insisting on their privilege of paying his charges, and he found his only recourse to be a separate enumeration of the charges, and the "louns" never obtained payment of their overcharge. But the Frenchmen were resolved by force to be revenged on the detector of their cunning. In the middle of a wood they procured two bullies to interrupt and attack the travellers, and when Melville and his friends drew, they joined their hired champions. But Melville, by his own account, was never discomfited, and when they saw their "coun-tenance and that they made for defence," they pretended it was mere sport. Melville informs us how, after his arrival at Paris, his friend the bishop was called to Rome, and himself left behind to learn to play upon the lute and to write French. In the month of May, 1553, Melville appears to have disconnected himself from the bishop, of whom he gives some curious notices touching his proficiency in the art magique and mathématique, and came into the service of the Constable of France—an office in the acquisition of which he was much annoyed by the interference of a Captain Ringan Cocburn, "a busy medlar." At this point in his progress the narrator stops to offer up thanks for his good fortune. As a pensioner of France he became attached to the cause of that country in the war with Charles V., and was present at the siege of St. Quentin, where his patron the constable was wounded and taken prisoner, and himself "being evil hurt with a stroke of a mass [mace] upon the head, was mounted again by his servant upon a Scots gelding, that carried him home through the enemies who were all between him and home; and two of them struck at his head with swords, because his head-piece was tane off after the first encounter that the mass had enforced, and the two were standing between him and home, to keep prisoners in a narrow strait;" but Melville's

horse ran between them "against his will," as he candidly tells, and saved his master by clearing a wall, after which he met his friend Harry Killigrew, who held the steed while its master entered a barber's shop to have his wounds dressed. Melville appears to have attended the constable in his captivity, and along with him was present at the conference of Chateau Cambresis, the consequence of which he states to be "that Spayne obtained all their desires: the constable obtained liberty: the Cardinal of Lorraine could not mend himself, no more than the commissioners of England." After the peace the king, at the instigation of the constable, formed the design of sending Melville to Scotland to negotiate its terms with reference to this country, and to check the proceedings of Moray, then prior of St. Andrews, and the rising influence of the Lords of the Congregation. The Cardinal of Lorraine, however, had influence sufficient to procure this office for Monsieur De Buttoncourt, a person whose haughty manner, backed with the designs of the "holy alliance" he represented, served to stir up the flame he was sent to allay; and the more prudent Melville, whose birth and education certainly did not qualify him to conduct such a mission with vigour, or even integrity to his employers, was sent over with instructions moderate to the ear, but strong in their import. A war for mere religion was however deprecated; the constable shrewdly observing, that they had enough to do in ruling the consciences of their own countrymen, and must leave Scotsmen's souls to God. Melville was instructed "to seem only to be there for to visit his friends." He found the queen-regent in the old tower of Falkland, in bitterness of spirit from the frustration of her ambitious designs. Quietly and stealthily the emissary acquired his secret information. The ostensible answer he brought with him to France was that the prior of St. Andrews did *not* aspire to the crown; a matter on which the bearings were probably sufficiently known at the court of France without a mission. Such, however, is the sum of what he narrates as his answer to the constable, who exhibited great grief that the accidental death of Henry, which had intervened, and his own dismissal, prevented a king and prime minister of France from reaping the fruit of Melville's cheering intelligence. Scotsmen becoming at that time unpopular in France, Melville obtained the royal permission to travel through other parts of the Continent. With recommendations from his friend the constable, he visited the court of the elector-palatine, where he was advised to remain and learn the German tongue, and was courteously received. At the death of Francis II. he returned to France as a messenger of condolence for the departed, and congratulation to the successor, from the court of the palatine. He returned to the palatine with "a fair reward, worth a thousand crowns;" whether to the palatine or himself, is not clear. When Melville perceived Queen Mary about to follow the advice of those who recommended her return to Scotland, he called on her with the offer of his "most humble and dutiful service;" and the queen gave him thanks for the opinions she heard of his affection towards her service, and desired him, when he should think fit to leave Germany, to join her service in Scotland. The Cardinal of Lorraine, among his other projects, having discovered the propriety of a marriage betwixt Mary and the Archduke Charles of Austria, brother to Maximilian, Melville was deputed by secretary Maitland to discover what manner of man this Charles might happen to be; to inquire as to his religion, his rents, his qualities, his age, and stature. Melville had a very discreet and confiden-

¹ *Memoirs*, p. 13, partially modernized in orthography.

tial meeting with Maximilian, who made diligent inquiry as to the intentions of the Queen of Scots and her subjects regarding the alleged right to the English throne; while it struck the wily Scot that he was not particularly anxious to advance his brother to a throne, presently that of Scotland, but not unlikely to be that of the island of Britain. To obtain such information as might prove a sure footing for his future steps, he procured his companion, Mons. Zuleger, to drink with the secretaries of Maximilian, and ascertained his suspicions to be well founded. Notwithstanding a cordial invitation to join the court of Maximilian (no other man ever had so many sources of livelihood continually springing up in his path), Melville returned to the palatine. On his way he enjoyed a tour of pleasure, passing to Venice and Rome, and returning through Switzerland to Heidelberg, where the elector held his court. He afterwards revisited Paris on a matrimonial scheme, concocted by the queen-mother betwixt her son and Maximilian's eldest daughter, acting in the high capacity of the bearer of a miniature of the lady. The welcomes of his friend the constable, not on the best of terms with the queen-mother, seem now to have fallen with far less cordiality on the heart of Melville, and he looked with some misliking at that dignitary's taking the opportunity of presenting the picture to appear at court, where "he sat down upon a stool, and held his bonnet upon his head, taking upon him the full authority of his great office, to the queen-mother's great misliking." While at Paris, he received despatches from Moray and secretary Maitland, requesting his immediate return to his native country, to be employed in the service of the queen, a mandate which he obeyed. Meanwhile the palatine and his son, Duke Casimir, showed an ambition for a union of the latter with Elizabeth of England; a measure which Melville found curious grounds for dissuading, in fulfilment of his principle of using such influence as he might command to interfere with the appearance of an heir to the crown of England. But Melville could not refuse the almost professional duty of conveying the young duke's picture to England. He obtained an interview with Elizabeth, who was more attentive to the subject of the marriage of Queen Mary than to her own; expressing disapprobation of a union with the Archduke Charles, and recommending her favourite Dudley. He proceeded to Scotland, and was received by Mary at Perth, on the 5th May, 1564. He was informed that it had been the queen's intention to have employed him in Germany, but she had now chosen for him a mission to England. He is most amiable in his motives for following the young queen. He was loath to lose "the occasions and offers of preferment that was made to him in France and other parts: but the queen was so instant and so well inclined, and showed herself endowed with so many princely virtues, that he thought it would be against good conscience to leave her, requiring so earnestly his help and service;" so that, in short, he "thought her more worthy to be served for little profit, than any other prince in Europe for great commodity." He proceeded to England with ample instructions, the amicable purport of which, either as they were really delivered or as Melville has chosen to record them, is well known to the readers of history. Melville made sundry inquiries at "very dear friends" attending the court of Elizabeth, as to his best method of proceeding with the haughty queen; and having, on due consideration, established in his mind a set of canons for the occasion, stoutly adhered to them, and found the advantage of doing so. He was peculiarly cautious on the subject of

the marriage; he remained to witness the installation of Dudley as Earl of Leicester and Baron of Denbigh, cautiously avoiding any admission of the propriety of countenancing a union betwixt him and the queen, while he bestowed on him as much praise as Elizabeth chose to exact, and consented to join in invectives against the personal appearance of Darnley—his being "lang, lusty, beardless, and lady-faced," &c.—"albeit," continues the narrator, "I had a secret charge to purchase leave for him to pass in Scotland, where his father was already." Melville spent nine days at the court of England, and made excellent use of his time. His memorial of the period contains many most ingenious devices by which he contrived to support the honour of the Queen of Scotland, while he flattered the Queen of England on her superiority. He delighted her much by telling her the Italian dress became her more than any other one, because he saw she preferred it herself—this was no disparagement to his own queen. He said they were both the fairest women in their respective countries; and, being driven to extremities, told Elizabeth he thought her the whiter, but that his own queen was very "luesome;" leaving the inference, when Elizabeth chose to make it, that she was as much more "luesome" as she was whiter, though by no means making so discreditable an admission. It happened fortunately that the Queen of Scotland, being taller than the Queen of England, the latter decided the former to be too tall. Melville, who had no foresight of the more enlarged opinions of posterity, reviews all his petty tricks and successful flatteries with the air of one claiming praise for acts which increase the happiness of the human race. The following paragraph is exemplary to all courtiers. He had been giving moderate praise to the musical abilities of Mary. "That same day after dinner my Lord of Hunsden drew me up to a quiet gallery, that I might hear some music; but he said he durst not avow it, where I might hear the queen play upon the virginals. But after I had hearkened awhile, I took by the tapestry that hung before the door of the chamber, and seeing her back was towards the door, I entered within the chamber, and stood still at the door cheek, and heard her play excellently well; but she left off so soon as she turned about and saw me, and came forward, seeming to strike me with her left hand and to think shame; alleging that she used not to play before men, but when she was solitary her alone, to eschew melancholy; and asked how I came there. I said, as I was walking with my L. of Hunsden, as I passed by the chamber door, I heard such melody that ravished and drew me within the chamber I wist not how; excusing my fault of homeliness, as being brought up in the court of France, and was willing to suffer what kind of punishment would please her lay upon me for my offence." The result was that he acknowledged Elizabeth a better musician than Mary, and she said his French was good. After so much politeness, his opinion of Elizabeth, which he retailed to Mary, was, "there was neither plain dealing, nor upright meaning, but great dissimulation—emulation that her (Mary's) princely qualities should ever soon chase her out and displace her from the kingdom."

The next public duty in which Melville was engaged was as bearer of the intelligence of the birth of the prince, afterwards James VI., to the court of England, for which purpose he left Edinburgh on the 19th June, 1566. He found Elizabeth dancing after supper in a state of jovialty and merriment, which was momentarily quashed on the reception of what she termed the welcome intelligence. But next morning the queen had prepared herself to

receive her complimentary friend, who had excused his homeliness on the ground of his having been brought up in France, and the spirit of their previous conference was renewed; the courtier turning his complimentary allusions into a very hideous picture of the evils of marriage, as experienced by his own queen, that no little bit of endeavour on his part (according to his avowal) might be lost, conducive to settling in the mind of the English queen a solid detestation of matrimony. He takes credit to himself for having given sage and excellent advice to the Scottish queen on the occurrence of her various unfortunate predilections, particularly on her conduct towards Bothwell during the life of Darnley, and happened to be among those attendants of the queen who were so very easily taken prisoners by the aspirant to the crown. After this event he considered it prudent to obtain leave to return home and enjoy his "rents;" but so long as he was able to transact messages and carry pictures, the atmosphere of a court seems to have been to him the breath of life; he appears to have waited in quiet expectation for whatever little transactions might fall to his lot, and, among other occasions, was present at the marriage of the queen to Bothwell, after that nobleman's "fury" against him, before which he had been obliged to flee on account of his advice to the queen, "more honest than wise," had been propitiated. On the formation of the party for crowning the young prince, he was, as far as his book is concerned, still a zealous servant of his fallen mistress. He was chosen commissioner or emissary to the opposite party—a post he declined to accept, until advised to become the instrument of peace by Maitland, Kirkcaldy, and "other secret favourers of the queen." On the same principle of attention to the interests of Mary, he acted as emissary to meet Moray at Berwick, on his approaching Scotland to assume the regency. He was equally accommodating in furthering the introduction of Lennox, and was engaged in his usual employments under Mar and Morton. It would be tedious to follow him in his list of negotiations, anything which is important in them being more nearly concerned with the history of the times than with the subject of our memoir. The character in which he acted is sufficiently exemplified by the details already unfolded; and it would require more labour and discernment than most men command, to determine for what party he really acted, or on what principles of *national* policy he combated. It may be mentioned that he alleges the busy temper of finding fault with the proceedings of the great, with which he so complacently charges himself on divers occasions, to have lost him the countenance of Morton, while with superlative generosity he recommended the laird of Carmichael to avoid a similar course; and the laird, profiting by the advice, forgot that injured man, the giver of it. When King James wished to free himself from the unceremonious authors of the Raid of Ruthven, he requested the counsel and assistance of Melville, who, although he had taken leave of the court and resolved to live "a quiet contemplative life all the rest of his days," graciously assented to the royal petition. He read his majesty a lecture on the conduct of young princes, and assisted in enabling him to attend the convention at St. Andrews; or, according to his own account, was the sole procurer of his liberty. He was appointed a gentleman of the bed-chamber and a member of the privy-council; but Arran, whom he opposed, managed to supplant him, notwithstanding an unmercifully long letter, reminding James of his services and the royal promises, and bestowing much advice, useful for governors.

He was deprived of his offices, and had no more opportunity "to do good." But he was not entirely excluded from the sun of royalty; he was directed to prepare instructions for himself as an ambassador to the court of England, and held a long conference with the king about the state of the nation, full of much sage advice. He was appointed to "entertain" the three Danish ambassadors, whose mission concerning the restoration of the islands of Orkney terminated in the king's marriage with a Danish princess: and when these gentlemen were plunged into a state of considerable rage at their reception, he was found a most useful and pacific mediator. He was appointed the *confidential* head of that embassy proposed to Lord Altry, and afterwards accepted by his nephew the earl-marischal, for bringing over the royal bride; but he had arrived at that period of life when he found it necessary or agreeable to resign lucrative missions. The portion of his memoirs referring to this period introduces a vivid description of the machinations of the witches to impede the wishes of King James, by which a relation of his own was drowned in crossing the Frith of Forth. On the arrival of the queen, Melville was presented to her as her counsellor, and gentleman of her bed-chamber. His last public duty appears to have been that of receiving the presents of the ambassadors at the christening of Prince Henry. He declined following James to his new dominions, but afterwards paid him a visit, and was kindly received at the English court. His latter days appear to have been spent in preparing his memoirs, so often quoted as a model of wisdom for the guidance of his descendants. Two mutilated editions of this curious work were published in English, besides a French translation, before the discovery of the original manuscripts, which had passed through the hands of the Marchmont family, produced the late genuine edition. Sir James died on the 1st November, 1607,¹ in the eighty-second year of his age. In his character there seems little either to respect or admire; but it is to be remembered that he lived in an age when those who were not murderers or national traitors, were of a comparatively high standard of morality.

MELVILLE, VISCOUNT. See DUNDASES OF ARNISTON (RIGHT HONOURABLE HENRY).

MICKLE, WILLIAM JULIUS (originally MEIKLE), the translator of Camoens' *Lusiad*, and an original poet of considerable merit, was one of the sons of the Rev. Alexander Meikle, who in early life was a dissenting clergyman in London, and assistant to Dr. Watt, but finally settled as minister of the parish of Langholm, in Dumfriesshire, where the subject of this memoir was born in 1734. The mother of the poet was Julia Henderson, of a good family in Mid Lothian. The Rev. Mr. Meikle, whose learning is testified by his having been employed in the translation of Bayle's *Dictionary*, was his son's first teacher. The young poet was afterwards, on the death of his father, sent to reside in Edinburgh, with his aunt, the wife of Mr. Myrtle, an eminent brewer; there he attended the high-school for some years. It is said, however, that though his passion for poetry was early displayed, he was by no means attached to literature in general, till the age of thirteen, when Spenser's *Fairy Queen* falling in his way, he became passionately fond of that author, and immediately began to imitate his manner. At sixteen Mickle was called from school to keep the ac-

¹ Wood's *Peerage*, ii. 112. The introduction to the last edition of his works says aged seventy-two. This is inconsistent with his having been fourteen years of age in 1549, when he accompanied Monluc to France.

counts of his aunt, who, having lost her husband, continued to carry on the business. Not long after he was admitted to a share in the brewery, and his prospects were, at the outset of life, extremely agreeable. For reasons, however, which have not been explained, he was unfortunate in trade; and about the year 1763 became bankrupt. Without staying to obtain a settlement with his creditors he proceeded to London, and tried to procure a commission in the marine service, but, the war being just then concluded, failed in his design. Before leaving the Scottish capital he had devoted himself, only too much perhaps, to poetry. At eighteen he had composed two tragedies and half an epic poem, besides some minor and occasional pieces. Being now prompted to try what poetry could do for him, he introduced himself and several of his pieces to the notice of Lord Lyttelton, who, it is understood, conceived a respectable opinion of his abilities, and recommended him to persevere in versification, but yielded him no more substantial proof of favour.

Mickle appears to have been rescued from these painful circumstances by being appointed corrector to the Clarendon press, at Oxford. This was a situation by no means worthy of his abilities; but while not altogether uncongenial to his taste, it had the advantage of leaving him a little leisure for literary pursuits, and thus seemed to secure to him what has always been found of the greatest consequence to friendless men of genius—a fixed routine of duties, and a steady means of livelihood, while a portion of the mental energies are left free for higher objects. Accordingly, from the year 1765 Mickle published a succession of short poems, some of which attracted considerable notice, and made him known to the world of letters. He also ventured into the walk of religious controversy, and wrote pamphlets against Voltaire and Mr. Harewood, besides contributing frequently to the newspaper called the *Whitehall Evening Post*.

In his early youth Mickle had perused Castara's translation of the *Lusiad* of Camoens, and ever since had entertained the design of executing an English version. He now, for the first time, found leisure and encouragement to attempt so laborious a task. The first canto was published as a specimen in 1771, and met with so much approbation as to induce him to abandon his duties at Oxford, and devote himself entirely to this more pleasing occupation. Having retired to a farm-house at Foresthill, he applied himself unremittingly to the labour, subsisting upon the money which he drew from time to time as subscriptions for his work. In 1775 the version was completed; and, that no means might be wanting for obtaining it a favourable reception, he published it with a dedication to a nobleman of high influence, with whom his family had been connected. The work obtained a large measure of public approbation, which it has ever since retained; but its reception with the patron was not what the translator had been led to expect. A copy was bound in a most expensive manner, and sent to that high personage; but, months passing on without any notice even of its receipt, a friend of the poet, in high official situation, called upon his lordship, to learn if possible the cause of his silence. He found that some frivolous literary adversary of Mickle had prejudiced the noble lord against the work, and that the presentation copy was, till that moment, unopened. We have here, perhaps, one of the latest instances of that prostration of genius before the shrine of rank which was formerly supposed to be so indispensable to literary success, but was, in reality, even in the most favourable instances, only

productive of paltry and proximate advantages. The whole system of dedication was an absurdity. Books were in reality written for the public, and to the public did their authors look for that honour which forms the best motive for literary exertion. To profess to devote their works more particularly to some single member of the community was an impertinence to all the rest, that ought never to have been practised; and we might the more readily denounce the above instance of "patrician meanness," as Mickle's first biographer terms it, if we could see any rationality in the author expecting so much more from one individual for his labours than from another.

During the progress of his translation Mickle composed a tragedy, under the title of the *Siege of Mar-seilles*, which was shown to Garrick, and rejected on account of its want of stage effect. It was then revised and altered by Mr. Home, author of the tragedy of *Douglas*; and a proposal was made to the author to bring it forward in the Edinburgh theatre. This idea was afterwards abandoned, and the tragedy remained in abeyance till the conclusion of the *Lusiad*, when the author made another effort to bring it out on the London stage. It was shown to Mr. Harris of Covent Garden, and again rejected. After this repulse Mickle relinquished all expectations of advantage from the theatre, though he permitted the unfortunate play to be shown to Sheridan, from whom he never again received it.

The *Lusiad* was so well received that a second edition was found necessary in 1779. In the same year Mickle published a pamphlet on the India question, which was at one time expected to obtain for him some marks even of royal favour. In May the most fortunate incident in his life took place. His friend Mr. Johnston, formerly governor of South Carolina, was then appointed to the command of the *Romney* man-of-war, and Mickle, being chosen by him as his secretary, went out to sea in his company, in order to partake of whatever good fortune he might encounter during a cruise against the Spaniards. In November he arrived at Lisbon, where he was received with very flattering marks of attention, and stayed six months, during which time he collected many traits of the Portuguese character and customs, with the intention, never fulfilled, of combining them in a book. During his residence in Portugal he wrote his best poem, *Almada Hill*, which was published in 1781. The cruise had been highly successful, and Mickle, being appointed joint agent for the prizes, was sent home to superintend the legal proceedings connected with their condemnation. His own share of the results was very considerable, and, together with the fortune he acquired by his wife, whom he married in June, 1782, at once established his independence. The remainder of his life was spent in literary leisure, at Wheatley, in Oxfordshire, where he died, October 25, 1788, after a short illness, leaving one son. Mickle's poems are not voluminous, and have been eclipsed, like so much of the other verse of the last century, by the infinitely superior productions of the present or immediately by-past age. Many of them, however, show considerable energy of thought; others, great sweetness of versification; and his translation has obtained the rank of a classic. It is not to be overlooked, moreover, that the authorship of one exquisite song in his native dialect, *There's nae Luck about the House*, is ascribed to him, though not upon definite grounds.

MILL, JAMES. This talented writer, who distinguished himself as a historian, philosopher, and political economist, was born in the parish of Logie-

Pert, Forfarshire, on the 6th of April, 1773. Like a great majority of his countrymen who have risen to eminence, he was of humble origin, his father being a small farmer upon the estate of Sir John Stuart, Bart., of Fettercairn. After a course of preliminary education at the grammar-school of Montrose, young James, who was originally destined for the church, was sent, through the patronage of his father's landlord, to the university of Edinburgh, where he underwent the usual course of study prescribed to candidates for the ministry. His progress in general literature, although unnoticed at the time, was afterwards well attested by the character of his various writings. Of all the ancient philosophers, Plato seems chiefly to have attracted his attention—a proof, by the way, that his proficiency in the classical languages was greater than that of the generality of our Scottish students; and the impression produced upon his mind by the works of this most eloquent and persuasive of all the sages of antiquity he often afterwards affectionately remembered.

After the usual course of study, Mr. Mill was licensed as a preacher in the Church of Scotland, and had fair hopes, both from patronage and his attainments, to occupy that most comfortable of situations—the situation of a Scottish country minister. But somehow it happened that even this was insufficient to allure him. It may be that his Platonism, and the peculiarity of some of his ideas both in theology and ethics, may have disinclined him to Calvin's *Institutes*; or he may have felt that his intellectual aptitudes required a different field of action than that of a secluded country minister. In his capacity of tutor to the family of Sir John Stuart he accompanied them to London in 1800; but instead of returning with them to Scotland, he resolved to devote himself to a literary life in the metropolis. London therefore became thenceforth his home, where he betook himself to authorship as a profession, and patiently endured all its precariousness, until his talents had secured for him that honourable and independent position to which he was so well entitled. The first writings of Mr. Mill in this character were such as to obtain admittance in the most distinguished periodicals of the day; and among these, the *Edinburgh Review*, the *British*, the *Eclectic*, and *Monthly Reviews*, may particularly be mentioned. He also edited for some time the *Literary Journal*, and was a frequent contributor to a periodical established by the Quakers called the *Philanthropist*.

All this labour, however, was but means to an end, for at an early period of his career Mr. Mill had devoted himself to the collection of materials for a history of British India; and while his researches for this most difficult but necessary undertaking were continued with unflinching perseverance, his other literary occupations were conducted as the means of present subsistence. It is amidst such pressure that intellectual activity is often best nerved for its greatest and most important task; and of the many distinguished productions by which the literature of every age is most impressed, the common wonder is, that the author, amidst his other avocations, should have found time to accomplish it. The history of British India was commenced in 1806, and published in the winter of 1817–18. At first it appeared in three volumes quarto, and afterwards in five volumes octavo; and the narrative, which is comprised in six books, commences with the first intercourse of our nation with India, and terminates with the conclusion of the Mahratta war in 1805.

Among the literary productions of the present day we have histories of India in abundance, while the labour of writing them, on account of the copious

supply of materials, has become a comparatively easy task. But far different was it when Mill commenced his celebrated work, and opened up the way for his talented successors. At that time nothing could be more vague than the commonly received ideas at home respecting our growing eastern empire, and the nations of which it was composed. Every sultan or rajah was thought to be a Xerxes or Giamshid, and every region was flooded with gold, which only waited the lifting, while an Englishman had nothing to do but to enter and sit down as undisputed possessor, amidst a crowd of worshipping and salaaming natives. To bring down these monarchs to their real dimensions, and these states to their native poverty—to show how starvation and taxes prevailed far more abundantly there than among ourselves—and, above all, to show how our East India Company, notwithstanding its crores and lacs of rupees, was continually hampered upon the beggarly financial question of “ways and means,” with bankruptcy in perspective,—all this was not only a difficult but a most ungracious task for the historian: he was the African magician, who filched from us our Aladdin's lamp by giving us a mere common one in exchange. When he passed from these popular delusions to the authenticated records, in order to construct a veritable history instead of an eastern romance, his materials were the most impracticable that can well be imagined—parliamentary speeches and documents; masses of examinations and trials; pamphlets for and against every form of Indian administration, mixed with political intrigues and warlike campaigns, to which the general current of history could afford no parallel. To wade through this seemingly boundless ocean—to reduce this chaos into form and order—was an attempt at which the most enthusiastic historian might well have paused. And then, too, the usual aids that might have helped to counterbalance such a difficulty were wanting in the case of Mr. Mill. It is true indeed that in England there were scores of adventurers who had spent years in India, and returned enriched with its spoils; but in most cases they knew as little of Hindoo character and the formation of our Indian empire as if they had remained at home: all they could tell was, that they had fought or traded under the banner of British supremacy, and found cent. per cent. accumulating in the enterprise. In the absence of better information than this, some personal knowledge was necessary, especially to the first recorder of our wonderful Anglo-Indian empire; but Mill had never been in India, and was little, if at all, acquainted with the languages of the East. All these obstacles it is necessary to take into account if we would understand the nature of that Herculean task which he undertook and accomplished. Under these difficulties he proposed:—

1. To describe the circumstances in which the intercourse of this nation with India commenced, and the particulars of its early progress, till the era when it could first be regarded as placed on a firm and durable basis.

2. To exhibit as accurate a view as possible of the people with whom our countrymen had then begun to transact; of their character, history, manners, religion, arts, literature, and laws, as well as the physical circumstances of climate, soil, and production in which they were placed.

3. To deduce to the present times a history of the British transactions in relation to India, &c.

The history of British India which Mr. Mill produced under these circumstances, and upon such a plan, in spite of subsequent histories written under more favourable auspices, will ever remain a distinguishing

monument of his high talents, research, and perseverance. Much of course had to be written that militated not only against national prejudices but individual interests; and therefore the work, at its first appearance, encountered no small amount of rancorous criticism. It was also faulty in point of style, being frequently marked by carelessness, and sometimes, though not often, disfigured by obscurity. But the immense body of information he had collected, the skill of its arrangement, and vigorous style in which it was embodied, made these defects of little account. On the one hand, the nature and character of the British proceedings in India, and especially the administrations of Hastings and Lord Wellesley, were given with clearness and dispassionate fairness; while on the other, the account of the condition and character of the Hindoos, and their state of civilization, was illustrated by an amount of learning and depth of investigation such as history has very seldom exhibited. The effects of his labours were soon apparent. Not only was a greater interest excited at home upon Indian affairs, of which the public had hitherto remained in contented ignorance; but more enlarged and practical views in the legislation, government, and political economy of India were suggested to our countrymen there, by whom our eastern empire was extended and consolidated.

While Mill had been thus generously devoting himself for years to a labour from which no adequate return, in the way of profit, could be expected; and while the expenses of a growing family were increasing upon him, his literary by-labours appear never to have yielded him above £300 per annum—a small amount for the support of a respectable household in the British capital, and small compared with what his talents and industry might have procured him had he consented to become a mere trader in literature. But his was a contentedness of mind that could be satisfied with little, as well as a dignity and independence that would not stoop to solicitation for either place or patronage. But he who could not seek was now to be sought. His *History of India* had well shown what he was worth; and the East India Company was not long in discovering that one so well acquainted with their interests could not be dispensed with. Accordingly, soon after the publication of his history (in 1819) he was appointed by the East India court of directors to the second situation in the examiner's office; and on the retirement of Mr. William McCulloch, he was raised to the place of chief examiner. His important duties, for which he was so thoroughly qualified, consisted in preparing the despatches and other state-papers connected with our Indian government, and to correspond with it in the management of the revenue; in fact, he might be considered as chief minister for Indian affairs to that most extensive and powerful of all senates, the East India Company.

Notwithstanding the onerous duties with which he was now invested, Mr. Mill did not throw aside his pen, or confine himself exclusively to his office. He wrote several valuable articles in the *Edinburgh Review* upon "Education" and "Jurisprudence," and was a frequent and distinguished contributor to the *Westminster* and *London Reviews*. Some of the best essays also which appeared in the Supplement of the *Encyclopædia Britannica*, and were afterwards published in a separate form, were of his production, comprising the important subjects of "Government," "Education," "Jurisprudence," "Law of Nations," "Liberty of the Press," "Colonies," and "Prison Discipline." In 1821-2 he published his *Elements of Political Economy*, which professed to be nothing more than a handbook of that science; and in 1829

his *Analysis of the Human Mind*—a work on which he had bestowed long and careful reflection. These productions gave him a high standing both as a metaphysician and political economist, and added no trivial contribution to these growing and improving sciences in which there is still so much to be accomplished.

In this way the years of Mr. Mill were spent in a life of silent and unostentatious but honourable and useful industry; and while he enjoyed the intercourse of such leading minds as Bentham, Brougham, Romilly, Ricardo, and others of a similar stamp, his society was eagerly sought and highly relished by young men preparing for a public career in literature, who were enlightened by his experience, and charmed with his enthusiasm, as well as directed in their subsequent course by his watchful, affectionate superintendence. He thus lived not only in his own writings, which had a powerful influence upon the opinions of the day; but in the minds which he thus trained for the guidance of a succeeding generation. As the political opinions of such a man were of no trivial importance, we may add that he belonged to the Radical party, and adhered to its principles with uncompromising integrity at a time when they were least valued or regarded. It was a natural consequence of that love of Greek literature and philosophy which he retained to the end of his life. His last five years were spent at Kensington, where he died of consumption on the 23d of June, 1836, in the sixty-fourth year of his age, leaving behind him a widow and nine children, of whom five had attained to manhood.

MILL, WALTER. Of this heroic old martyr little is known beyond the noble adherence to religious truth which his death exhibited, and the impulse which it gave to the Reformation in Scotland. As on these accounts, however, he is too important a personage to be overlooked, we have collected and arranged the few fragments which remain of his personal history.

Walter Mill was probably born about the year 1476, but in what part of Scotland is uncertain. It was the darkest hour of Popery in his native country—but also the hour before the dawn. Having studied for the church and taken priest's orders, he was settled in the county of Forfar, where he was for several years a contented teacher of the religion of Rome; but it is probable that the martyrdom of Patrick Hamilton, and the dissemination of Protestant doctrines, compelled him to pause and inquire. In such a case, his growing lukewarmness to the requirements of his church at a period when its dangers were so ominously accumulating, may have roused the suspicion of his ecclesiastical superiors—or, it may be that, desirous of further enlightenment, he spontaneously repaired to the land which at that time was the great centre of religious inquiry. In the country of Luther, and under the instructions of the great teachers of the Reformation, his opinions became so confirmed, that he abandoned Popery, and on returning to Scotland he indicated the change by abandoning the priestly office and taking to himself a wife. But this was not all: desirous to communicate to others those truths which were too valuable to be withheld, he appears to have laboured as an evangelist of the Reformation both by preaching and private intercourse, moving in the meantime from place to place, partly to disseminate its doctrines more widely and partly to escape the pursuit of his persecutors. Such a life confirmed the Scottish prelates in their suspicion that he was a heretic; and after a long watch of his movements, he

was at last apprehended at Dysart, Fifeshire, in the year 1558, by Sir George Strachan and Sir Hugh Turrie, two priests, emissaries of John Hamilton, Bishop of St. Andrews and primate of Scotland, and lodged in safe custody in the castle of St. Andrews. Having thus secured the offender, their best policy was to obtain his recantation; and to obtain this, both promises and threats were held out. If he refused to abandon his pernicious tenets he was menaced with torture and death, while his recantation was to be rewarded with the comfortable portion of a monk for life in the abbey of Dunfermline. But Walter Mill was equally inaccessible to these alternatives, and nothing remained but to bring him to trial and punishment. For them, they must have felt it to be a fatal remedy, as every martyrdom had only spread abroad more widely the doctrines of the Reformation, and brought themselves into deeper hatred and contempt. Why had they disturbed him at all? Had they not better have left him alone? But the first steps had committed them to the whole process, and it was now too late to recede from it.

The trial was accompanied with sufficient pomp and circumstance, as if to make the guilt of the heretic more impressive; but it was thereby only the more regarded as an act of the church, and therefore a proof of its thorough and hopeless corruptedness. There were assembled as judges: the Bishops of St. Andrews, Moray, Brechin, Caithness, and Athens; the abbots of Dunfermline, Lindores, Balmerino, and Cupar; the provost and principal officials of the university, and a number of friars Black and Gray. The meeting was held in the metropolitan church of St. Andrews on the 20th of April, and Walter Mill brought in to undergo his trial. For the purpose of being examined, his appointed place was the pulpit of the church; but the old man was so enfeebled with his load of years, his trials in wandering from place to place, and the sufferings he had undergone since his imprisonment, that he was unable to climb to the bar without support. It was also feared that his voice would be too weak to be heard; but to the confusion of his judges and the joy of the friends of the Reformation, his utterance was in such clear, trumpet-like tones, as rang and re-echoed through the large building. On entering the pulpit he knelt and prayed, but in this act of devotion he was rudely interrupted by Sir Andrew Oliphant, one of the bishop's priests, who exclaimed, "Sir Walter Mill,¹ arise, and answer to the articles, for you hold my lords here over-long." The other, when he had finished his prayer, meekly answered, "We ought to obey God more than men. I serve one more mighty, even the omnipotent Lord; and whereas you call me Sir Walter, my name is Walter and not Sir Walter. I have been too long one of the pope's knights. Now, say what thou hast to say."

Oliphant now proceeded to the articles of accusation, and these with Mill's answers were as follows:—

"What think you of the marriage of priests?"

"I hold it a blessed bond; for Christ himself maintained it, and approved it, and also made it free to all men. But you think it not free to yourselves; you abhor it; and in the meantime you take other men's wives and daughters, and will not keep the bond that God hath made. You vow chastity and break the vow. St. Paul would rather marry than burn, the which I have done; for God never forbade marriage to any man whatever might be his state or degree."

"You say there are not seven sacraments."

"Give me the Lord's supper and baptism, and take you the rest and divide them among you; for if there be seven, why have you rejected one of them, to wit, marriage, and give yourselves to slanderous and ungodly whoredom?"

"You are against the blessed sacrament of the altar, and you assert that the mass is wrong and is idolatry."

"A lord or a king sendeth, and calleth many to a dinner; and when the dinner is in readiness, he causeth to ring a bell, and the men come to the hall, and sit down to be partakers of the dinner; but the lord turning his back upon them, eateth all himself, and mocketh them:—so do ye."

"You deny the sacrament of the altar to be the very body of Christ, really in flesh and blood."

"The scripture of God is not to be taken carnally but spiritually, and standeth in faith only. And as for the mass, it is wrong; for Christ was once offered on the cross for man's trespass, and will never be offered again, for then he ended all sacrifice."

"You deny the office of a bishop."

"I affirm that those whom ye call bishops do no bishop's works, nor use the offices of bishops as Paul commandeth (writing to Timothy); but live after their own sensual pleasure, and take no care of the flock; nor yet regard they the word of God, but desire to be honoured, and called 'my lords.'"

"You spake against pilgrimage, and called it a pilgrimage to whoredom."

"I affirm that, and say, it is not commanded in Scripture; and that there is no greater whoredom in any places than at your pilgrimages, except it be in common brothels."

"You preached secretly and privately in houses, and openly in the fields."

"Yea, man, and on the sea also, sailing in a ship."

"Will you not recant your erroneous opinions? For if you will not, I will pronounce sentence against you."

"I am upon a charge of life and death; I know I must die once, and therefore, as Christ said to Judas, '*Quod facis, fac cito.*' Ye shall know that I will not recant from the truth, for I am corn, I am not chaff: I will not be blown away with the wind, nor burst with the flail, but will abide both."

Such were the principal charges against Walter Mill, to which other and more trivial matters were added, to aggravate his guilt and justify his condemnation. Already, however, he had spoken enough to satisfy the most merciless inquisitors. He had denounced clerical celibacy with severe but honest warmth, and their ears must have tingled at the justice of his words. He had denied the seven sacraments, the real presence in the eucharist, the office of a bishop as then held and exercised, the efficacy of pilgrimages—the principal doctrines into which the popular theology of Scotland had now shrivelled as a preparative for its extinction—and boldly avowed his readiness to die for the testimony he had delivered. Nothing remained but to pass sentence upon him, that he should be delivered to the temporal judge to be burned as a heretic, and this doom was accordingly pronounced by Sir Andrew Oliphant, who had conducted the accusation. But on this occasion the ghostly judges were sadly at fault, for the secular means of the heretic's punishment were found wanting. Patrick Learmont, the provost of St. Andrews and steward of the bishop's regality, to whom the office of temporal judge belonged, refused to have any share in the proceedings; the whole town were indignant and cried out against the sentence; and the bishop's servants could not get

¹ The title of knighthood was at this time bestowed upon the secular priests in Scotland, as also that of Mass or Mess (French, *Messire*), which last was sometimes continued to the parish minister long after the abrogation of Popery.

for money either a cord to bind the culprit to the stake, or a tar-barrel to burn him. At last the necessary apparatus was somehow obtained, and a servant of the bishop who was appointed temporal judge for the occasion, and accompanied by a band of armed men, conducted Walter Mill to the stake.

On being brought to the place of punishment, the venerable martyr did not belie the courage he had shown upon his trial. On the contrary, his boldness appeared so much increased, that the assembled people thought it miraculous, and that it must be a holy cause for which he was so willing to suffer. On Oliphant bidding him go up to the stake, Mill replied, "Nay, but if thou wilt put me up with thy hand, and take part in my death, thou shalt see me pass gladly; for by the law of God I am forbid to lay hand on myself." His desire being complied with, he ascended triumphantly to the stake, uttering the words of the psalmist, *Introibo ad altare Dei*. He then expressed his desire to address the people; but this was angrily refused by those engaged in the execution, who declared that he had spoken too much already, and that the bishops were offended with the delay that had occurred. But the young men present taking part in the question, expressed themselves so fiercely against the prelates and the prohibition, that Mill's desire could not be otherwise than granted; on which, after kneeling and uttering a short prayer, he stood upright upon the coals, and thus addressed the bystanders: "Dear friends, the cause why I suffer this day is not for any crime laid to my charge (albeit I be a miserable sinner before God), but only for defence of the faith of Jesus Christ, set forth in the Old and New Testament to us; for which, as the faithful martyrs have offered themselves gladly before, being assured after the death of their bodies of eternal felicity, so this day I praise God that he hath called me of his mercy among the rest of his servants, to seal up his truth with my life, which, as I have received it of him, so I willingly offer it to his glory. Therefore, as you will escape the eternal death, be no more seduced with the lies of priests, monks, friars, priors, abbots, bishops, and the rest of the set of Antichrist, but depend only upon Jesus Christ and his mercy, that ye may be delivered from condemnation." After this short and simple speech, which was received by his auditory with sorrow and loud lamenting, fire was set to the fuel, while among the flames his voice continued to be heard exclaiming, "Lord, have mercy upon me! pray, people, while there is time!" and thus he expired.

Nothing could more effectually show the infatuation of the Scottish priesthood than subjecting Walter Mill to martyrdom. It was the extinction of one old, worn-out man, who in the course of nature would have passed away in a few months, perhaps in a few days, to the place where the wicked cease from troubling and the weary are at rest. But in their impatience to anticipate such a conclusion, they committed an act of gratuitous cruelty, that consigned them to infamy and their cause to destruction. The Protestant spirit that as yet only lurked in St. Andrews, seemed to kindle and leap up in a blaze from the flame of the old martyr's pile; and in testimony of their abhorrence of his death the townfolks raised a heap of stones, like a cairn, upon the place of his execution. This was a monument most displeasing to the bishop and his coadjutors, who removed the stones, and threatened with excommunication any who should replace them; but as fast as it disappeared it was renewed, so that no remedy remained for the priests and Papists but to carry away the materials in the night, and use them for building. But these were trivial indications compared with

those that followed. On entering St. Andrews in the ensuing year, John Knox was welcomed by its citizens as a veritable national reformer; and in the destructive but necessary storm with which his career was accompanied—the demolition of monasteries and the purification of churches—the images of the great church of the abbey of St. Andrews, which surpassed those of other churches both in number and costliness, were swept from their shrines, and destroyed by fire on the spot where Mill had suffered. The death of Walter Mill also was the last destructive effort of Popery, as no one afterwards was executed in Scotland for holding the principles of the Reformation.

MILLAR, JOHN, professor of law in the university of Glasgow, and author of the *Historical View of the English Government*, was born on the 22d of June, 1735, in the parish of Shotts, of which his father, the Rev. Mr. James Millar, was minister. Two years after his birth, his father was translated to Hamilton, and he was himself placed under the charge of his uncle, Mr. John Millar of Milhaugh, in the neighbouring parish of Blantyre, where he spent almost all his early years. Having been taught to read by his uncle, he was placed in 1742 at the school of Hamilton, in order to be instructed in Latin and Greek. In 1746, being designed for the church, he went to Glasgow College, where he distinguished himself as an attentive and intelligent student. He had the advantage of the society of Dr. Cullen (then professor of chemistry at Glasgow), to whose wife he was related, and of the acquaintance of other persons distinguished by their intelligence. He was particularly fortunate in obtaining the friendship of Dr. Adam Smith, whose lectures and conversation first directed his attention to the particular line of research in which he afterwards became so eminent. As his mind expanded he found that the clerical profession was not agreeable to his tastes or faculties, and he accordingly adopted the resolution of studying for the Scottish bar. About the time when his college studies were finished he became preceptor to the eldest son of Lord Kames, in whose society he spent two years, during which he formed an intimacy with David Hume and other eminent persons. "It seldom happens," says the *Edinburgh Review*, "that we can trace the genealogy of a literary progeny so correctly as the two circumstances which have now been mentioned enable us to do that of Mr. Millar's future studies. It is perfectly evident to all who are acquainted with their writings, that his speculations are all formed upon the model of those of Lord Kames and Dr. Smith; and that his merit consists almost entirely in the accuracy with which he surveyed, and the sagacity with which he pursued, the path which they had the merit of discovering. It was one great object of those original authors to trace back the history of society to its most simple and universal elements; to resolve almost all that has been ascribed to positive institution to the spontaneous and irresistible development of certain obvious principles; and to show with how little contrivance or political wisdom the most complicated and apparently artificial schemes of policy might have been erected. This is very nearly the precise definition of what Mr. Millar aimed at accomplishing in his lectures and his publications; and when we find that he attended the lectures of Dr. Smith, and lived in the family of Lord Kames, we cannot hesitate to ascribe the bent of his genius, and the peculiar tenor of his speculations, to the impressions he must have received from those early occurrences."

Mr. Millar was called to the bar in 1760, and was soon looked upon as one of the individuals likely to rise to eminence in his profession; but having married at this early stage of his career, and finding it improbable that his labours at the bar would for some years be adequate to his support, he was tempted by an opportune vacancy in the chair of civil law in Glasgow College, to apply for that comparatively obscure situation. Having been successful in his object (1761), he applied himself with all the ardour of an uncommonly active and sanguine temperament to the improvement of the class. Here- tofore the professorship of civil law at Glasgow had been in a great measure useless to the community. The students were seldom more than four in number, and sometimes even less. The late professor, however, had broken through the established usage of lecturing in Latin, and Mr. Millar not only persevered in the same popular course, but adopted other means calculated to attract a larger audience. Instead of writing his lectures—a practice which generally induces the professor to adhere to one train of ideas, and resist the introduction of all progressive improvements—he delivered them extempore, and thus not only took a prompt advantage of every new view that arose in the progress of his science, but enabled himself to introduce familiar and lively illustrations, which were calculated to excite and keep alive the attention of his students to an uncommon degree. Discarding the old academical pomp, he reduced himself to a level with his hearers; he talked to them, and carefully observed that they understood all that he said, and acceded to all his propositions. “His manner,” says the *Edinburgh Review*,¹ “was familiar and animated, approaching more nearly to gaiety than enthusiasm; and the facts which he had to state, or the elementary positions he had to lay down, were given in the simple, clear, and unembarrassed diction, in which a well-bred man would tell a story or deliver an opinion in society. All objections that occurred were stated in a forcible, clear, and lively manner; and the answers, which were often thrown into a kind of dramatic form, were delivered with all the simplicity, vivacity, and easy phraseology of good conversation. His illustrations were always familiar, and often amusing; and while nothing could be more forcible or conclusive than the reasonings which he employed, the tone and style in which they were delivered gave them an easy and attractive air, and imparted to a profound and learned discussion the charms of an animated and interesting conversation. No individual, indeed, ever did more to break down the old and unfortunate distinction between the wisdom of the academician and the wisdom of the man of the world: and as most of the topics which fell under his discussion were of a kind that did not lose their interest beyond the walls of a college, so the views which he took of them, and the language in which they were conveyed, were completely adapted to the actual condition of society; and prepared those to whom they had been made familiar, to maintain and express them with precision, without running the least risk of an imputation of pedantry or ignorance.

“It will be admitted to have required no ordinary share of intrepidity and confidence in the substantial merits of his instructions, to have enabled a professor thus to lay aside the shield of academical stateliness, and not only expose his thoughts in the undress of extemporaneous expression, but to exhibit them, without any of the advantages of imposing or autho-

ritative pretences, on the fair level of equal discussion, and with no other recommendations but those of superior expediency or reason.” He carried his system, however, even to a more hazardous extreme: at the conclusion of every lecture he invited his students to gather around him, and in easy conversation to discuss the principles he had been expounding. It has been justly remarked, that no teacher who did not possess an unusually minute and extensive knowledge of his subject could have ventured upon such a practice; which, however, in his case, was attended with the best effects upon his pupils. Such altogether was the success which attended his prelections, that the class was speedily increased to about forty, and the professor in the Edinburgh College, after seeing his students proportionally diminished, was obliged to abandon the practice of lecturing in Latin, in which he had persevered till Mr. Millar’s reputation as an effective lecturer was completely established.

During the whole time of his connection with Glasgow College, Mr. Millar was a zealous and active member of the Literary Society, a club chiefly formed of the professors, and whose practice it was to meet weekly, and after hearing an essay read by some member in rotation, to discuss the views which it advanced. The tenor of Mr. Millar’s life was little marked by events. He spent his time between the college and a small farm called Whitemoss (near Kilbride), which he took great pleasure in improving. Excepting, indeed, two visits to the metropolis, in 1774 and 1792, and the publication of his two books, there is hardly any incident to which we find our notice particularly called.

Amongst his lectures on jurisprudence, those which referred to the subject of government were remarked to possess an unusual interest. In these he delivered a theoretical history of the progress of society, through the various stages of savage, pastoral, agricultural, and commercial life; with a view of the institutions and changes which would naturally be suggested in their political and domestic habits by their successive transformation; illustrating his remarks by an historical review of all the ancient governments, and more particularly by that of Great Britain. The interest which he found they excited, induced him, in 1771, to publish a short treatise on the subject, which was favourably received. Even to cursory readers it was calculated to afford amusement by the various views of human nature which it exhibited, and by the singularity of many of the traits of manners, as well as of national characters and institutions, which it traced to their sources. Some years afterwards Mr. Millar was induced, by the prevalence of what he conceived to be erroneous ideas respecting the origin of the English government, to expand his views on that subject with a view to publication. After a careful preparation, he published in 1787, his *Historical View of the English Government, from the Settlement of the Saxons in Britain to the Accession of the House of Stewart*. By subsequent labour Mr. Millar intended to bring down the history to his own time, but he only completed it to the Revolution; and a new and posthumous edition in 1803, in four volumes 8vo, comprised that period. As a writer Mr. Millar retained little of that vivacity and fertility of illustration which gave such a charm to his extemporaneous lectures. The style of his compositions is nevertheless forcible and distinct. His *Historical View*, containing much inquiry into the remote periods of our government, and many distinctions which it requires some effort of attention fully to understand, could not be of a very popular nature; but it has been justly appreciated by those who were fitted by

¹ The article we are now quoting was probably the composition of Mr. Jeffrey, who, if we are not mistaken, was a pupil of Mr. Millar.

their habits and previous studies to take an interest in such researches; and, considering the nature of the subjects of which it treats, its having gone through three editions is no slight proof of public approbation.

"The distinguishing feature of Mr. Millar's intellect," says the *Edinburgh Review*, "was the great clearness and accuracy of his apprehension, and the singular sagacity with which he seized upon the true statement of a question, and disentangled the point in dispute from the mass of sophisticated argument in which it was frequently involved. His great delight was to simplify an intricate question, and to reduce a perplexed and elaborate system of argument to a few plain problems of common sense. . . . To form a sound judgment upon all points of substantial importance appeared to him to require little more than the free and independent use of that vulgar sense on which no man is entitled to value himself; and he was apt to look with sufficient contempt upon the elaborate and ingenious errors into which philosophers are so apt to reason themselves. To bring down the dignity of such false science, and to expose the emptiness of ostentations and pedantic reasoners, was therefore one of his favourite employments. He had, indeed, no prejudices of veneration in his nature; his respect was reserved for those who had either made discoveries of practical ability, or combined into a system the scattered truths of speculation." For the remainder of a very elaborate estimate of the genius of Professor Millar, we must refer those who take an unusual interest in the subject to the *Review* itself.¹ We may only mention, what every one will have anticipated from the preceding extract, that Mr. Millar was of Whig politics, bordering on republicanism, and that his sentiments had considerable influence with his pupils, some of whom, as Lord Jeffrey, Lord Chief-commissioner Adam, of the jury court, and the Earl of Lauderdale, were distinguished on that side of the great political question which so long divided public opinion in this country.

In his private character Mr. Millar was extremely amiable. His conversation was cheerful, unaffected, and uncommonly agreeable. His countenance was very animated and expressive; his stature about the middle size; his person strong, active, and athletic, rather than elegant. Though devoted chiefly to metaphysical inquiries, he was extensively acquainted with the natural sciences, with history, with the belles-lettres, and indeed almost all branches of human learning. He retained good health till the end of the year 1790, when he was seized with a very dangerous inflammatory complaint, from which he recovered to a certain extent; but a year and a half after, having exposed himself to cold, he was seized with pleurisy, by which he was carried off, May 30, 1801. Professor Millar left four sons and six daughters. A full memoir of his life was written by his nephew, Mr. John Craig, and prefixed to a fourth edition of his *Origin of the Distinction of Ranks*, published in 1808.

MILLER, HUGH. This was one of those self-educated men who, without the advantages of birth, fortune, or opportunities, and solely by the force of his own talents and perseverance, attained a distinction in the walks of science and literature which placed him among the most eminent of his day. Hugh Miller was born in the obscure town of Cromarty, somewhere in the year 1802. For many generations his progenitors had been seafaring men, and

one of them—John Feddes, his great-grandfather—as yet the most distinguished of the line so far as his descendant could ascertain, had been a buccanier on the Spanish main. The father of Hugh Miller was master of a sloop that traded from Cromarty, and was reckoned the best sailor who ever sailed the Moray Frith. But it was there also that he was to perish with his vessel 'by shipwreck in 1807. Thus the son was left fatherless when only five years old, and unable to realize the calamity, he was wont day after day, from a hillock behind his mother's house that commanded a view of the coast, to watch for the return of his father's vessel. It was fortunate that he had two uncles, the one a working harness-maker, and the other a retired sailor of the navy, both of them intelligent, hard-headed, and warm-hearted men, whose conversation, suited to his capacity, was of itself one of the best of intellectual trainings. In other respects his education had been as unpromising as that of the ordinary run of children. Before his father died he had been sent to a private school kept by a dame, who appears to have received pupils chiefly to keep them out of harm's way—and from a sense of duty, and under the guidance of her instructions and *tawse*, he learned the alphabet, and contrived to struggle through the Shorter Catechism, the Proverbs of Solomon, and the New Testament, and at last to reach the Bible class, which was the highest of all. The difficulty which impeded his progress in learning to read even already indicated his intellectual superiority: he could not tolerate this mechanical process of cramming without learning its use, and knowing whither it tended; while such utilitarian questions an ordinary country schoolmaster of the day was either unable clearly to answer, or to resent as rebellion. No sooner, however, did Hugh discover for himself that the alphabet was the key to printed stories, than his unwillingness fled, and he soon became a fluent reader. He dashed into the literature of boys with more than boyish enthusiasm, and went on in a pursuit of knowledge that was independent of schools and colleges. After he had been twelve months under his preceptor he was transferred to the parish school of Cromarty, and in due time introduced to the study of Latin; but the *Rudiments* appeared to him the dullest and most meaningless of all books, and in Latin itself he could see no such stories as were to be found in the English tongue. His progress was not improved by his removal to a subscription school; the frequent change of teachers which it underwent afforded our young pupil ample leisure to wander along the coast of Cromarty and explore its caves; and in this natural school of scientific knowledge, the lessons of which he was so well fitted to appreciate, he mastered the principles of natural history, and was inspired with the power of poetical description. It was evident that parish schools and subscription schools, however useful for others, were not suited to him, and his connection with all such institutions was abruptly terminated. In the dame's seminary he had been taught to read in the old Scottish fashion, but the fourth teacher who succeeded to the subscription school would make Hugh Miller pronounce the letters and divide the syllables according to the most approved style of modern English reading. At length, for his refusal to divide a word of two syllables, which Hugh deemed a cruel and unnatural dismemberment, the presiding Solomon once and again struck him across the ears with his tawse. This was more than the descendant of the buccanier could brook, and a regular fight between the pair was the consequence, at the close of which he took

¹ Vol. iii. p. 138.

down his cap from the pin, and left the school for ever.

The future occupation of Hugh Miller was now the question, and this he decided by resolving to become a stone-mason. His uncles were both astonished and grieved at his choice. His previous education they had regarded as a preparation for something higher; and although their own means were nothing better than those of common workmen, they offered to assist him at college, until he had qualified himself for one of the learned professions. But he felt in himself no particular vocation either for law or medicine, and was too conscientious to adopt the office of the ministry without a call to the sacred work. Nor had his adoption of such a lowly and laborious calling as that of a mason been without a view to his future studies; for by quarrying among stones he could best pursue his researches in geology, while during the long winter holidays in which his work must be laid aside he could devote himself to the perusal of the best English authors. Having persuaded his uncles to accede to his views, he at the age of seventeen bound himself apprentice to a mason for three years; and as in the country the work of a quarryman was combined with that of a mason, his first employment was in the quarries. It was there that the toil of excavation was to him the opening of a sealed book, in which the secrets of natural science were revealed; and having already studied its alphabet, he was able to read the writing which to others presented only a confused mass of lines. That quarry was an upper bed of the lower old red sandstone, and among its ancient strata he soon detected the same phenomena he had witnessed on the sea-beach when it was laid bare by the ebb-tides. Thus was his lowly occupation already rewarding him—that serf-like doom from which so many shrink abhorrent; and thus justly he could afterwards exclaim of it, “Noble, upright, self-relying toil! who that knows thy solid worth and value would be ashamed of thy hard hands, and thy soiled vestments, and thy obscure tasks—thy humble cottage, and hard couch, and homely fare! Save for thee and thy lessons, man in society would everywhere sink into a sad compound of the fiend and the wild beast; and this fallen world would be as certainly a moral as a natural wilderness.”

Bravely, however, as the young quarryman confronted his daily toil, and richly as his devotedness was rewarded, he found certain penalties attached to his obedience that might have driven the less courageous from the field. So much bodily labour combined with such earnest study was too much for a slim, loosely-knit young lad only seventeen years old, and under such a double avocation it was no wonder that he was often exhausted by weariness and pain. A more formidable symptom was the effect produced upon his mind, so that under these visitations he was subject to such fits of absence that he sometimes walked about or worked like a somnambulist. In these moods he plied his tools so unconsciously, that during the first few months of his apprenticeship he lost seven of his finger-nails by the blows of his mallet. And then also temptation came in the form most congenial to the overwrought and dispirited labourer: he began to regard the contents of the dram-shop as the most effectual of all remedies, and found that his bewilderment could be dissipated and his spirits cheered by the influence of usquebaugh. It was a fearful precipice on which he stood, but where he also was arrested before it was too late. He had joined his companions in drinking a “royal founding pint,” but felt on returning home, and opening the pages of a fa-

vourite author, that the letters danced before his eyes, and that he could no longer master the sense. Warned of his danger and disgusted at the cause, he resolved never more to debase his intellect by such a contemptible indulgence, and this resolution he kept to the end of his life.

On finishing his apprenticeship, the work of a mason having fallen into little demand in his own district, Hugh Miller went to Edinburgh in quest of occupation. He had just attained his majority and won the character of a superior workman, so that he easily found an engagement at Niddry. But his superior intelligence and acquisitions were no sooner discovered by his fellow-labourers, than the recognition was followed with suspicion and envy. He was therefore obliged to live among them “a man forbid,” and console himself for the want of their society with his own thoughts. His visits also to Edinburgh were frequent, and although he had no acquaintance with any of its distinguished literati except Dr. McCrie, his silent observations of the metropolis and its society was a fresh volume of knowledge such as he had not been able to find at Cromarty. After working two years at Niddry, the disease of stone-masons, occasioned by the involuntary inhalation of fine gritty dust while chipping the stones, and under which, notwithstanding their active out-of-door work, they are proverbially a short-lived class, began to attack Hugh Miller, so that a temporary relaxation was necessary, for which purpose he returned to his native town; but several months elapsed before he fully recovered. He then began to execute sculptured tablets and tombstones in Cromarty and its neighbourhood, a task for which his skill as a workman and perceptions of the beautiful admirably qualified him; but the sphere of occupation was too limited to make such employment either profitable or permanent. He therefore removed to the more important town of Inverness, where his skill as a stone-cutter was speedily recognized, and he soon found ample employment. But already his ambition aimed at something higher than being a first-rate carver of tablets. He would also be an author—and as is frequently the case, his first attempt was to be in poetry. He had brought with him to Inverness a bundle of poetical manuscripts, and endeavoured to obtain admission for some of them in a local newspaper; but their rejection by the editor so wrought upon his pride that he resolved to prove himself a veritable poet by letting the whole world read and judge. He accordingly issued from the press *Poems by a Journeyman Stone-mason*, and then sat down to await the verdict. But that at the best was little better than a “Not proven.” Some in the stereotyped phraseology of newspaper criticism dismissed him as “a young man of genius,” while others advised him to throw aside the pen and stick to his chisel. By this experiment he had not discovered where his real strength lay, and all that he had sung in verse he could better have said in prose. This publication, however, was not wholly useless, for it brought him into contact with the talented editor of the *Inverness Courier*, the result of which was a series of papers which Miller contributed to that journal. The subject was sufficiently unambitious, for it was the herring-fishery, but never upon such a humble theme was the true spirit of poetical description so embodied in prose as upon this occasion: it threw its alluring sunshine alike over the occupation and its objects, that made the readers marvel how so much could be said upon such an unpromising subject as catching herrings. The papers were reprinted from the *Inverness Courier*, and it was now acknowledged that their author had the true

spirit of the poet within him. "The Cromarty poet" became the title with which he was recognized by strangers, and in the humble streets of Inverness he was regarded as a great literary celebrity. Acquaintances who were willing to waive all distinctions of rank in behalf of so talented a stone-mason, drew towards him, the chief of whom were Sir Thomas Dick Lauder, and Dr. Baird, principal of the university of Edinburgh. But the best and most influential of all these arrivals was that of a young lady, not only of considerable talents but also of personal attractions, and this acquaintanceship, commenced in literary and scientific pursuits, quickly ripened into the most sentimental of all attachments, so that Miss Lydia Fraser, as soon as her admirer was in a position to marry, became Mrs. Miller.

Soon after the publication of his volume of poems, a branch of the Commercial Bank was opened in Cromarty, and the office of its accountant being offered to him by the agent, he after some hesitation accepted it. The transition from stone-mason to banker was, however, so abrupt, that it could not be made in a day; and to learn the necessary duties of the office he spent two months in one of the branches of the Commercial Bank at Linlithgow. Having learned the preliminary lessons of his new profession, he returned to Cromarty, and became accountant to its bank. During his first year of office he published his *Scenes and Legends of the North of Scotland*. In the following year he married Miss Lydia Fraser. Finding in consequence of this union that his salary of £100 per annum was not so sufficient as he once thought it, he now began to write at his leisure hours for the periodicals to eke out his scanty income, his first attempt in this way being contributions to *Wilson's Tales of the Borders*, which were reckoned the best of the collection. Finding that this serial yielded scanty remuneration, he next offered his services to *Chambers's Journal*, in which he was employed two years upon more liberal terms. Besides these literary occupations, he entered into the squabbles of local and civic politics, especially in defence of his minister, the Rev. Mr. Stewart, and having written some sharp squibs he was rebuked, but very gently, by the authorities of the Commercial Bank, for having compromised their establishment by becoming a political partisan. On account of holding the respectable position of banker, it was natural that Hugh Miller should be elected a member of the town-council of Cromarty; but this distinction he seems to have estimated at its real worth and no more. At one of the meetings of council which he attended, the only serious business was the clubbing of the members to pay a penny each to defray a ninepenny postage, in consequence of the utter destitution of the town-funds.

After having been fifteen years a stone-mason, and about six years a bank-accountant, his talents were to remove him into a higher and more congenial sphere. The non-intrusion question was in agitation, which finally ended in what is termed the Disruption, that rent the national church in twain, and to few the controversy could have greater interest than to Hugh Miller. His knowledge of the ecclesiastical principles and history of the Church of Scotland was greater than that of most men, and his convictions were wholly on the side of the non-intrusionists. Anxiously therefore did he watch every step of the struggle, first in the Court of Session, and afterwards in the imperial parliament. At last, when the decision was given in the House of Lords, Hugh Miller felt that it was time for him to be up and doing; and after a night of sleepless anxiety he composed his memorable pamphlet entitled *A Letter*

from one of the Scotch People to the Right Hon. Lord Brougham. Its conclusive arguments, addressed in that rich and vigorous style of language of which he was now showing himself so complete a master, astonished the leading statesmen of the day, and even compelled the unconvinced to express their admiration. Another pamphlet upon the same topic, and addressed to the public at large, followed, entitled *The Whiggism of the Old School*. His controversial ardour, hitherto so little gratified, had found its proper field; he wrote with all his heart, and therefore with all his might; and men wondered what new and formidable champion had entered so unexpectedly into the field. These tracts were to influence not only the tide of conflict, but of his own fortunes also. The leaders of the non-intrusion party had long seen the necessity of having an organ of their own, in which their cause should be rightly stated and its demands vindicated; but although there was money enough and zeal enough to establish such a newspaper, the difficulty was to find an editor competent for the work. But the appearance of Hugh Miller's pamphlets at once solved the difficulty, and on reading even the first of them, the exclamation followed, "Here is an editor for our *Witness*!" A letter from the chief non-intrusionists was sent to Cromarty, inviting the bank-clerk to meet them in Edinburgh, with which Miller complied, and in the manse of Libberton he accepted the offered editorship, and made arrangements for commencing its duties. Thus he who shrank from the responsibilities of the clerical office, became the constituted advocate and champion of the church in the hour of its difficulty and trial; and there he soon showed himself to be the right man in the right place. His literary and scientific attainments were certain to command respect and procure for him a favourable hearing. His acquaintance with the whole subject at issue was so complete that he could scarcely be taken at unawares. His whole heart was so enlisted in the cause, that those tasks which would have been a very weariness to the hireling journalist, were to him only labours of love, and the charm of his daily life. And what though his adversaries were numerous and strong, and their attacks both fierce and incessant? To him this was only the joy of strife, in which he could return every blow with interest, and hold his own against every comer. Thus equipped at all points, Hugh Miller, on the 15th of January, 1840, commenced his editorial duties, by issuing the first number of the *Witness* newspaper.

Of this remarkable bi-weekly paper we are not called to give the history. It is enough to say that while the petitions of the non-intrusionists to parliament up to the year 1839 bore not more than from 4000 to 5000 signatures from the city of Edinburgh, in 1840, the first year of the *Witness*, they had risen to 13,000 signatures, or more than double their former amount. While the journal was thus successfully discharging its commission, and recommending the subject of non-intrusion to popular interest, it did not confine itself exclusively to ecclesiastical subjects, or sink into that despicable dull thing called a religious newspaper. On the contrary, its many-sided editor dealt largely in articles of criticism, where the subjects of science, literature, and the fine arts were amply discussed, each of them also manifesting a master hand. It was in this way too that he gave in the form of leading articles those imperishable works which he afterwards republished in collected volumes. The earliest of these were his series of papers on the "Old Red Sandstone," which appeared in the *Witness* during the first year of its existence, roused the attention of the scientific world,

and afterwards in a separate form obtained a world-wide reputation. His subsequent publications, the *First Impressions of England and its People*, *Foot-prints of the Creator*, in answer to the *Vestiges of Creation*, and *My Schools and Schoolmasters*, a delightful autobiography of his intellectual training and life, are too well known to require further notice.

As the conflict preceding the Disruption continued to deepen in intensity, the editorial toils of Miller continued to multiply, and required an amount of care, wakefulness, and industry, such as ordinary workmen in whatever department would not desire to encounter. But while indulging his devotedness to science, his chief services were tasked in the religious cause which he had so much at heart, and for which his labours were chiefly in demand. Thus he continued until the memorable year 1843, when the crisis occurred, and the Disruption became an established fact. It was with a sigh of relief that he welcomed this close of a long protracted and harassing uncertainty, and he thus expressed his feelings in the next leading article of the *Witness*: "The Free and Residuary Assemblies have closed their sittings—the over-strung mind of the Scottish public demands its interval of rest; and thrilling excitement and incessant labour give place, for a brief period, to a comparative quiescence and repose. For our own part, for at least a few months to come, we shall see the sun rise less frequently than we have done of late, and miss oftener the earliest chirp of the birds that welcome the first gray of morning from among the old trees of Heriot's and the Meadows. The chapter added to the history of the Church of Scotland has just been completed—the concluding page presents the usual blank interval; and we feel inclined to lay down the volume for a space, and ponder over its contents." But that pondering over the past gave rise in the mind of the editor to dismal apprehensions of the future, to which he gave utterance in these impressive words:—"How very brief a period has elapsed since the government of this country could have settled at small expense the church question! and how entirely has it passed beyond the reach of human adjustment now! In disestablishing the religion of Scotland, there has been a breach made in the very foundations of national security which can never be adequately filled up. The yawning chasm is crowded with phantoms of terror; there are the forms of an infidel Erastianism in front, and surplises, crosses, and triple crowns in the rear; while deep from the darkness comes a voice, as of many waters, the roar of infuriated multitudes broken loose from religion, and thirsting for blood. May God avert the omen! That man must have studied to but little purpose the events of the last twelve days who does not see that there is a guiding hand ordering and regulating all. The pawns of this great game do not move of themselves;—the adorable Being who has 'foreordained whatsoever cometh to pass' is working out his own designs in his own way;—the usurpations of the civil magistrates—the treachery of unfaithful ministers—the errors and mistakes of blind-hearted and incompetent statesmen—all tend to accomplish his decrees; and it would be well, surely, since in one way or other all must forward his purposes, to be made to forward them rather as his fellow-workers than as his blind insensible tools. Let the disestablished church take courage—there is a time of severe conflict before her, but the result of the battle is certain." Such were the views of the wisest upon the great event of their day: it transcended all that had been previously done, and was to form the pivot upon which the fate of Scotland was ultimately to revolve.

But we need not advert to the mellowing effect of years in abating all such anticipations, and reducing events to their due proportion. That which appears to the living generation as the great epic of all time, a few years suffice to convert into an episode.

In the meantime the history of the *Witness* since its commencement had been the history of Hugh Miller himself, as it was the impersonation of his thoughts, his utterances, and his deeds. A journal so pervaded, and by such a commanding intellect, could be of no ordinary merit, and scarcely had it more than started into existence than it secured its place as an authoritative leader of public opinion, and was esteemed one of the ablest and best of our Scottish newspapers. Deeply beneath the surface of society it quarried into the religious and moral evils of the day, making wild havoc alike of these and their perpetrators, so that its editor was as greatly feared and dreaded by the Moderate party in the church, as he was beloved by their opponents. But if his zeal was occasionally blamed as merciless, no one could question its impartiality, and he was as ready to oppose the failings and shortcomings of his own party, as the faults of its adversaries. To maintain the purity of the *Witness* he would not submit it to the dictation of either assembly, presbytery, or oligarchic clique, whether lay or clerical, and to secure its independence he became himself its principal proprietor. In the same high spirit he refused those generous offers by which his liberty of opinion might have been restrained in its utterance, even though they were tendered by his best friends. The money originally invested in the *Witness*, was kindly offered to him through Dr. Chalmers, as an acknowledgment of his valuable services to the Free Church, but firmly declined by the editor. Afterwards, when a party of rich and influential Free-churchmen offered to bestow upon him a mansion, as a testimonial, this also he declined. "I know," he said, "that as the defender of Free Church principles, my intentions have been pure and loyal, but I am not quite sure I have always been successful in doing the right thing, nor have I done anything that is worthy of such consideration from my friends. I believe my way is to make yet." His high literary and scientific fame, and the services his works had rendered to religion at large, made him worthy of some reward, irrespective of church or party; and he was offered a government appointment through the Marquis of Breadalbane. The office, like that held by the poet Wordsworth, was so light, that its duties were little more than nominal, while its salary was a comfortable independence of £800 per annum. This the most tempting offer of all, which pledged him to no new opinions, which came to him in the character of a national honour, and would free him from the heaviest duties of journalism that were becoming too much for him, compelled him to pause and ask a few minutes for consideration. In these few minutes his decision was adopted, and his answer was, "I have made up my mind to refuse. I find my memory not now so good as it was formerly. I forget things I was wont to remember with ease. I am not clear in such circumstances about taking upon me any money responsibility." Having thus decided, no arguments of his friends could persuade him to alter his resolution.

With the commencement of the new Free Church, and the regular progress of its operations, the editorial cares of Hugh Miller had not ended, and the *Witness*, when not employed upon some religious or educational question of the day, teemed with literary dissertations and discussions, that showed the amplitude of his knowledge in every depart-

ment, and the vigour with which he could apply it. Still more abundant were those chapters on science which appeared in a serial form, and were finally republished under the titles we have already mentioned. It was while thus employed that he added to his other cares those of a public lecturer, which he commenced in 1852, and which he continued gratuitously until near the close of his well-spent life. His desire was to popularize science among the working-classes, and make it subservient to the illustration of religious truth; and for this purpose he chose for his principal theme his favourite subject of geology, on which he drew out a series of lectures, afterwards embodied in his *Testimony of the Rocks*. Although so eloquent a writer, and almost equally remarkable by the readiness, eloquence, and correctness of his conversational powers, Hugh Miller was not a practised orator. He had not the versatility and ease of the rostrum, and his commencement was too late in life to acquire them. But, on the other hand, his intellectual superiority was so apparent, and his themes acquired such a new interest from his powers of simplification and illustration, that the absence of the mere graces of rhetoric were dispensed with, and delighted audiences hung upon the charm of his words. Thus it was in Edinburgh, Glasgow, and London, where, in spite of his deficiencies, he was hailed as a lecturer of superior excellence by admiring crowds. It was the triumph of naked unassisted genius over histrionic pomp and ornament. But amidst this expansion of his fame, the canker-worm that had long slumbered at the root was awakened into deadly activity. It was not merely that his memory was failing, as he had himself acknowledged—that was an event which was certain sooner or later to happen with one who had written so much and upon such a variety of subjects. But even in childhood he had been an enthusiast, and his constitutional enthusiasm had been of that unhealthy kind which sees ghosts, and devoutly believes in omens and prodigies. His entrance into the world of reality, and commencement of the stern battle of life, had been sufficient to exorcise these phantoms, and had his career been more peaceful they might have fled for ever; but the path he had chosen was such as to welcome their return, and prepare a swept and garnished home for their reception. Little did the public guess when the conflict seemed at an end and the victory won—when he walked among them one of the most honoured and distinguished of the day—when his shaggy head was still brown, and his athletic strength in the prime of manhood, that the stalwart intellectual stone-mason, whose gray plaid and russet attire which he wore to the last, and whom strangers on Prince's Street looked at in wonderment, when they were assured that was the world-famed Hugh Miller—little did the public guess that all this glory, and greatness, and true worth, were accompanied with a jarring nerve in the brain under which all availed him nothing. Alas that such an earnest pursuit of knowledge, by which the world has been so much enriched, should be so fatal to the owner, and that one so ennobled by all that is excellent in the religious character, should have been visited by such a fearful and mysterious doom!

The closing period of his life was spent at Portobello, in a large sea-side mansion he had purchased, and to which he had added a museum enriched with specimens of geological and scientific exploration, which had accumulated during a long course of years. Here his days were spent surrounded by wife, children, and friends, and amidst such means of enjoyment as seemed to realize the scholar's utmost dream

of a happy honoured independence. But indications of a wavering intellect were occasionally appearing, which were cautiously concealed even from his physician, until the evil was confirmed, and the revelation made when too late. Haunted by the dread of robbers and assassins in his evening journeys from Edinburgh to Portobello, he carried a loaded revolver in his pocket. A still more causeless apprehension that his museum would be robbed, made him add to the revolver a broad-bladed dagger and claymore, which on retiring to bed he placed within reach of his hand. His sleep was broken or made worse than useless by somnambulism or wild harassing dreams, and his frequent idea on waking up in the morning was that he had been led or dragged by witches whole miles during the night, under which impression he would examine his clothes to see if they were wet or covered with mud—and when he found them all right, he was only the more convinced that he was the victim of supernatural and hellish influence. And yet, during the day, his strong mind rallied and recovered its wonted healthiness, and neither from his looks nor his conversation could his friends surmise that such terrible struggles had been going on under such an unruffled surface. His only chance of cure, or even of temporary relief, would have been the entire abandonment of literary labour; but the power to stop had already forsaken him—and his last days, even his last hours, were given to the revision of the proof-sheets of his *Testimony of the Rocks*, although there was no urgency for their immediate preparation. In like manner, when the physicians had examined his case and issued their prescriptions, he could not be persuaded to take the medicines. As his studies were at irregular hours, often extending far into the morning, and his wife's health was delicate, he occupied alone a sleeping-room at a distance from the family—and there, on the fatal night of the 24th of December, 1856, he must have been attacked by one of his horrible trances that had proved too strong for him, while the opportunities of self-destruction were unfortunately within his reach. On the next morning his body, half-dressed, was found lying dead upon the floor, his left lung being pierced by a bullet from his revolver, while the pistol itself had fallen, or been thrown, into the bath which stood close at hand. On looking round the room, a folio sheet of paper was found lying on the table, and on the centre of the page the following farewell written to Mrs. Miller, probably one moment before the fatal deed was perpetrated:—

"Dearest Lydia,—My brain burns. I *must* have walked; and a fearful dream rises upon me. I cannot bear the horrible thought. God and Father of the Lord Jesus Christ, have mercy upon me. Dearest Lydia, dear children, farewell. My brain burns as the recollection grows. My dear dear wife, farewell. HUGH MILLER."

Of this startling heart-rending farewell, written by such a man and under such circumstances, Dr. Hanna, the eloquent biographer of Dr. Chalmers, has justly observed:—"What a legacy of love to a broken-hearted family! and to us and all who loved him, how pleasing to observe that in that bewildering hour, when the horror of that great darkness came down upon that noble spirit, and some hideous shapeless phantom overpowered it, and took from it even the capacity to discern the right from the wrong, humility, and faith, and affection still kept their hold—amid the ruins of the intellect, that tender heart remaining still unbroken! These last lines remain as the surest evidence of the mysterious power that laid his spirit prostrate, and of the noble

elements of which that spirit was composed—humble, and reverent, and loving to the last.”

MILTON, LORD. *See* FLETCHER (ANDREW).

MINTO, EARL OF. *See* ELLIOT MURRAY KYN-
NIMOND (GILBERT).

MITCHELL, SIR ANDREW, K.B. This able and influential politician, whose history is so intimately connected with that of Frederick the Great, was born in Edinburgh on the 15th of April, 1708. He was the only son who reached maturity of the Rev. William Mitchell, one of the ministers of St. Giles' Church, Edinburgh; his mother was Margaret Cunningham, eldest daughter of Sir Hugh Cunningham of Craigends. While still under the age of twenty-one, Andrew Mitchell married his relation, Barbara Mitchell, the heiress of Thainston in Aberdeenshire; and the cause of this early union was an attempt which had been made to carry off the young heiress, who was unprotected, and espouse her against her will. But brief was the happiness of the young couple, as Mrs. Mitchell died a short time after giving birth to a daughter, who died in infancy. The grief of the husband on account of the decease of his wife was not only acute but lasting, and influenced the whole course of his future life; for, being unable to continue his studies for the Scottish bar, which he had selected for his profession, he sought consolation in travel, which gradually introduced him into a more public and eventful course of life. Amidst these changes he never again married, or resided in his native Scotland. After visiting several countries on the Continent, he became in 1733 a member of the Middle Temple, London, and in 1738 he was called to the English bar. But before he could establish himself in practice, if indeed he had ever sought it, his proper vocation in life found him, and in 1742 he was appointed under-secretary to the Marquis of Tweeddale, principal secretary of state for Scotland. It was an office and a time which furnished material enough for the training of wise skilful politicians. The Jacobite intrigues for the restoration of the Stuarts, which were the matters of life-and-death importance of the period, burst out into more alarming action than ever, and the violence of the rebellion of 1745 was followed by still greater violence for its suppression. Between the two parties also, while their blood was at the hottest, even the most loyal and peaceful were in the situation of the poetical non-combatant at Sheriffmuir, who was menaced with death by the Jacobites, and had his pockets picked by the royalists. Mr. Mitchell was a close observer of these double excesses, and by no means an uninterested one, as several of his own friends devoted to the Hanoverian cause were sufferers by both parties. His public position also brought him into contact with some of the principal leading spirits of the day, among whom it is enough to mention Duncan Forbes of Culloden. The tale is too well known of the shameful neglect manifested towards the latter by an ungrateful government after his labours and sacrifices had mainly tended to establish the Hanoverian succession upon the British throne. The president, when dying all but broken-hearted at such treatment, thus counselled his son John by letter, “I would advise you to go to London, where I believe I may have some friends yet. Mr. Scroop, Mr. Littleton, and Mitchell are kind-hearted, affectionate men, and they will tell the king that his faithful servant, Duncan Forbes, has left you a very poor man.” In his last moments, also, the president showed that his friend was still uppermost in his

remembrance. Bemoaning the poverty in which he would leave his son, he said to him, “Andrew Mitchell loves you affectionately; he will advise you, and do what he can for you.” To have been so thought of by such a man as the president, and when memory and life were on the verge of extinction, shows how high and how lovable the character of Mitchell must have been.

It was now the wish of his friends that he should have a seat in parliament, and this feeling accorded with his own. His fortune was not large; he had renounced the profession of the law, and the public service, into which he had now been initiated, seemed the only path open to his active enterprising spirit. He therefore stood for the county of Aberdeen, and was elected its representative on the 28th of July, 1747. On entering parliament he only addressed the house occasionally; but it appears that he was frequently consulted by the ministry on the affairs of Scotland. It was not as a political orator that he was to obtain his chief distinction. His value, however, was appreciated, as appears by the appointments which were successively conferred upon him. In 1751–52 he was made one of his majesty's commissioners at Brussels for settling a treaty of commerce with commissioners appointed on the part of Austria and Holland. In consequence of a new writ ordered for the Elgin burghs, he was returned for that district in December, 1754, and continued to represent it until his death, although an absentee from the country. But the most important appointment occurred in 1756, when Mitchell was selected as British envoy of George II. to the King of Prussia, then about to commence the memorable Seven Years' War.

The causes of this war, in which Mitchell, although a non-combatant, bore so important a part, may be very briefly stated. The ambition of Frederick, afterwards surnamed the Great, and the ease with which it was fancied he might be overcome, and his little kingdom of Prussia partitioned, had raised up enemies against him on every side, and his danger was at the crisis when both France and Austria combined against him. In consequence of the personal dislike of George II. to his cousin of Prussia, and his desire to preserve his Hanoverian possessions (for which he would at any time have sacrificed his three kingdoms), the enemies of Frederick had been befriended and subsidized by the British court. But, in consequence of the coalition of France and Austria against Prussia, and the refusal of these powers any longer to protect the Low Countries, and especially Hanover, the tide of British politics underwent a sudden and violent change, and George II., laying aside his personal animosities, formed an immediate alliance with Prussia. It was to watch over his sovereign's interests, so far as the safety of Hanover was concerned, that Sir Andrew Mitchell, who was soon after created a knight of the Bath, was now appointed ambassador extraordinary and plenipotentiary at the court of Berlin.

This was an office which, owing to its dangers and difficulties, few statesmen would have coveted. A little kingdom, poor and still in its childhood, and with a population of only five millions, had wealthy and powerful kingdoms, containing sixty millions of souls, combined against it. Nor was it a combination of barbarians against the civilized, where intellectual superiority might have matched the brute force opposed to it; but a meeting of equals, in which the greater number is generally thought certain to prevail. Against such odds, if the weaker could even stand its ground, it could only be under such a leader as history exhibits but once in the course of five

centuries, for the envy or astonishment of mankind. In the trial we know that Frederick proved himself such a man; but as yet the trial had only commenced, and all but himself feared for the result. And being sent as ambassador to a sovereign under such desperate circumstances, and where he might share in the obloquy of disaster and defeat, Sir Andrew could not comfort himself in the thought, that at the worst he would still be safe in some snug ambassadorial residence at Berlin. By the express orders of his sovereign he was to attend Frederick in all his campaigns, and thus passively endure all their dangers and privations, without entering the active struggle of the fight that makes danger unknown and fear unfelt. It was some such situation as the novelist Smollett, a contemporary of Mitchell, assigned to Roderick Random, when he perched him aloft in the cradle of the mainmast, with his feet in the bilboes, amidst the close and heavy cannonade of a sea-fight. But Sir Andrew did not shrink from a duty so trying. He accompanied Frederick through the campaigns of the Seven Years' War, and was by his side during their hardest fought battles, especially at Zorndorff, when cannon-balls fell around them like hail. In this way he endured the dangers of war but without any share of its glory, and acquired the practical experience of a general without the slightest prospect of reducing it to use. Still it was better to live among such stirring scenes than to nurse a widowed heart in a companionless home, or inhabit a country torn by factions, and with the wounds of the late civil war unhealed. Even the hardships of the Prussian camp or the dangers of the battle-field were better than such an alternative.

To follow the course of Sir Andrew Mitchell through these campaigns would be to give a history of the war, which is not our intention. It would be equally unnecessary to detail his diplomatic proceedings, merging as they did more or less into the political movements of the day. It is more to our purpose to give a few traits of his individual character and proceedings, and in this we cannot do better than betake ourselves to Thiebault's *Original Anecdotes of Frederick II.* His account of the British ambassador is as follows:—"Sir Andrew Mitchell, knight of the order of the Garter,¹ had been for several years the English ambassador to Berlin when I first arrived there; some time, however, elapsed from this time before I had the least acquaintance with him, not only because it was little to be expected that Englishmen should be desirous of the society of Frenchmen, but also because Sir Andrew Mitchell was of the number of those meritorious characters who stand in no need of perpetual society to his existence, and have the philosophy to prefer being occasionally alone. When he first arrived at Berlin, he had caused the persons who necessarily invited him to their houses considerable perplexity; for he played at no game of cards, so that his hosts constantly said to each other, 'What shall we do with this Englishman who never plays at cards?' In a few days, however, the contest was, who should withhold himself from the card-table, and have the advantage of conversing with a man in whom they had discovered every requisite to afford the highest pleasure in colloquial intercourse. In reality his understanding was no less admirable than the virtues of his character. Of this I cannot give a more substantial proof than by observing, he was united by the strictest bonds of friendship with the author of *L'Esprit des Lois*."

Many of his bon-mots came into circulation, and

were long afterwards remembered; and of these Thiebault has recorded a few, which exhibit both humour and good sense. On one occasion when three English mails were due, Frederick said to him at the levee, "Have you not the spleen, M. Mitchell, when the mail is thus delayed?" "No, sire, *not* when it is delayed, but often enough when it arrives duly," was Mitchell's reply. He was often dissatisfied with the proceedings of his own court, and had good cause of being so.

During the momentous events of the Seven Years' war, when the fate of the great Frederick so often was perilled upon contingencies which did not depend upon himself, the English government had promised to send a fleet to the Baltic for the protection of commerce, and to keep off the Swedes and Russians. The fleet never appeared, and the Swedes were enabled to transport their army with all its stores and munitions to Pomerania, and also provisions to the Russian troops, and to lay siege to Colberg. It was a breach of promise very damaging to the interests of Frederick, and which of course he acutely felt, while Sir Andrew was at a loss how to answer the king's complaints, or apologize for the omission. Hitherto he had been daily invited also to dine at the royal table, but now this distinction was withheld. The generals meeting him about the hour of the king's dinner, said to him, "It is dinner-time, M. Mitchell." "Ah, gentlemen," he replied, "no fleet, no dinner!" This being reported to Frederick, he renewed the wonted invitation.

After the affair of Port Mahon the king said to him, "A pretty beginning you have made, M. Mitchell! What! your fleet beaten, and Port Mahon taken in your first campaign! The trial in which you are proceeding against your admiral Byng is a bad plaister for the malady. You have made a pitiful campaign of it; that is certain." "Sire, we hope, with God's assistance, to make a better next year." The king sneered, and exclaimed, "With God's assistance, say you, sir? I did not know you had such an ally." "We rely much upon him," replied Sir Andrew, "though he costs us less than our other allies." "Spare no expense with him," rejoined the other; "you will see he will give you money's worth for your money."

Among the faults of Frederick the Great was an unhappy tendency of uttering bitter sarcasms not only against his enemies, but his allies when they displeased him—a practice by which he was apt to abate the zeal of his well-wishers, and convert those who were neutral into downright foes. The king indeed valued himself as much upon his wit as his victories, and was of that class of men who would rather lose his friend than his jest. In this way he had provoked almost every court of Europe, with which he was now at war; even Britain, his only ally, was the frequent subject of his caustic mots. These, however, Sir Andrew, who loved the king for his many great qualities, kept concealed from his own government, well knowing what irritation they would produce. His reticence displeased the English minister at home, and in writing to Mitchell he expressed his wish that the latter would include some of these splenetic effusions in his official despatches. Sir Andrew's answer was wise and temperate. He said "that, in accepting his mission, he considered himself as intrusted with the care of maintaining and strengthening the ties that existed between his country and a valuable ally; that his desire had been to prove a minister of peace and union; that if it were intended to make of him a minister of hatred, pitiful bickerings, and despicable tale-bearings, he wished nothing more than that they would name him a suc-

¹ A foreigner's mistake for the order of the Bath.

cessor immediately, as he should never be prevailed upon to play a part so unworthy of his sentiments and character; that it was not on this account to be believed he was less devoted to his country than the persons they might appoint to succeed him; that he knew perfectly how to distinguish between what was of a nature to be injurious, and what was merely indifferent; that if any change should happen in the dispositions of his Prussian majesty, this he could not fail to be informed of, and would have lost not a moment in his communications to the court of London; but he begged them to consider that all the circumstances they had particularized in their letter, and with which he was perfectly acquainted at the time, were nothing more than the first impulses of a man possessed of no less irritability of temper and sensibility than of genius; that they might even have been nothing more than simple pleasantries, brought forward either with the intention of deceiving some of his hearers, or to put them off their guard as to what they might themselves have to conceal; that, in a word, it was his duty to remind them, that to judge accurately respecting a man so extraordinary, or even of what he says, it was doing little indeed to collect the mere words he uttered, if to these were not added a knowledge of the time in which they were pronounced, under what circumstances, and with what views." This account of his official reply Sir Andrew communicated to Thiebault, and added, "Well, my remonstrance produced the effect I desired. I never was ignorant of all the bitter sarcasms and little epigrammatic railery that issued from the king against whoever fell in his way; but I carefully avoided mentioning them in my official despatches. I was never afterward solicited on this point. I should blush for the vocation I follow, if I were compelled to descend to such disgraceful meddling."

His health having been considerably injured by the anxieties and fatigue of the campaigns during the Seven Years' war, Sir Andrew in 1765 visited England, in the hope of recruiting his health by a change to his native climate. In the following year he returned to Berlin, and resumed his diplomatic duties, which he continued to discharge uninterruptedly until his death, after a short illness, on the 28th of January, 1771. Faithfully and ably though he had served his government, he was so poorly requited that he was scarcely richer at his death than when he entered upon office; but he lived at a period peculiarly one of political selfishness, in which our statesmen were too intent upon the payment of their own services to recognize the merits of others. Now that the cloud has cleared away, and his services been estimated according to their real worth, he has been declared by competent judges "the best ambassador England ever had." The funeral of Sir Andrew was attended by the court of Berlin, and it is said that the stern cold Frederick, who looked at the procession from a balcony, burst into tears. His personal appearance has been thus described by his biographer and descendant:—"Mitchell has been described by those who remember him as in person a man strongly built, and rather above the middle height, and as 'taking in his manners, though bluntish.' His countenance, as depicted in a very good portrait of him at Thainston, in his robes of a knight of the Bath, is that of a bold, open, straightforward, and withal most sagacious man. It is somewhat broad and bluff, with thought and resolution visibly written in every line of the broad forehead, the strongly-marked nose, the massive chin, and firm full lips, as well as the well-opened clear blue eyes. The features altogether are expressive of the honesty, sagacity, and goodness, and the quiet resolution, the silent un-

obtrusive courage, which formed the character of the man. "What has been said by a great living writer of an illustrious countryman of Mitchell, I think I may venture to apply to Mitchell, that 'when he departed he took a man's life along with him.'"

MITCHELL, MAJOR-GENERAL JOHN. This literary soldier was born in Stirlingshire on the 11th of June, 1785. His father, Mr. John Mitchell, an able and accomplished diplomatist, had distinguished himself in early life, first as attaché to the British legation under Mr. Elliot, afterwards Earl of Minto; and subsequently as consul-general in Norway. In this last situation, when the American war and the early revolutionary movements in France had disturbed the commerce of the northern European states, he was intrusted in 1787, by the Duke of Leeds, at that time our foreign secretary, to examine and report on the maritime trade, the departments of industry, the revenue, and the military and naval forces of the northern kingdoms. This he did, and his report was so full and able that he was thanked for it by the Board of Trade, before which it was read by the president, Lord Hawkesbury. Some years later he was engaged in missions to the courts of Stockholm and Copenhagen; and having been sent in 1797 to Berlin, when William III. had just ascended the throne, he there placed his son, John, then a boy twelve years old, in the Ritter academy at Lüneburg, a seminary of high reputation, and which limited its pupils to the sons of the nobility. After an active and useful political life, Mr. Mitchell died at Edinburgh on the 17th of October, 1826.

At the Ritter academy of Lüneburg John Mitchell distinguished himself by the study of languages, geography, and history, and acquired that love of German literature which afterwards qualified him to be the biographer of Wallenstein. In 1801 his education was transferred to a mathematical academy in London, taught by Mr. Nicholson, a gentleman who had gained considerable reputation by his writings on scientific subjects, and of whose instructions Mitchell during the rest of his life entertained a pleasing recollection. Having finished his military education, John Mitchell in 1803 was commissioned in the 57th regiment, and afterwards transferred to a lieutenancy in the Royals, at the express desire of the Duke of Kent (the father of her majesty, Queen Victoria), who was its colonel, and who wished to have him in his regiment. He soon after was sent to active service in the West Indies, and in 1807 was promoted to the rank of captain; he subsequently continued to serve in the West Indies until he was removed with his regiment to Valcheren. After having weathered that disastrous campaign, in which swamps and malaria were more destructive to the British than all the other calamities of war combined, Captain Mitchell served from 1810 to 1812 in the Peninsula, and was engaged in the battles of Busaco and Fuentes d'Onore, for which he received the war-medal and two clasps. He afterwards accompanied the expedition to Germany under General Gibbs in 1813, and during the following year he served on the quartermaster-general's staff in Holland and Flanders, and went with the army of occupation to Paris. It was chiefly as a linguist, however, that his services at this time were in requisition; and as he was acquainted with nearly all the European languages, he was frequently employed by the Duke of Wellington in his correspondence and negotiations with the allied powers.

With the establishment of peace throughout Europe, and the exile of Napoleon in St. Helena, the military life of Mitchell was ended. But in

hanging up his sword to rust upon the wall, he did not, like too many of his brethren, feel that his sole occupation was gone, and that for all the purposes of life he too might accompany his sword. A nobler career still lay before him, and a second harvest awaited him that was richer than the first. During his military life he had not contented himself with being merely a military machine: on the contrary, it was the intellectuality of his profession that he loved; and to make himself master of it, he had studied war as a science both in its modern and ancient applications, as illustrated in the deeds of nations and heroes. He thus combined in himself a full knowledge of the subject both as to theory and practice, a union which few military historians can boast; while his intellectual character and habits had furnished him with the pen of a ready writer. It was natural therefore that he should write of martial deeds, and write well upon subjects with which he was so conversant. The life of Major-general Mitchell was henceforth to be that of a military biographer and historian.

At the age of forty-five, with a mind stored and a judgment matured, he became an author in earnest. The commencement also was with light anonymous attempts, by which he could feel his way, and acquire the necessary knowledge of the mechanical part of his new profession. This commencement seems to have been made in 1830, but what were his first attempts we have been unable to ascertain. It is only known that in the years 1833 and 1834 he published a series of articles in *Fraser's Magazine*, fifteen of these being military sketches and biographies, and seventeen light and humorous sketches on men, fashions, and things in general, the whole under the assumed name of Captain Orlando Sabretash. These papers, by their talent, spirit, and valuable information, arrested the public notice, and excited much inquiry as to the real name of their author. Having thus made fair trial of his literary capacity, he resolved to attempt some great single historical composition, and the result was the *Life of Wallenstein, Duke of Friedland*, which was published in 1837, and of which a second edition appeared in 1853. To the choice of such a subject Mitchell was probably directed by his early sojourn and education in Germany, and by his chivalrous desire to vindicate the character of a distinguished hero, who has been undeservedly buried under a cloud of calumny, which but lately has begun to clear away. The earnestness of the author's interest in his subject was manifested not only by his study of every source that might throw light upon it, but by his repeated visits to the principal places where Wallenstein's exploits were performed—and the effect of all this pains and research was greatly to clear the character of the hero from those charges of treason by which the court of Vienna attempted to justify his assassination. It is superfluous to add, that Mitchell's work gave stimulus to fresh inquiry, and that Wallenstein's innocence of the imputed crime is now generally recognized.

In 1838, a year after the *Life of Wallenstein* was published, Mitchell produced his "*Thoughts on Tactics and Military Organization*, together with an Inquiry into the Power and Position of Russia." That this work was by no means unnecessary or useless has been shown by the fact, that several of the military reforms introduced of late years may be traced to his suggestions. Most of the essays in this volume had been previously published in the *United Service Journal*.

The next publication of Major-general Mitchell was the *Fall of Napoleon*, a historical memoir in three volumes, which issued from the press in 1845.

In this work he abates much of the marvellous which so dazzled and captivated in the deeds of Napoleon, and endeavours to show that his victories were more owing to the skill of his subordinates and the valour of his troops, than to his own combinations and arrangements. This work was acceptable to all who were not worshippers or admirers of the modern Cæsar, and the following judgment of it was expressed by Sir Robert Peel, in a letter to the author:—"I think it very important to the cause of truth that there should be some severer and more impartial scrutiny into the real merits of military achievements than it is usual to institute. It was in this work that I first read the facts stated with respect to the battle of Marengo, and to the authorized history of that battle. I am not aware whether they have been contradicted or questioned by French military writers, admirers of Napoleon. If not, they naturally provoke inquiry into every other achievement for which he has the credit of signal success." The following congratulatory epistle also from Varnhagen von Ense, one of the ablest historians and critics of the day, to Mitchell, must not be omitted:—"Your work on Wallenstein has sufficiently established your powers as a historian and historical investigator, and the one on Napoleon again proves this in the most brilliant manner. It at the same time, and at the first glance, shows the great advantage which arises when military subjects are described by the hand of a soldier. I hope, and I am sure every friend of true and impartial history does so with me, that you may yet have many opportunities of writing on similar subjects."

In the year after the publication of the *Fall of Napoleon*, Mitchell resumed the literary recreation of contributing to *Fraser's Magazine*, by a series of nine essays *On the Principal Campaigns in the Rise of Napoleon*, which formed a kind of introduction to his work on the "Fall" of that hero. His last work published, although not latest written, appeared in 1842, under the title of "*The Art of Conversation*, with Remarks on Fashion and Address, by Captain Orlando Sabretash." A work which was published in 1865, after his death, entitled *Biographies of Eminent Soldiers of the last Four Centuries*, was a collection of memoirs written by Major-general Mitchell, and edited by Leonhard Schmitz, LL.D., from whose biography of the author, with which the publication is prefaced, the foregoing facts have been derived. Mitchell's intervals of leisure between these more serious attempts were employed for the improvement of the army and of military science, which he had so much at heart, and for this purpose he regularly contributed to the *United Service Journal* from 1841 to 1855, besides writing a series of seven letters in the *Times* from 1841 to 1842. The gist of these communications was the defects in the British army, and suggestions for the improvement of our military establishments; and among the evils he complained of, that of promotion by purchase was not the least conspicuous, or the most tenderly handled. During the later period of his life he had also made considerable preparations for writing a *Life of the Duke of Alba* (or *Alva*, as the name sometimes appears in histories), but the great difficulty of obtaining access to authentic documents compelled him to abandon the design.

While Mitchell during so long a portion of his career had exchanged his sword for the pen, his military promotion was not neglected. In 1835 he was raised to the rank of lieutenant-colonel "unattached," and in 1854 to that of major-general. After peace had succeeded the battle of Waterloo, he always spent a considerable portion of every year on the

Continent, occupying his time partly in intercourse with old associates, and partly in collecting materials for his literary productions; but after 1848 his failing health confined him to his native country, and he generally resided in the house of his sisters in Edinburgh, employed chiefly with his studies, which had now become to him an important necessary of life. He died in Edinburgh on the 9th of July, 1859, and his remains were buried in the family vault in the Canongate Churchyard.

Although a man of very handsome exterior, of pleasing manners and address, great conversational powers, and a happy buoyant spirit which he retained to the last, General Mitchell was never married: study was his bride, and the books which he wrote were his children. And how completely he identified his character with his authorship—how all his writings were pervaded with his own individual qualities, the slightest perusal of them will suffice to show. Whether investigating a historical difficulty, or describing an important event, he is always cheerful and always in earnest; while his style, which is lucid, simple, and forcible, brings out into strong relief whatever he aims to inculcate. Little indeed is known of his career as a soldier beyond what we have mentioned; but in his superior excellence as an author, and the interesting works he has written, the public at large is reconciled to the defect.

MITCHELL, SIR THOMAS LIVINGSTONE. This distinguished traveller and explorer in the unknown fields of Australia was the son of John Mitchell, Esq., of Craigend in Stirlingshire, and was born at his father's residence in 1792. As the eldest son of the family and representative of the Mitchells of Craigend, Sir Thomas held the additional name of Livingstone, which had been assumed by his predecessors in consequence of the marriage of a laird of Craigend with the heiress of J. Livingstone, Esq. of Halning, brother to Lord Viscount Kilsyth, who was attained in 1716. When only sixteen years of age, Thomas Livingstone Mitchell entered the army serving in Portugal, and was on the staff of the Duke of Wellington until the close of the Peninsular war, by which time he had attained the rank of major. During this period of service his talents as a military surveyor were so highly distinguished, as to attract the attention of the late Sir George Murray, on whose recommendation Major Mitchell was sent back to the Peninsula to make surveys of the ground on which the great battles of the war had been fought. The military maps which he constructed from these surveys are preserved in the Ordnance Office, and are admirable specimens of accuracy and professional skill. In 1818, when all prospect of war had subsided, he married the daughter of Lieutenant-general Blunt, after which there is little record of his proceedings until 1827, when he published *Outlines of a System of Surveying for Geographical and Military Purposes*, 8vo, London. It is possible that this publication recalled him to the memory of the ruling powers, when his services were most needed; and in the same year he was appointed deputy surveyor-general of New South Wales, under Mr. Oxley, whom he afterwards succeeded as surveyor-general. Australia was now the home of Major Mitchell, and here, with the exception of some necessary visits to the mother-country, he resided until the close of his life.

The ordinary duties of his office at this time were of no easy or trivial character. The country was so wide, and its occupation so recent, that its nature and extent were still unknown; and beyond the British settlement, which formed comparatively but

a stripe of it, all the rest was a sort of *terra incognita*. As such, however, it was a tempting field for exploration, and not the less so that, unlike Africa or the northern regions, the whole field was our own. It was a country for such a man as Major Mitchell, and he resolved to alternate the routine of his office with the more laborious and hazardous duties of exploration and discovery. The first occasion for enterprise seemed at hand, in consequence of the capture by the colonial police of a runaway convict who had escaped into the interior, assumed the habits and appearance of a native, and signaled himself among the wild tribes by organizing a system of foraging upon the white men's cattle. On being apprehended he endeavoured to obtain the remission of his offences by a circumstantial account of the unknown regions of the interior, and especially of a large river called the Kindur, by following which in a south-west direction he had twice, as he alleged, reached the sea. The bait was tempting and quickly swallowed; and Mitchell, in 1831, accompanied by ten selected men, set off on an expedition which had for its chief object the discovery of this miraculous river. But it was as unreal as a *mirage* of the sandy desert, and the convict upon whose testimony they had set out acknowledged its worthlessness by breaking prison, and escaping to his old haunts in the bush. But although no Kindur was found, the discoveries made by Mitchell in this exploratory expedition were consolation enough for the disappointment. After a journey of 300 miles northward from Sydney, a distance which at this time formed the boundary of the British settlement, he advanced into the unknown regions; and during four months continued his investigations, by which much valuable information was added to our knowledge of the country, and its capacities for industrial occupation, besides ascertaining the existence and course of the rivers Peel and Nammo, in which the report of the runaway convict was found correct, and for which his life, on his subsequent apprehension, was spared by the New South Wales government. The beneficial effect of these discoveries was, that grazing establishments for cattle were soon formed in the most eligible parts of the new districts, and future localities fixed for colonial settlement and cultivation.

After this expedition of 1831-2 Major Mitchell resumed the ordinary duties of his department, and the construction of roads and bridges which had been placed under his direction, until his services as a traveller were once more required in exploring the course of the river Darling. As failure in the means of water-conveyance had formed the chief obstacle of the former expedition, the major was provided on the present occasion with two light whale-boats, and a boat-carriage, expressly built for the purpose. Accompanied by a larger party than before, he commenced his journey at the end of March, 1835. It was an equipment fit for such an undertaking. "The boats," he writes, "appeared to *swim* very well in the boat-carriage, which was followed by seven carts, and as many pack-horses, affording the means of carrying provisions for five months. Two mountain barometers were borne by two men, this being the only service required of them while the party was travelling. The whole party in motion towards the unknown interior, and prepared for sea or land, was to me a most gratifying spectacle." After crossing the Blue Mountains, and leaving the plains of Bathurst behind them, the operations of the expedition were commenced 170 miles from Sydney. On reaching the Darling, after a journey of 500 miles, and erecting a stockade, which in honour of the governor was named Fort Bourke, they proceeded,

using both land and water conveyance; and after an absence of two months and two days from the fort, they had travelled 600 miles in direct distance. Returning to Fort Bourke, after having traced the course of the Darling, they continued their homeward course by the river Bogan, and arrived at Sydney in September. This journey made fresh and important additions to the map of Australia, but not without the cost of great toil and danger; for in addition to the miserable sterility of the soil in its natural state, and the scarcity of animals and water, by which their subsistence was rendered precarious, there was the treachery of the natives, whose interest it was to mislead the travellers on their route, and their readiness to murder every white man who strayed from his companions or fell behind them in their march. In this manner Mr. Richard Cunningham, who was attached to the expedition as botanist, on wandering from the encampment was set upon and treacherously murdered by the savages.

After his return to head-quarters Major Mitchell was soon to be recalled into his favourite field of enterprise. Towards the end of the same year (1835) the desire of the governor of New South Wales was intimated that the survey of the Darling should be completed with the least possible delay. For that purpose his excellency proposed that the major should return to the point which his last journey had reached; and that after having traced the Darling into the Murray, he should embark on the latter river, and proceed upwards by water as far as practicable, and regain the colony somewhere about Yass Plains. He set out early in the following year, having most of the equipment of his former expedition still fit for use; his party on this occasion consisting of an overseer and storekeeper, six bullock-drivers, two blacksmiths, three horse-carters, one medical attendant, a collector of birds, a collector of plants, two sailors, a shepherd, a groom and trumpeter, two carpenters, a shoemaker, and a cook. With this curious little nomade army, and a drove of cattle to serve for draught and subsistence by the way, Mitchell resumed his quest. Having retraced the steps of his former route, and reached its termination, the major and his followers advanced into unknown regions which the foot of the white man had never traversed. He found the point where the Darling joins with the Murray, and besides accomplishing the chief object of his expedition, he discovered new regions and new tribes, of which he has given an interesting account. But how completely the hand of industry is already altering the aspect of these districts!—and how the tribes are melting away in the process! In a few years more the records of Mitchell and other Australian travellers will form the only memorial of the numerous tribes who inhabited the vast continent of Australia. In 1838 the major published in London an account of his colonial travels and discoveries, in a work of two volumes 8vo, with the following title, “*Three Expeditions into the Interior of Eastern Australia, with Descriptions of the Recently Explored Region of Australia Felix, and the Present Colony of New South Wales.*” These narratives, besides giving a full account of the regions he surveyed and the useful discoveries he made, are accompanied with maps illustrative of the country and his route, pictures of its natural productions and phenomena, portraits of the principal chiefs with whom he came in contact, and sketches explanatory of the manners and customs of the aborigines. A short time before this work appeared, he had published his “*Map of the Colony of New South Wales*, compiled from Actual Measurements with the Chain and Circumferentor, and accord-

ing to a Trigonometrical Survey, in Three Sheets.” For the purpose of superintending these publications he found it necessary to come to England; and in 1839, on presenting the maps of this most important addition to the British empire, the honour of knighthood was conferred upon him by her majesty Queen Victoria. He was also elected a fellow of the Royal Society, and of the Geographical Society, and invested with the honorary degree of D.C.L. by the university of Oxford. Soon after he returned to his professional duties in New South Wales.

Although now graced with such literary and scientific distinctions, Sir Thomas Mitchell did not seek repose so long as any work was left for him to perform; and in 1845 he set out upon a new expedition, the chief object of which was to discover a route from Sydney to the Gulf of Carpentaria. The benefits of such a discovery were so obvious, that a desire was prevalent among the colonists that the attempt should be made. At this time a trade in the horses of New South Wales to remount the Indian cavalry had commenced, but the communication of the Australian colony with India was impeded by the dangerous navigation of Torres Straits. The Indian Ocean being also connected with England by steam navigation, it was desirable that a way should be found to the shores of that ocean by an inland route from Sydney to the head of the Gulf of Carpentaria—a feat which at the time it was thought possible to accomplish. It was thought also, from a study of the map of Australia, that a considerable river would be found which terminated at the Gulf. But although every preparation had been made for the expedition that prudence and experience could suggest, and although the party consisted of twenty-nine persons, and was provisioned for a twelvemonth, it was unable to reach the Gulf of Carpentaria, owing to the loss of horses and cattle from drought and want of pasture. Sir Thomas, however, advanced as far as $21^{\circ} 30'$ S. lat.; and was the first to discover the river of which he was in search, and which he named the Victoria. He was gratified also by seeing that it took a north-western course towards the gulf. Animated by this promise of a full discovery, Edmund B. Kennedy, Esq., the assistant surveyor of the colony, who accompanied this expedition as second in command, retraced the route in 1847, but found that the river makes a great bend to the southward, and he traced its course in that direction as far as $26^{\circ} 14'$ S. lat. Here his attempt ended, and, as in the case of Sir Thomas, he was compelled to return from want of water and pasturage. On the return of Mitchell from this his fourth expedition, he published an account of it in 1848, under the title of “*Journal of an Expedition into the Interior of Tropical Australia, in search of a Route from Sydney to the Gulf of Carpentaria.*” 8vo, London. In the preface to the narrative he thus sums up the enterprise and its results: “The journey narrated in this work was undertaken for the extension of arrangements depending on physical geography. It completes a series of internal surveys, radiating from Sydney towards the west, the south, and the north, which have occupied the author’s chief attention during the last twenty years; and, as on former occasions, it has enabled him to bring under the notice of the men of science some of the earth’s productions hitherto unknown. . . . The new geographical matter is presented to them with confidence in its accuracy, derived as it is from careful and frequent observations of latitude; trigonometrical surveying with the theodolite, wherever heights were available; and by actual measurement of the line of route. This route was connected, at its commencement and termina-

tion, with the trigonometrical survey of the colony; and in closing on Mount Riddell a survey extending two degrees within the tropics, the near coincidence of his intersections with that summit, as fixed by his survey of 1830, could not but be very satisfactory to the author." The zeal of Sir Thomas in every department of science is attested by the following concluding paragraph of the preface: "The geological specimens collected during this journey have been deposited in the British Museum, and their original locality is shown on the maps by the numbers marked on the specimens, so that they may be available to geologists; hence, in the progress of geological science, the fossils now brought from these remote regions will be accessible at any future time, and something known of the geology as well as of the geography of the interior."

After his fourth and last expedition into the interior of Australia had been accomplished, Sir Thomas Mitchell returned to the wonted duties of his office, which had every year been increasing in magnitude and importance. His solicitude for the advance of colonial education in the right direction was shown in 1850, when he published an excellent manual, entitled "*Australian Geography, with the Shores of the Pacific and those of the Indian Ocean*," designed for the Use of Schools in New South Wales," 12mo, Sydney. Having invented a new propeller for steam-vessels on the principle of the boomerang, a strange missile weapon used by the Australian natives alone, he visited England in 1853, and delivered a lecture on the subject which excited much interest, and which he afterwards published with the title of "*Origin, History, and Description of the Boomerang Propeller*," a Lecture delivered at the United Service Institution," 8vo, London. In 1854 Sir Thomas Livingstone Mitchell was promoted to the military rank of colonel, and on the 5th October in the following year he died at his residence near Sydney, New South Wales. His death was justly regarded by all classes in the colony as a general bereavement, and his remains were honoured with a public funeral.

MOIR, DAVID MACBETH. This gentle, amiable, and talented poet and physician, was born at Musselburgh on the 5th of January, 1798. His father was a respectable citizen of that ancient burgh, and had a family of four children, of whom David was the second. After having learned the usual branches of education at one of the private town seminaries and the grammar-school of Musselburgh, he at the early age of thirteen commenced the study of his future profession by becoming apprentice to Dr. Stewart, a medical practitioner in Musselburgh, and soon began to evince that devotedness to the duties of the healing art which he continued till the close of his life. So early as 1812 David Moir wrote poetry. Not long after this he showed the bent of his ambition for authorship by sending two short prose essays to a little Haddington periodical called the *Cheap Magazine*, and their appearance in print was enough to confirm the tendency. It is gratifying to learn that in these youthful preludings he, like many who have attained a much higher elevation than himself, was fortunate in possessing not only an affectionate but a talented mother, to whom he read his early productions, and by whom his efforts were encouraged and his taste improved. And well was she rewarded for her care; for she lived till 1842, when her son's reputation was at its height, and strangers regarded her with respect as the mother of Delta.

After a four years' apprenticeship, and attendance upon the medical classes in Edinburgh, David Moir,

at the age of eighteen, obtained the diploma of surgeon. He was as yet young for business, and especially the laborious business of a country doctor; but in 1817 his mother was a widow, and no labour was too much for his filial affection. He therefore became partner of Dr. Brown of Musselburgh, who had an extensive practice, and toiled so earnestly in his profession, that his mother's difficulties were removed, and her home made comfortable. As his love of literature, instead of abating, continued to grow and strengthen, he was wont, when he returned home at nine or ten o'clock at night, after the harassing labours of the day, to light his candle in his bed-room, and continue his studies into the hours of morning. Under these circumstances he produced many excellent contributions both in prose and verse to *Constable's Edinburgh Magazine*. His regular mode of life and close application to business may in the meantime be learned from the fact, that from the year 1817 to 1828 he had not slept one night out of Musselburgh.

Soon after the establishment of *Blackwood's Magazine* Moir became one of its most frequent and popular contributors, and was known to its numerous readers under the name of Delta, from the Greek letter Δ, with which he was wont to subscribe his graver productions. From this signature he was wont to be called the Pyramid or the Triangle by his mirthful literary companions. But besides the tender lays and ballads with which he enriched the pages of the magazine, drolleries occasionally appeared of which he was the author, but to which he did not append the serious triangular *imprimatur*; and while the world laughed loudly and heartily at these effusions, they little wotted that their own sentimental Delta had penned them, or that all this was the production of a young surgeon in an obscure country town. Some of these were imitations of the most distinguished living poets; and to our thinking they were better caricature resemblances than even the *Rejected Addresses*, that obtained such a wide popularity. We would particularly instance Moir's "Eve of St. Jerry," "Billy Routing," and the "Ancient Waggonere," in which Scott, Wordsworth, and Coleridge were successively imitated, or rather mimicked, with most comic aggravations. We can remember as if it had been yesterday, the loud explosion of laughter from the Tweed to Caithness which the last-mentioned poem produced, when the readers of *Maga*, who had been wont to revere the "Ancient Mariner" as the most awe-inspiring of poetical productions, were suddenly shaken from their propriety at finding it, notes and all, travestied with such singular effect. In 1823 he had for his neighbour and acquaintance John Galt, who was then residing near Musselburgh; and so well was the literary reputation of Moir now established that the distinguished novelist, on being suddenly called off to America before he had finished the *Last of the Lairds*, intrusted the winding-up of the tale to Delta, which he accomplished to the author's satisfaction.

As his poetical productions in *Blackwood* had met with such success, Mr. Moir collected and published the best of them, with a few new additions, at the close of 1824, under the title of *Legend of Genevieve, with other Tales and Poems*. But the wide circulation of the magazine had already made them so well known that they had no longer the freshness of novelty, and therefore the reception of the volume, as compared with its merits, was but indifferent. At the same period he was employed in a prose work, from which perhaps he has derived a wider, if not so lasting a popularity as he has done from his poetical productions. This was the *Autobiography*

of *Mansie Wauch*, which he supplied in a series of chapters during three years to *Blackwood's Magazine*, and afterwards published as a separate work, with several additions and improvements. And what reader of this singular tale can fail to persuade himself that he has met with the veritable Mansie in flesh and blood? He is sure that he has seen the man somehow and somewhere, although whether as a flying tailor or not he cannot distinctly remember. Such is the great charm of the tale: the character and events are thrown off with such truthfulness, that the fun and fiction have all the worth of reality, or something very like it. Like Scott and Galt, midway between whom Delta at once took his place as a novelist, he collected events that had actually happened, and sayings that had been audibly uttered, and after improving them, grouping them, and throwing over them such a colouring of his own imagination as gave them harmonious uniformity as well as picturesque effect, he embodied them all in the doings and blunders of a half-silly, half-pawkie, vainglorious, and good warm-hearted creature, who lives, fights on, stumbles through the ups and downs of life, but still manfully does his duty, and finally attains comfort, substance, and worship as the most thriving of village tailors. The work was also admirably suited to the Scottish national character, which abounds in sly grave humour, rather than in the buoyant and more imaginative attribute of wit. Hence the favour with which *Mansie Wauch* was received, especially in Scotland, where it was best understood, and the permanent place which it has obtained in our northern literature of fiction as one of the choicest productions of its day; and he who holds an interview with Mansie departs, not a sadder, but a merrier, and withal a wiser man than before.

While Mr. Moir was thus so industrious in authorship, and deriving from it the reputation he so justly merited, he did not on that account suffer himself to be allured from the daily toils of his profession. How many young aspirants for literary fame, after reaping but a tithe of Delta's success, have flung their occupation to the winds, in the fond conceit that they had entered upon the track that would lead them to fame and fortune—and have found, when too late, that they had foregone the substance for a shadow, which at the best was not worth catching. And a strong proof it was of Moir's well-balanced, well-regulated mind, that instead of devoting all his energies to win his way into the front rank of poetry or novel-writing, he still persevered in his laborious, self-denying vocation, as if he had never compounded aught but a drug, or written anything higher than a prescription. Instead of making literature his crutch, it was his staff, or rather perhaps we should say his switch—a light, graceful thing, to flourish in very buoyancy of heart, and switch with it the hedges as he bounded onward in the path of duty. In this way he was better known among the good folks of Musselburgh as a painstaking skilful physician than a poet of high mark and standing; and his sphere of occupation kept steadily on the increase. This professional ability suggested to his friends in Edinburgh a change, by which his position in life, as well as the means of gratifying his literary tastes, would have been greatly increased. This was nothing more than to locate himself as a physician in the Scottish capital, where his medical reputation was as well established as his poetical excellence, and where troops of influential friends were ready to insure him an extensive practice. It was a tempting offer, more especially as no risk was involved in it. And yet it was rejected. Moir thought himself already so well circumstanced, that he would not hazard his already-con-

firmed contentment by seeking to make it better; and besides, his affections had so thoroughly entwined themselves with the families of that circle in which he had grown up, and among whom he moved and laboured, that he could not endure the thought of forsaking them, even though it should be for wealthier and more numerous patients. Besides, was he not now the healing as well as tuneless Apollo of Musselburgh; and, like Apollo, might say, though with a very slight variation, "Opiferque per urbem ditor?" Even genuine ambition, had there been no better motive, would have told him with the authoritative voice of Julius Cæsar, that it was better to be the first doctor in Musselburgh than the third or even the second in Edinburgh, to which rank he must inevitably be limited there. These were sound dissuaves, and Moir showed his good sense by estimating them at their full value, and acting accordingly. Such a man was worthy more than most men of the highest of domestic rewards, and this he obtained on the 8th of June, 1829, at Carham Church, Northumberland, where he received the hand of Miss Catherine E. Bell, of Leith—

"Catherine, whose holy constancy was proved
By all that deepest tries, and most endears."

After his happiness in the married state had been crowned by the birth of his first-born, a daughter, the life of Moir went on as usual, with the daily task and evening recreation, till 1831, when even those the least disposed to meddle with politics were obliged to take a side, and speak stoutly in its behalf. This was the year of the reform bill, and Moir, although a Conservative, was an earnest advocate for its passing, and officiated as secretary to the reform committee. It seems, however, to have been mainly in a religious spirit that he saw the need of a political reform, and he thus writes upon the subject to a friend:—"When a House of Commons could pass a detestable Catholic bill, against the constitution of the country and the petitions of nineteen-twentieths of its inhabitants, it was quite time that an end should be put to such a delusive mockery of representation." Towards the close of the same year he was presented with the freedom of his native town, and elected a member of its town-council. This year, also, he ventured upon a new field of authorship, by publishing his "*Outlines of the Ancient History of Medicine*, being a View of the Progress of the Healing Art among the Egyptians, Greeks, Romans, and Arabians." This work was intended to have been comprised in three parts; but the second and third, in which the history of the medical sciences was to be brought down from the dark ages to the middle of the last century, were never written. The first part of the work, which appeared under the title of the *Ancient History of Medicine*, was favourably received, both by the faculty and the critical press. In the following year another and still more urgent demand was made upon his pen on a subject connected also with his own profession. Europe will not soon forget that terrible visitation of cholera, which, after quivering like the bolt of heaven in its erratic progress, blasting and destroying wherever it happened to strike, fell at last upon Britain, and shook it to its deepest sea-girt foundations. Never was medical aid more needed, or the medical practitioner more imperilled; and never perhaps were the true chivalry and martyr-like devotedness of the healing art more severely tried and tested. On this occasion, while many physicians abandoned their duty in despair, or fled from it in terror, Moir was to be found daily and hourly at the bedsides of the infected, endeavouring to alleviate the sufferings of the sick by the resources

of his skill, or to comfort the dying with the consolations of religion. Even this was not enough; and therefore, after doing and daring the uttermost within his own round of occupation, he set himself to write his experience of the nature and treatment of the disease, and published a pamphlet, called *Practical Observations on Malignant Cholera*. At this time any suggestion by which the terrible pestilence could be retarded, was clutched as with a death-grasp; and no wonder, therefore, if a work on the subject by such a writer went through two editions in a few days. Soon after he produced his equally interesting *Proofs of the Contagion of Malignant Cholera*.

When the disease had abated, and the danger passed away, it was full time that Dr. Moir, never at any time a wanderer from home, should enjoy the recreation of travel. He decided upon a trip to London, not so much, however, for the purpose of a pleasure tour, as to visit his talented and beloved friend Galt, now shattered with paralysis, and hastening to decay, but with a mind shining as fiercely as ever through the crevices of the material ruin, and bearing up as bravely against the coming downfall. Moir also attended the meeting of the British Association, and made a visit to Cheltenham. Among the few intellectual giants with whom he came in contact during his short residence in London, was Coleridge, then living at Highgate; but like many others who have enjoyed the privilege of an interview with this marvellous poet, philosopher, and theologian, Moir came away delighted, he could not tell wherefore, and musing upon he knew not what. He had been in a land of dreams, and breathing an atmosphere of poppies, but the fresh air of reality brought him round in a few minutes. Indeed, the Archimagus of Highgate always found our Scotsmen the most stiff-necked of all his worshippers. Soon after his return from England, and in the beginning of 1833, Dr. Moir, from the retirement of his senior partner, became head of the business—a change which, while it increased his occupation, also lessened his opportunities for literary study and authorship. “Our business,” he writes to his friend Macnish, “has ramified itself so much in all directions of the compass, save the north, where we are bounded by the sea, that on an average I have sixteen or eighteen miles’ daily riding; nor can this be commenced before three or four hours of pedestrian exercise has been hurried through. I seldom get from horseback till five o’clock, and by half-past six I must be out to the evening rounds, which never terminate till after nine. Add to this the medical casualties occurring between sunset and sunrise, and you will see how much can be reasonably set down to the score of my leisure.” The wonder is, that with such a harassing amount of occupation, and almost total want of leisure, Moir should have continued to write so much as he did, or even that he should have written at all.

In February, 1838, affliction visited the happy home of Delta, and bereaved him of two children, the eldest four and a half years old, the other only fifteen months. The first of these, Charles Bell, who named himself in childish frolic, Casa Wappy, is well known to the world, and especially to many a mother’s tender heart, by the touching poetical commemoration of his grieving father, who lamented him in an elegy which he never surpassed, or perhaps even equalled. Who can read unmoved the following stanzas?—

“Do what I may, go where I will,
Thou meet’st my sight;
There dost thou glide before me still—
A form of light!

I feel thy breath upon my cheek,
I see thee smile, I hear thee speak,
Till, O! my heart is like to break,
Casa Wappy!

* * * * *
The nursery shows thy pictur’d wall;
Thy bat, thy bow,
Thy cloak and bonnet, club and ball;
But where art thou?
A corner holds thine empty chair;
Thy playthings idly scattered there,
But speak to us of our despair,
Casa Wappy!”

Of his five children he could still remember that three were left to him, and he consoled himself with the thought; but only a year after he was bereaved of a third child, David Macbeth Moir, his little namesake. “Three blessed beings,” he thus exclaims—

“Three blessed beings! ye are now
Where pangs and partings are unknown,
Where glory girds each sainted brow,
And golden harps surround the throne:
O! to have hail’d that blissful sight,
Unto the angels only given,
When thy two brothers, robed in light,
Embraced thee at the gates of heaven!”

In this manner Delta was wont to express and chronicle the chief feelings of his own private life, and at first they were only circulated among his friends. But the approbation they called forth from Wordsworth, Tennyson, and Montgomery among the poets, from Jeffrey and Lockhart among the critics, and from Dickens, Warren, and Ferrier among our eminent writers of fiction, and their urgent request that these productions should be given to the world, was a call too powerful to be refused, and he published them accordingly in 1843, under the title of *Domestic Verses*.

Moir, now at no more than the age of confirmed manhood, when health is strongest and hope often at the brightest, bade fair, from his firm constitution and temperate habits, to be destined for a long life of usefulness, that to the eyes of his friends loomed in bright perspective. But even at this period a series of accidents commenced by which his term was to be hastily drawn to a close. In 1844, from sitting in wet clothes a whole night by the bedside of a patient, he caught a severe internal inflammation, from the effects of which his constitution never fully recovered. Two years after, while visiting Borthwick Castle with a small party of friends in a phaeton, the horse took fright, ran off, and upset the carriage; the whole party, who were thrown out, escaped with little hurt, except Dr. Moir, whose hip-joint was so injured by the fall that it made him lame for life. As his medical duties still continued, he was obliged on this account to remit his literary avocations, as the evening usually found him fit for nothing but his bed. And truly it was no wonder, for on an average he travelled about 220 miles per week, independently of his numerous professional visits to short distances on foot. With all this, and diminished bodily powers, he was still able, however, to give attendance to those literary and scientific meetings at which his name was in high request; and his last exertion of this kind, in which he delivered six lectures at the Philosophical Institution of Edinburgh in 1851, on the poetical literature of the past half century, will long be affectionately remembered by the lecture-loving inhabitants of our capital. These lectures too, be it remembered, were composed after the hours of ten and eleven at night, when over-toiled mortals like himself had contentedly retired to rest. At length, on the 22d of June, 1851, while dismounting from his horse, a work of difficulty in his case on account of his lameness, he sus-

tained so severe a wrench that pain and debility followed, so that on the 1st of July he set off on a jaunt to Dumfries, in the hope that change of scene and cessation from labour might restore him. It was a vain hope, for at Dumfries he rapidly sank, and expired on the morning of the 6th of July. His last hours were spent in Christian peace and hope, and he died in the assurance that his solemn petition was answered, "May the Lord my God not separate between my soul and my body till he has made a final and eternal separation between my soul and sin."

In consequence of the request of the inhabitants of Musselburgh, the funeral of Dr. Moir, which took place on the 10th of July, was a public one; and it was attended not only by the provost, magistrates, and town-council of the burgh, and the kirk-session of Inveresk, but the chief professors, clergymen, and literati of Edinburgh and its neighbourhood. A public monument has been erected to his memory in the churchyard of Inveresk, where his ashes repose.

MONCREIFF, SIR JAMES WELLWOOD, Bart., of Tullibole. This eminent judge, one of those distinguished ornaments of the Scottish bar and bench for which the present century has been so remarkable, but who have successively disappeared and left a void which will not easily be filled, was the second son of the Rev. Sir Henry Moncreiff Wellwood, one of the ministers of St. Cuthbert's, Edinburgh. His mother was Susan Robertson, eldest daughter of James Robertson Barclay, of Keavil, in Fifeshire. He was born in the second-charge manse of St. Cuthbert's, Edinburgh, on the 13th of September, 1776. As he was one of a family of five sons and two daughters, and as the hereditary estate of the ancient family of the Moncreiffs had lapsed into the possession of a younger branch nearly two centuries previous, James, the subject of the present memoir, was destined to a life of active industry, for which purpose his education was commenced at the high-school of Edinburgh, and afterwards continued at the university of Glasgow. At the latter institution he was so fortunate as to obtain one of its exhibitions to Baliol College, Oxford—an appointment which secured to him for ten years a complete course of literary and professional training at the same seminary which has produced, for many generations, the master-spirits and leading intellects of Europe. Sir James, however, found that, even in Oxford, the attainment of this high distinction depended more upon a diligent course of self-training than the parental care of his new *alma mater*, whose monastic institutes, worn out with old age, could no longer be screwed up to the full coercive pitch. That happy reformation had not yet commenced under which Oxford has assumed a new life, and commenced a fresh history, that promises to be more glorious than its old. In spite, however, of the prevalent looseness which at that time characterized the discipline of these colleges, and the facility with which their pains and penalties could be eluded or confronted, he became an accomplished scholar, and was enabled to prepare for active exercise those high intellectual qualities for which he was so distinguished in the course of his future career.

As Mr. Moncreiff had selected the law for his profession, and the Scottish bar for his place of occupation, his studies at Oxford had been chiefly directed to this effect; and on the 26th of January, 1799, he was admitted a member of the faculty of advocates at Edinburgh. At first his progress as a barrister was slow, and his prospect of advancement unpromising; but for this, the solid, substantial character

of his mind, which required longer time for full development, was a sufficient excuse. A profound reflective lawyer seldom starts into full maturity at the age of twenty-three, or even gives large promise of his future excellence. But a still greater obstacle to early success might be found in Mr. Moncreiff's politics, which were by some years in advance of the period; they were those uncompromising independent principles which he had learned, from the example of his venerated father, to cherish and avow, in spite of Tory ascendancy and government patronage; and in this way Mr. Moncreiff, instead of having the tide at its height to bear him onward, was obliged to confront it in its rise, and when it was set full against his progress. Like his illustrious contemporary Jeffrey, he adopted the losing side in politics when there was least hope of its obtaining the ascendancy.¹ But both were finally no losers by their disinterestedness. In the meantime Mr. Moncreiff held onward perseveringly in his course, and the first distinguished token of his growing success occurred on the 7th of February, 1807, when he was appointed sheriff of the united counties of Clackmannan and Kinross. This fortunate rise, by which his income was doubled, and a fresh starting-point attained, occurred during the short-lived administration of Lord Grenville. In the following year (1808) he married Ann, daughter of Captain George Robertson, of the royal navy.

The career of an advocate at the bar is not an eventful one: it is simply a history of pleadings and their results, with which none but the parties concerned can be expected to feel any interest. On this account it is enough to state that every year increased Mr. Moncreiff's professional reputation; and at a period when the most illustrious of our Scottish pleaders were at the full height of their fame (Jeffrey, Cranstoun, Cockburn, Clerk), he held a rank inferior to none. Some of them, indeed, might excel him in ready or persuasive eloquence; but this inferiority was more than counterbalanced by the depth and accuracy of his legal knowledge, and his power of turning it to the best account. In this way his professional character is thus summed up by one of that illustrious confraternity who knew and could well appreciate his merits:—"Though a good thinker, not quick, but sound, he was a still better arguer. His reasoning powers, especially as they were chiefly seen concentrated on law, were of the very highest order. These, and his great legal knowledge, made him the best working counsel in court. The intensity of his energy arose from that of his conscientiousness. Everything was a matter of duty with him, and therefore he gave his whole soul to it. Jeffrey called him the whole duty of man. Simple, indifferent, and passive when unyoked, give him anything professional or public to perform, and he fell upon it with a fervour which made his enemies tremble, and his friends doubt if it was the same man. One of his cures for a headache was to sit down and clear up a deep legal question. With none, originally, of the faculties of speaking which seem a part of some men's nature, zeal, practice, and the constant possession of good matter, gave him all the oratory that

¹ His early adoption and avowal of Whig politics is thus commemorated in Cockburn's *Life of Lord Jeffrey*:—"The public meeting in 1795, for attending which Henry Erskine was turned out of the deanship, was held in the circus, which their inexperience at that time of such assemblages had made them neglect to take any means to light, and Erskine was obliged to begin his speech in the dark. A lad, however, struggled through the crowd with a dirty tallow-candle in his hand, which he held up during the rest of the address before the orator's face. Many shouts honoured the unknown torch-bearer. This lad was James Moncreiff, then about sixteen."

he required. He could in words unravel any argument, however abstruse, or disentangle any facts, however complicated, or impress any audience with the simple and serious emotions with which he dealt. And for this purpose his style, both written and spoken, was excellent—plain, clear, condensed, and nervous." In another sketch, by a different writer, we have a view of all these intellectual equipments in full vigorous action, at the time when Moncreiff was in the prime of his manhood as well as professional reputation: "He has a countenance full of the expression of quick-sightedness and logical power, and his voice and manner of delivering himself are such as to add much to this the natural language of his countenance. He speaks in a firm, harsh tone; and his phraseology aspires to no merit beyond that of closeness and precision. And yet, although entirely without display of imagination, and though apparently scornful to excess of every merely ornamental part of the rhetorical art, it is singular that Mr. Moncreiff should be not only a fervid and animated speaker, but infinitely more keen and fervid throughout the whole tenor of his discourse, and more given to assist his words by violence of gesture, than any of the more imaginative speakers whom I have already endeavoured to describe. When he addresses a jury, he does not seem ever to think of attacking their feelings; but he is determined and resolved that he will omit no exertion which may enable him to get the command over their reason. He plants himself before them in an attitude of open defiance: he takes it for granted that they are against him, and he must and will subdue them to his power. Wherever there is room to lay a finger, he fixes a grappling-iron, and continues to tear and tug at everything that opposes him, so that incredulity is glad to purchase repose by assenting to all he demands. . . . His choleric demeanour gives a zest to the dryness of the discussions in which he is commonly to be found engaged. His unmusical voice has so much nerve and vigour in its discords, that after hearing it on several occasions I began to relish the grating effect it produces upon the tympanum."¹

From these two delineations, although the latter is somewhat overcharged, a distinct idea may be formed of James Moncreiff in his professional character and bearing. These also had won their way to such just estimation, that on the 22d of November, 1826, he was elected dean of faculty, although the senior, and in some respects superior, claims of Jeffrey to the office were against him. But in Jeffrey himself, with whom he had fought many a hard legal tournament, he found that best of all friends—a generous, open-hearted antagonist—and the great critic and eloquent barrister not only maintained Mr. Moncreiff's claims as superior to his own, but seconded his nomination. While he held this office, the dean showed his upright disinterested love of justice in a case where many in similar circumstances would have quailed. This was in reference to the West Port murders, and the trial of their infamous perpetrators, Burke and Hare. So deep was the popular abhorrence over the whole of England and Scotland on the detection of this hideous system of Thuggism, and so overwhelming was the outcry for justice—for vengeance—that it was thought no advocate could be so hardy as to plead the cause of these assassins, who were already tried and doomed by universal acclamation. It was then that several leading advocates of the Scottish bar, with Mr. Moncreiff as dean at their head, stepped forward in defence of truth and right against the universal cry,

and while the storm was at the wildest; and through their exertions the two malefactors obtained a fair dispassionate trial, in which one of them, who turned king's evidence, was absolved, when both might otherwise have been torn to pieces without a hearing. The exertions of the dean of faculty in this thankless and most revolting case—his earnestness to vindicate the claims of justice, whether to acquit or condemn, though a whole world might be arrayed against them—and the discriminating talent with which he sifted the evidence of the whole perplexing affair, until it stood out in all its distinct reality—were long afterwards remembered with grateful commendation, not only by his professional brethren, whom the example honoured and encouraged, but the public at large, whose hasty judgments it restrained and rebuked.

By the death of his revered father, on the 7th of August, 1827, Mr. Moncreiff succeeded to the family baronetcy, under the title of Sir James Wellwood Moncreiff, of Tullibole; his elder brother, who was king's advocate in the Admiralty Court of Malta, having died unmarried in 1813. In 1829 Sir James was appointed a lord of session, in consequence of a vacancy in the bench, occasioned by the death of Lord Alloway. This appointment was the more honourable to Sir James, that it proceeded, not from his own party, but his political opponents. They had no occasion to regret their choice, for as a judge he equalled, or perhaps even surpassed, the reputation he had won as a barrister. "In the civil court," it is stated in a short notice of his life, "his judgments were admirable for learning and sagacity; and on the bench of the criminal court his dispassionate weighing of evidence, his sound appreciation of the rules of law, the impressive solemnity of his charges on great occasions, carried a conviction, and gained a confidence, which the people of Scotland have not always yielded to their judges." Before his elevation to the bench he had also risen to high public mark and importance, independently of his professional displays, by his speeches at public meetings, on affairs both political and ecclesiastical. This was especially the case at the great meeting held in Edinburgh in favour of Catholic emancipation; and when Dr. Chalmers and Lord Jeffrey delivered their eloquent and memorable speeches on that important occasion, the first resolution had been previously moved and enforced with great power by Sir James Moncreiff. It was, however, as a member of the General Assembly of the Church of Scotland that his great talents for investigation and debate, combined with his well-known integrity, were chiefly valued; so that on several important occasions he was called to lead the deliberations of that august body.

So close a connection with the church, and such a hearty devotedness to its interests, which marked the professional career of Lord Moncreiff, is not to be wondered at when we remember his clerical descent through not less than seven generations! Like his father, also, he adhered to that party in the church known by the title of Evangelical, in opposition to the Moderate side, which might be called the Toryism of the Scottish Kirk. While he held the office of a ruling elder, his attendance at church courts was frequent and his aid effectual, and he had the satisfaction to witness the rise, from year to year, of those principles of religious doctrine and ecclesiastical polity with which he was connected. At length, when his party had acquired such strength as to bring their controversy to a decisive issue upon the great question of patronage, he was called, in 1832, to give evidence before a select committee of the House of Commons, which was appointed to

¹ *Peter's Letters to his Kingsfolk.*

inquire into the origin and exercise of church-patronage in Scotland. His lordship's answers to the searching questions which were put to him on his examination, the flood of light which he threw upon this difficult subject, and the simple, earnest, impressive language and manner in which his testimony was delivered, were long afterwards remembered. For a considerable time before the Disruption he had retired from the conflict in consequence of his judicial position; and when at last it occurred, in 1843, his attention was too mournfully engrossed by the death of his lady, which happened at the same period, to allow him to join in the events of that great movement. After the Disruption, although he ceased to be an elder, he continued to hold church membership in the Free Church of Scotland, with whose leading principles his whole course of life had been identified.

On nearing the venerable age of seventy-five, Lord Moncreiff began to yield to the decay of nature; and for several weeks before he died the state of his health was such, that although the physicians held out hopes of his recovery, he felt assured that his end was at hand—a result which he contemplated without dismay, and for which he prepared with Christian resignation and confidence. His death occurred at his house in Moray Place, Edinburgh, on the afternoon of March 30, 1851, and his remains were interred in the Dean Cemetery, within a few feet of the grave of his old friend Lord Jeffrey. His character is thus briefly and emphatically summed up by Lord Cockburn: "I am not aware how his moral nature could have been improved. A truer friend, a more upright judge, or a more affectionate man, could not be."

The family of Lord Moncreiff consists of five sons and three daughters. Of these, the eldest son, Sir Henry Wellwood Moncreiff, is minister of the Free West Church of St. Cuthbert's, Edinburgh; the second, who followed his father's profession, is now dean of faculty of the Scottish advocates.

MONRO, ALEXANDER, M.D., usually called *Secundus*, to distinguish him from his father, an eminent medical writer and teacher. Before entering upon the memoirs of this individual, it is necessary to give some account of his father, Dr. Monro, *Primus*, the founder of the medical school of Edinburgh, who, having been born in London, is not precisely entitled to appear in this work under a separate head.

Dr. Monro, *Primus*, was born in London, September 19, 1697. He was the son of Mr. John Monro, a surgeon in the army of King William, descended from the family of Monro of Milton, in the north of Scotland. His mother was of the family of Forbes of Culloden. Having retired from the army, Mr. Monro settled in Edinburgh about the beginning of the eighteenth century, and entering the College of Surgeons, soon acquired considerable practice. His favourite employment, however, was to superintend the education of his son, whose talents he perceived at an early period. Though medical and anatomical chairs at that time existed in the university of Edinburgh, they were quite inefficient, and hence it was found necessary to send young Monro elsewhere for the completion of his education. He went successively to London, Paris, and Leyden, and became the attentive pupil of the great men who then taught at those universities, among whom were Cheselden, Hawksby, Chowel, Bouquet, Thibaut, and Boerhaave. Not content with listening to the instructions of these teachers, he studied assiduously by himself, especially in the department of anatomy.

While attending Cheselden in London, he made numerous anatomical preparations, which he sent home; and while here, even laid the foundation of his important work on the bones, a sketch of which he read before a society of young surgeons and physicians, of which he had been elected a member. Before his return his father had presented several of his preparations to the college, so that his skill was already well known. The titular professor of anatomy to the College of Surgeons had even formed the resolution of relinquishing his appointment in favour of this promising young anatomist, who, he thought, would be able to convert it into a useful profession. Accordingly, on his arrival in Edinburgh, in 1719, when only twenty-two years of age, he was nominated to this dignity. Early in the ensuing year he commenced the first regular course of anatomical and chirological lectures and demonstrations which were ever delivered in that city. From his abilities and zeal, and the preparations with which he illustrated his discourses, success could hardly fail to attend his labours. It could not, however, be expected that an anatomical and surgical course alone, however valuable, or a single professor, however great his abilities, could be sufficient to raise the fame of a medical school which had to combat many rival seminaries of deserved eminence. It became, therefore, a matter of the utmost consequence to obtain such associates as could second and support his labours. His father, to whose zeal for the establishment of a medical school in Edinburgh much of his son's success is to be attributed, prevailed on Dr. Alston, then king's botanist for Scotland, to begin a course of lectures on the *materia medica*. He also took an expedient for improving his son's mode of lecturing. Without the young teacher's knowledge he invited the president and fellows of the College of Physicians and the whole company of surgeons to honour the first day's lecture with their presence. This unexpected audience threw the doctor into such confusion that he forgot the words of the discourse which he had written and committed to memory. Having left his papers at home, he was at a loss for a little time what to do; but, with much presence of mind, he immediately began to show some of the anatomical preparations in order to gain time for recollection, and very soon resolved not to attempt to repeat the discourse which he had prepared, but to express himself in such language as should occur to him from the subject, which he was confident that he understood. The experiment succeeded; he delivered himself well, and gained great applause as a good and ready speaker. Thus discovering his own strength, he resolved henceforth never to recite any written discourse in teaching, and acquired a free and elegant style of delivering lectures.

The want of lectures on other branches, which still remained as an obstacle to the creation of a medical school, was soon altogether overcome by the zeal of the elder Monro, through whose influence his son and Dr. Alston were put upon the college establishment, together with co-operative lectureships, undertaken by Drs. Sinclair, Rutherford, and Plumer. Such was the origin of the medical school of Edinburgh, which for more than a century has been one of the most eminent and most frequented in Europe. The system was completed in the course of a few years by the establishment of the Royal Infirmary at Edinburgh, which was chiefly urged forward by Dr. Monro, with a view to the advantage of his pupils, and by George Drummond, the lord-provost of the city. In this institution Dr. Monro commenced clinical lectures on the surgical, and Rutherford a similar course on the medical, cases. The former,

in his various capacities of physician, lecturer, and manager, took an active part in the whole business of the infirmary. He personally attended the opening of every body; and he not only dictated to the students an accurate report of the dissection, but, with nice discrimination, contrasted the diseased and sound state of every organ. Thus, in his own person, he afforded to the students a conspicuous example of the advantages of early anatomical pursuits as the happiest foundation for a medical superstructure. His being at once engaged in two departments, the anatomical theatre and the clinical chair, furnished him with opportunities for experiment both on the dead and living body, and placed him in the most favourable situation for the improvement of medicine; and from these opportunities he derived every possible advantage which they could afford.

None of the professors connected with medicine in the Edinburgh university contributed so much to the formation of the school as Dr. Monro, who was indefatigable in the labours of his office, and in the cultivation of his art, and soon made himself known to the professional world by a variety of ingenious and valuable publications. During a period of nearly forty years he continued, without any interruption, to deliver a course of lectures, extending from the end of October to the beginning of May; and so great was the reputation which he acquired, that students flocked to him from the most distant parts of the kingdom. His first and principal publication was his "*Osteology*, or Treatise on the Anatomy of the Bones," which appeared in 1726, when he was as yet under thirty years of age. This treatise, though intended originally for the use of his pupils, speedily became popular among the faculty in general, and was translated into most of the languages of Europe. The French edition, in folio, published by M. Sue, demonstrator of sculpture to the Royal Academy of Paris, was adorned with masterly engravings. In the later editions Dr. Monro added a concise "*Neurology*," or description of the nerves, and a very accurate account of the lacteal system and thoracic duct.

In every society at Edinburgh for the improvement of arts or of letters, Dr. Monro was one of the most distinguished ornaments. He was a member of the Colleges of Physicians and Surgeons; of the Medical Society; of the Philosophical Society; of the Select Society for Questions in Morality and Politics; and of the Society for Promoting Arts, Sciences, and Manufactures in Scotland. He was also a member of several foreign societies, to which he had been recommended by his great reputation. It was to his zeal and activity that the world was chiefly indebted for the six volumes of *Medical Essays and Observations*, by a society at Edinburgh, the first of which appeared in 1732. Dr. Monro acted as editor of this work, and contributed to it many valuable papers on anatomical, physiological, and practical subjects; the most elaborate of which was an "Essay on the Nutrition of the Fœtus," in three dissertations. On this society being afterwards revived under a different title, Dr. Monro again took an active part in its proceedings as one of the vice-presidents, and was a liberal contributor to its publications, of which three volumes appeared, under the title of *Essays, Physical and Literary*. His last publication was *An Account of the Success of Inoculation in Scotland*, written originally as an answer to some inquiries addressed to him from the committee of the faculty of physicians at Paris, appointed to investigate the merits of the practice. It was afterwards published at the request of several of his friends, and contributed to extend the practice in

Scotland. Besides the works which he published, he left several manuscripts, written at different times, of which the following are the principal: "A History of Anatomical Writers"—"An Encheiræsis Anatomica"—"Heads of many of his Lectures"—"A Treatise on Wounds and Tumours"—"A Treatise on Comparative Anatomy"—and an "Oration De Cuticula." The last two were printed in an edition of his whole works, in one volume, 4to, published by his son, Dr. Alexander Monro, 1781.

The advance of age and infirmity induced Dr. Monro to resign his chair, in 1759, in favour of his son; but he continued almost to the close of his life to perform his duties in the Royal Infirmary. Several of his latter years were embittered by a severe disease, a fungous ulcer in the bladder and rectum; but he bore his distresses with great patience and resignation, and at last died in perfect calmness, July 10, 1767, in the seventieth year of his age.

Dr. Monro had in early life married Miss Isabella Macdonald, daughter of Sir Donald Macdonald, of Sleat, by whom he had eight children, four of whom, three sons and a daughter, reached maturity. Two of his sons became distinguished physicians—namely, Dr. Donald Monro, who attained an eminent practice in London, and became the author of several valuable treatises: an *Essay on Dropsy*, 1765; on the *Diseases of Military Hospitals*, 1764; on *Mineral Waters*, 1771; on *Preserving the Health of Soldiers*, &c.; and died in 1802: and Dr. Alexander Monro, *secundus*, of whose life we shall proceed to give an extended notice.

DR. MONRO, *secundus*, was the youngest son of Dr. Alexander Monro, *primus*, whose life has just been commemorated, and was born at Edinburgh on the 20th of March, 1733. He learned the first rudiments of classical education under the tuition of Mr. Muddell, then an eminent teacher of languages at Edinburgh. At the university of his native city Dr. Monro went through the ordinary course of philosophy, preparatory to his medical studies. During that course he was a pupil of the celebrated MacLaurin for mathematics—of Sir John Pringle for ethics—and of Dr. Matthew Stewart for experimental philosophy. About the eighteenth year of his age he entered on his medical studies under his illustrious father, who, from his lectures and writings, had by that time justly obtained very great celebrity. Young Monro soon became a very useful assistant to his father in the dissecting-room, and was highly respected for his early acquirements among the companions of his studies; several of whom, Dr. Hugh Smith of London, Dr. Matthew Dobson of Liverpool, Dr. William Farr of Plymouth, and some others, were afterwards justly celebrated in the annals of medicine by their writings.

Dr. Monro, after completing the academical course of medical study at Edinburgh, under Drs. Rutherford, Plumer, Sinclair, Alston, and other eminent men, obtained the degree of Doctor of Medicine on the 17th of October, 1755. On that occasion he published and defended an inaugural dissertation, *De Testibus et Semine in Variis Animalibus*. That dissertation, which manifests his accurate knowledge of minute anatomy, was illustrated by five capital engravings, each plate containing several different figures; and it laid the foundation of the important discoveries which he afterwards made with regard to the lymphatic system. The public testimony which Dr. Monro thus gave of his anatomical knowledge, and the reputation which he had acquired both as a demonstrator and lecturer, when occasionally assisting his father, naturally attracted the attention of the patrons of the university of Edinburgh; and

to secure to the seminary under their care a young man of such distinguished abilities, he was, on the 12th of July, 1755, when he had but just entered on the twenty-third year of his age, admitted into the university as professor of anatomy and surgery, in conjunction with his father; but that father, still in the vigour of life, and fully able to execute every part of the duties of his office, did not require the immediate assistance of his son. Accordingly, young Monro, after finishing his academical studies at home, resolved to prosecute them abroad. With this intention he visited both London and Paris, where he had an opportunity of being a pupil of the most eminent professors in these cities. But his foreign studies were principally prosecuted at the university of Berlin. There he had every opportunity of improving himself under the celebrated professor Meckell, who was at that time justly esteemed one of the first anatomical teachers in Europe. During his residence in Berlin, he was not only a pupil at the prelections of Meckell, but lived in his house, and thus enjoyed the benefit of his instructions both in public and private. That from these sources his natural and acquired abilities were much improved may readily be supposed; and he himself was so fully sensible of what he owed to so eminent a preceptor as Meckell, that during the long period in which he taught anatomy at Edinburgh, he allowed not a single year to pass without repeatedly expressing his gratitude for the instruction he had received under the roof of this justly celebrated professor.

From Berlin Dr. Monro returned to Edinburgh in summer, 1758. Immediately upon his return he was admitted a licentiate of the Royal College of Physicians, and entered upon actual practice. As soon as the regulations of the college would permit he was raised to the rank of fellowship, and took his seat as a member of that respectable body on the 1st of May, 1759. After that date, for more than half a century, he continued to exert himself with unwearied activity, not only as a professor and practitioner, but as an improver of the healing art, and of our knowledge of the philosophy and structure of the animal frame. This will abundantly appear from a short review of the different publications with which he has enriched the treasury of medical philosophy, conveying important instruction both to his contemporaries and to the latest posterity.

Very soon after he settled in Edinburgh, he not only became a colleague of his father in the college, but succeeded him also as secretary to the Philosophical Society of Edinburgh. In the volumes published by the society Dr. Monro first appeared as an author. His first publication was printed in the first volume of a well-known and justly celebrated work, entitled *Essays and Observations, Physical and Literary*, read before a society in Edinburgh, and published by them. This volume of their memoirs appeared in 1754, and contains two anatomical essays by Alexander Monro, student of medicine in the university of Edinburgh; from both of which he obtained very great credit as an intelligent and industrious young anatomist. In their second volume, published in 1756, are contained also two articles from his pen; the "Dissection of a Monster," and the "History of a Genuine Volvulus of the Intestines;" both of which served materially to improve the philosophy of medicine, and to do credit to the author. His next three publications were more of a controversial nature than calculated to extend our knowledge of the structure or philosophy of the human body. From a very early period, as appears from his inaugural dissertation, he had adopted the idea that the valvular lymphatics over the whole of

the animal body were one general system of absorbents: and with the view of promulgating this doctrine, he published at Berlin, in 1758, a short treatise, *De Venis Lymphaticis Valvulosis*. The grand idea, however, which this short treatise contained, was afterwards claimed by Dr. William Hunter of London; and this claim drew from the pen of Dr. Monro two other publications—*Observations, Anatomical and Physiological, wherein Dr. Hunter's Claim to some Discoveries is Examined*; and, *Answer to the Notes on the Postscript to Observations, Anatomical and Physiological*. Here the only difference between these two eminent men was not with regard to the extent or use of the valvular lymphatics, but with regard to the merit of being the discoverer of their use. A judgment on that controversy is now of very little importance; and perhaps neither of them is justly entitled to the merit of the discovery. For, prior to either, that the lymphatics were a general system had been explicitly stated by the illustrious Hoffman. But that the anatomical labours, both of Monro and Hunter, independently of any information which the one derived from the other, tended very much to extend our knowledge of the lymphatic system, will not be denied by any intelligent reader.

In the year 1771 the Philosophical Society of Edinburgh, which Dr. Monro tended not a little to support, by fulfilling all the duties of an intelligent and active secretary, published the third and last volume of their *Essays and Observations, Physical and Literary*. This volume, among many other valuable essays, is enriched by a production of Dr. Monro, entitled "An Attempt to Determine by Experiments, how far some of the most Powerful Medicines, Opium, Ardent Spirits, and Essential Oils, affect Animals, by acting on those Nerves to which they are primarily applied, and thereby bringing the rest of the Nervous System into suffectance, by what is called Sympathy of Nerves; and how far these Medicines affect Animals after being taken in by their Absorbent Veins, and mixed and conveyed with their Blood in the course of Circulation; with Physiological and Practical Remarks." This elaborate dissertation, highly interesting in the practice of medicine, afforded ample proofs of the genius, the judgment, and the industry of the author.

In 1783 Dr. Monro published a large folio volume, entitled *Observations on the Structure and Functions of the Nervous System*. This volume, which was illustrated by numerous engravings, was soon afterwards translated into German and into other modern European languages; and, high as his reputation was before, it tended both to support and to increase his fame. The same consequences also resulted from another folio volume which he published in the year 1785, entitled "*The Structure and Physiology of Fishes*, explained and compared with those of Man and other Animals, illustrated with Figures." In 1788 he published a third folio volume, entitled *A Description of all the Bursa Mucosa of the Human Body*; their Structure explained, and compared with that of the Capsular Ligaments of the Joints; and of those Sacs which line the Cavities of the Thorax and Abdomen; with Remarks on the Accidents and Diseases which affect these several Sacs, and on the Operations necessary for their Cure." For these three works the folio form was necessary, on account of the size of the plates with which they were illustrated, and which had been engraved at a very great expense. Although all these three folios were presented to the learned world within the short space of five years, yet they may be considered as the scientific fruits of the best part of Dr. Monro's life. For,

although a large portion of his time was necessarily occupied in teaching anatomy to numerous classes, and in extensive practice as a physician, yet, amidst all his important avocations, he prosecuted with unwearied assiduity the extension of discovery, and neglected no opportunity of increasing our knowledge of the philosophy of the human body. Of his success in these interesting pursuits, the three works now mentioned will transmit incontrovertible evidence to the latest posterity.

Dr. Monro, *primus*, as already noticed, had officiated for more than thirty years as secretary to a medical society in Edinburgh, which was formed of the most eminent physicians of the city at that time. During this period he had published in their name, six volumes of *Medical Essays*, which had obtained the approbation of the most eminent physicians in every country of Europe, insomuch that the illustrious Haller had represented it as a book *quem nemo carere potest*. But about the year 1750 a proposal was made to unite the physicians and philosophers of Edinburgh into one society. This proposal was strenuously supported by Henry Home, afterwards Lord Kames, and Mr. David Hume. The union was accordingly accomplished; and in place of the Medical they assumed the name of the Philosophical Society of Edinburgh. Dr. Monro, *primus*, still continued to be one of their secretaries, and had conjoined with him Mr. David Hume, the historian, for the philosophical department. This society published three volumes of *Essays and Observations, Physical and Literary*. The first volume, as has already been observed, contains some papers written by Alexander Monro, *secundus*, when a student of medicine. But after his return from his studies on the Continent, and after his conjunction with his father in the professorship of anatomy, he was also conjoined with him as secretary to the Philosophical Society of Edinburgh; and although Mr. Hume still retained the name of the Philosophical secretary, yet Dr. Monro, *secundus*, may justly be considered as the editor of the two last volumes. With the venerable Lord Kames as their president, and Dr. Monro, *secundus*, as their acting secretary (for Mr. Hume not long after his appointment left Edinburgh, to act in a diplomatic character in France), the Philosophical Society of Edinburgh had regular meetings. The physicians and philosophers who were then the greatest ornaments of Edinburgh—Lord Kames, Sir George Clerk, Mr. John Clerk, Drs. Cullen, Home, Hope, Black, Young, Monro, and many others—constituted the strength of the association; and the *Essays and Observations, Physical and Literary*, which they published to the world, will ever hold a distinguished place in marking the progress of science. The third and last volume published by the Philosophical Society of Edinburgh, in 1771, contains several papers from the pen of Dr. Monro, *secundus*. Besides the interesting experiments on opium, ardent spirits, and essential oils, of which mention has already been made, it contains important observations, communicated by him, on “Polypus in the Pharynx and Œsophagus,” and on the use of mercury in convulsive diseases. Soon after the publication of this third volume, a plan was projected for putting the Philosophical Society of Edinburgh upon a still more respectable footing and extensive scale, and of comprehending not only medical and physical science, but every species of literary and philological discussions. This extension was particularly enforced by Dr. Robertson, then principal, and Mr. Dalzell, then professor of Greek, in the university of Edinburgh. The negotiation terminated in the Philosophical Society as a body, with the addition

of many other eminent scholars, being incorporated by royal charter in the year 1782, under the title of the Royal Society of Edinburgh.

On the establishment of the Royal Society Dr. Monro, whose time was much occupied with extensive practice in medicine, declined any longer officiating as secretary; but he continued not only to be one of their councillors, but to be an active and useful fellow of the Royal Society of Edinburgh; and he enriched their *Transactions* with several valuable communications, particularly with the description of a human male monster; with an elaborate series of experiments on animal electricity or galvanism, which, from the discoveries of Galvani, professor of anatomy of Bologna, has engaged the attention of almost every philosopher in Europe; and with observations on the muscles, particularly on the effects of their oblique fibres.

The last publication with which Dr. Monro enriched medical science was a quarto volume, consisting of three treatises on the “Brain;” the “Eye,” and the “Ear,” published at Edinburgh in the year 1797. And although these organs had before been examined with the utmost attention by anatomists of the first eminence, yet, from careful examination, he made no inconsiderable addition to our knowledge both of the structure and functions of these important organs.

Dr. Monro's talents extended his fame over all Europe, and he had the honour of being admitted a member of the most celebrated medical institutions, particularly of the royal academies of Paris, Madrid, Berlin, Moscow, and other learned societies. His eminence as an author was not superior to his fame as a teacher of medicine. For a long series of years his class-room was attended by crowded audiences; and no hearer of real discernment could listen to him without being both pleased and instructed by his prelections. He began to teach medicine immediately upon his return from the Continent at the beginning of the winter session 1758–59. During that winter his father, Dr. Monro, *primus*, gave the introductory lectures and a very few others. But by much the greater part of the course was given by the young professor; and for forty succeeding years he performed the arduous duties of the anatomical chair without any assistant. No teacher could attend to the business of his chair with more assiduity. Indeed, during the whole of that period he made it an invariable rule to postpone to his academical duties every other business that could possibly admit of delay.

While we thus state Dr. Monro's character as an author and a teacher, his worth as a man and a citizen must not be forgotten. With his brethren of the profession and his colleagues in the university he lived on the most amicable terms. He seems to have had constantly in his mind the admirable observation of Seneca: “Beneficiis humana vita consistit et concordia; nec terrore, sed mutuo amore, in fœdus auxiliumque commune constringitur.” No man could enjoy to a higher degree, or more successfully lead others to enjoy, innocent mirth at the social board. He was one of the earliest members and most regular attendants of the Harveian Society—a society which was formed with the intention of encouraging experimental inquiry among the rising generation, and in promoting convivial cheerfulness among its living members. In every respect Dr. Monro was an honest and an honourable man. He was no flatterer; but he did not withhold applause where he thought it was merited. Both the applause and the censure of Dr. Monro upon all occasions demonstrated the candid, the open, and the honest man.

As a citizen, a friend, and a parent, his conduct was amiable and affectionate in the highest degree; and as a medical writer and teacher he had few equals among his contemporaries. His various published works may be recapitulated as follows:—*Treatise on the Lymphatics*, 1770; *On the Anatomy of Fishes*, 1785; *On the Nerves*, 1783; *On the Bursæ Mucosæ*, 1788; and three treatises on the *Brain*, the *Eye*, and the *Ear*, 1797.

Dr. Monro's chief amusements lay in the witnessing of dramatic performances and in the cultivation of his garden. Not many years after his establishment in Edinburgh he purchased the beautiful estate of Craiglockhart, on the banks of the Water of Leith, within a few miles of the city. He planted and beautified some charmingly romantic hills, which afforded him such delightful prospects of wood and water, hill and dale, city and cottage, as have seldom been equalled; and here he spent many hours stolen from the labours of his profession. In 1800, finding his health declining, he began to receive the assistance of his son, Dr. Alexander Monro, *tertius*, who succeeded him as professor of anatomy; but he continued to deliver the most important part of the lectures till 1808-9, when he closed his academical labours, to the regret of his numerous students. At the same time he gave up his medical practice, but survived till the 2d of October, 1817, when he died in the eighty-fifth year of his age.

MONTEATH, GEORGE CUNNINGHAM, author of a *Manual of the Diseases of the Human Eye*, was born, December 4, 1788, in the manse of Neilston, Renfrewshire, of which parish his father, the Rev. Dr. John Monteath (laterly of Houston and Killallan), was then minister. After passing through the medical and surgical classes in the university of Glasgow, the subject of this short memoir attended the hospitals in London, where he attracted the notice of Sir Astley Cooper and other eminent anatomists, and received a diploma from the Royal College of Surgeons. In 1809, by the recommendation of Dr. M. Baillie, he was appointed surgeon to Lord Lovaine's Northumberland regiment of militia, in which situation he remained four years, honoured with the affection and esteem of all his brother officers. He then resigned his commission, and commenced practice in Glasgow as a physician and oculist. In 1813 he commenced with a friend a series of lectures on practical anatomy, but was soon obliged, by the rapid increase of his practice, to relinquish this duty. Being the first practitioner in Glasgow who devoted particular attention to the diseases of the eye, he soon became celebrated, not only in the city, but over all the west of Scotland, for his skilful treatment of that class of complaints, and had many important and difficult cases intrusted to him. In 1821 he published his *Manual of the Diseases of the Human Eye*, which became a popular work on the subject. Though possessed originally of a good constitution, Dr. Monteath gradually sank under the pressure of his multifarious duties; and having been seized with inflammation in consequence of a night journey, he was cut off, January 25, 1828, in the fortieth year of his age.

Dr. Monteath was characterized by one who knew him well, and who undertook the task of commemorating his death in the public prints, as "at once an accomplished physician and an eminent surgeon." His mind, distinguished as it was by clearness of method, minuteness of observation, and soundness of judgment, was particularly fitted for the investigations of the former profession. His power of distinguishing (perhaps the power upon which

success in the practice of medicine depends more than any other), added to his thorough knowledge of what others had discovered, and his readiness in applying what either his erudition or his experience supplied, made some regret that he did not devote himself to the business of a physician alone.

"As a surgeon, however, his success was perhaps still more remarkable. It was not the success of chance—it was the result of patient application at an early period of life to that science, without which all attempts at eminence in this department must necessarily fail—we mean the science of anatomy. It was the result of close and emulous attention to the practice of the ablest surgeons in the metropolis. It was attributable in no small degree to an accuracy in planning his operations, and a collectedness of mind at the time of operation, such that no accident could occur which had not been preconsidered, or which could in the slightest measure discompose him. Every surgical operation which he undertook had evidently been the subject of much previous thought—every ordinary circumstance had been carefully investigated—many circumstances which a common mind would probably have overlooked, had been weighed with deep attention—and neither the honour of his art nor the safety of his patient was at any time left to what might occur at the moment.

"Dr. Monteath was particularly distinguished as an oculist, and was unquestionably the first individual in this city who materially improved the treatment of the diseases of the eye. It was here that the qualities of mind to which we have already alluded were of the greatest service to him—namely, his power of minute observation, and the art, in which he so highly excelled, of distinguishing cases, which, though they might seem alike when viewed superficially, were in fact very different, and might require even opposite means of cure.

"Dr. Monteath's attention to his patients was particularly deserving of approbation—it extended to the poorest as well as the richest, and allowed no circumstance to escape notice which could tend, even in a remote degree, to alleviate suffering or secure recovery. Those who had no other means of judging of his superiority as a medical practitioner must have been struck with this trait of his character, and acknowledged it as an excellence of no mean value. His manner was soothing, and his politeness fascinating. None who had ever employed him as a medical attendant could see him approach without feeling their distress already in part subdued, their fears allayed, and their hopes invigorated, by the presence of one in whose ample skill and unwearied pains they could so implicitly confide."

MONTGOMERY, ALEXANDER, an early poet of considerable fame, appears to have been a younger son of Montgomery, of Hazelhead Castle in Ayrshire, a branch of the noble family of Eglintoun. He flourished in the reign of James VI., but probably wrote verses at an antecedent period, as some of his compositions are transcribed in the *Bannatyne Manuscript*, which was written in 1568. The date of his birth—further than that it was upon an Easter-day—the place and nature of his education, and the pursuits of his early years, are all involved in obscurity. He is said to have been brought up in the county of Argyle—a fact which seems to gather some confirmation from a passage in Dempster—"eques Montanus vulgo vocatus,"—as if he had acquired some common nickname, such as "the Highland trooper;" for Montgomery never was knighted. There is some reason to suppose that he was at one time a domestic or commander in the guard of the

regent Morton. His most familiar title, "Captain Alexander Montgomery," renders it probable that the latter was the nature of his office, for the word *captain* seems to have been first used in Scotland in reference to officers in the immediate service of the sovereign. Melville, in his *Diary*, mentions that when Patrick Adamson was promoted to the archbishopric of St. Andrews (an event which occurred in the year 1577), there was then at court "Captain Montgomery, a good honest man, and the regent's domestic," who, recollecting a phrase which the new primate had been accustomed to use in his sermons, remarked to some of his companions, "for as often as it was reported by Mr. Patrick, *the prophet would mean this*, I never understood what the prophet meant till now."

Montgomery appears afterwards to have been in the service of King James, who, in his *Revels and Cautelis*, published in 1582, quotes some of the poems of the subject of this memoir. His services were acknowledged by a pension of 500 merks, chargeable upon certain rents of the archbishopric of Glasgow, which was confirmed in 1583, and again in 1589. Various places throughout Scotland are pointed out by tradition as having been the residence of Montgomery, particularly the ruins of Compston Castle, near Kirkcudbright, now involved in the pleasure-grounds connected with the modern mansion-house of Dundrennan. In 1586 the poet commenced a tour of the Continent. After his return he was involved in a tedious and vexatious lawsuit respecting his pension, which drew from him some severe remarks upon the lawyers and judges of that time. Of his principal poem, *The Cherry and the Slae*, the first known edition was printed by Robert Waldegrave in 1607. The poet appears, from a passage in a memoir of Mure of Rowallan,¹ his nephew, to have died between this date and 1611.

"The poems of Montgomery," says Dr. Irving, "display an elegant and lively fancy; and his versification is often distinguished by a degree of harmony, which most of his contemporaries were incapable of attaining. He has attempted a great variety of subjects as well as of measures, but his chief beauties seem to be of the lyric kind. It is highly probable that his taste was formed by the study of the Italian poets: he has left many sonnets constructed on the regular model, and his quaint conceits seem not unfrequently to betray their Italian origin. The subject of love, which has afforded so fertile a theme to the poets of every age and nation, has furnished Montgomery with the most common and favourite topic for the exercise of his talents. . . . His most serious effort is *The Cherry and the Slae*, a poem of considerable length, and certainly of very considerable ingenuity. . . . The images are scattered even with profusion; and almost every stanza displays the vivacity of the author's mind. In this, as well as in his other productions, Montgomery's illustrations are very frequently and very happily drawn from the most familiar objects; and he often applies proverbial expressions in a very pointed and pleasing manner. . . . The genuine explanation of the allegory may perhaps be that virtue, though of very hard attainment, ought to be preferred to vice: virtue is represented by the cherry, a refreshing fruit, growing upon a tall tree, and that tree rising from a formidable precipice; vice is represented by the sloe—a fruit which may easily be plucked, but is bitter to the taste."

The Cherry and the Slae has longer retained popularity than any other poetical composition of the reign of James VI. It continued to be occasionally

printed for popular use till a recent period; and in 1822 this, as well as the other poetical works of Montgomery, appeared in a very handsome edition under the superintendence of Mr. David Laing. Dr. Irving contributed to the publication a biographical preface, from which we have chiefly derived the present memoir.

MONTGOMERY, JAMES, was the last of the brilliant galaxy of poets (excepting Samuel Rogers) which illuminated the hemisphere of British literature in the early part of the present century. He was born at Irvine, in Ayrshire, November 4, 1771. His father was a Moravian minister stationed at that time in Irvine. The house where the poet was born still exists, and is an object of interest to strangers visiting the town. It was originally a detached building, situated in the centre of an open space, and consisted of a pretty large room, which was used as a chapel by the Moravian congregation, and a separate apartment in which the family lived, and where the poet was born. The house is now surrounded by other buildings, and what was once the chapel is occupied as a weaver's shop. The poet's father must have been in straitened circumstances, as he found it necessary to devote part of his time to a manual occupation; and a townsman and friend of the poet's, who has furnished the writer with several other particulars of his early history, remembers being informed by an old friend, about forty years ago, that he recollect attending the chapel one evening in his youth, when the poet's father closed the service by addressing the congregation in substance as follows:—"I am a man of simple tastes and habits, but I cannot live upon air; and therefore, individuals present will have an opportunity when they retire of leaving behind them what they think proper towards my support." The Moravian cause seems not to have found a genial soil in Irvine, as, on the removal of the poet's father to Ireland, in 1775, no preacher appears to have succeeded him. The town of Ayr now possesses the only Moravian congregation in Scotland. From the period when his father was ordered by the Moravian body to do duty at their establishment of Gracehill, near Ballymena, in Ireland, and whither he accordingly removed his family, till the year 1841, being a period of sixty-six years, James Montgomery had not once visited Scotland. He was between four and five years of age when he left Irvine, but his recollections of his early years were extremely vivid, and on the occasion of his visit to his native town he related some of them with great delight to a meeting of the inhabitants assembled to do him honour. One of these anecdotes was connected with his removal from Ireland to the Moravian school at Fulneck, near Leeds, in Yorkshire. He had received the elements of his education from "Jemmy M'Caffery," the village schoolmaster at Gracehill, and being now between six and seven years of age, it was determined to send him to school in England. Taking a child's farewell of his mother, he and his father embarked in a vessel bound for Liverpool, and were overtaken by a violent storm. The poet remembered how his childish terror was soothed by the affection of his father, and his confidence restored by his expressions of trust in the providence of God and the love of his Redeemer. The effect produced upon the boy attracted the attention of the master of the vessel, who, himself evincing considerable solicitude in the trying circumstances, observed—"I would give a hundred guineas for the faith of that child." Mr. Montgomery took great pleasure in looking back upon the incidents of the voyage, as having called forth

¹ Lyle's *Ballads*, London, 1827.

memorable evidence of the simple faith and piety of his father. James was placed in the Moravian institution at Fulneck, in October, 1777. Another of his early reminiscences related to this school. It was visited on one occasion by the celebrated Lord Monboddo, whose figure the poet recalled as dressed in a rough closely-buttoned coat, with top-boots, and carrying in his hand a large whip, such as huntsmen use. He inquired if there was any Scotch boy in the school; and the teacher having produced young Montgomery, Lord Monboddo looked the future poet sternly in the face, and, after addressing to him some counsels suitable to his years—holding the whip towards him, as the boy thought, in unpleasant proximity—"Mind, sir," he added, "that I trust you will never do anything to disgrace your country." "This," said the poet, "I never forgot, nor shall I forget it while I live. I have, indeed, endeavoured so to act hitherto, that my country might never have cause to be ashamed of me; nor will I, on my part, ever be ashamed of her." In 1783 John Montgomery and his wife, the father and mother of the poet, proceeded to the West Indies as missionaries. The only allusion in Montgomery's poems to the place of his birth occurs in the verses written on revisiting Fulneck school in 1806, and the remembrance of Irvine recalled the image of his sainted parents, both of whom had died in the West Indies:—

"The loud Atlantic ocean,
On Scotland's rugged breast,
Rocks, with harmonious motion,
His weary waves to rest,
And gleaming round her emerald isles
In all the pomp of sunset smiles.
On that romantic shore
My parents hailed their first-born boy;
A mother's pangs my mother bore,
My father felt a father's joy;
My father, mother—parents now no more!
Beneath the Lion Star they sleep,
Beyond the western deep,
And when the sun's noon-glory crests the waves,
He shines without a shadow on their graves."

The boy remained for ten years at Fulneck, where he was carefully educated, it being the wish of the Brethren to train him for the ministry; but the bent of his mind not being in that direction, the intention was not persisted in. His first poetical impulse was received from reading Blair's *Grave*. At the age of twelve he produced some small poems, and his taste for poetry was cherished by reading extracts from Milton, Thomson, and Young, together with such books as he could procure and enjoy by stealth. He was sent to earn his bread as an assistant in a chandler's shop, but did not take kindly to the occupation, ran away from his master, and after another year of service with a second, at last set off to London with 3s. 6d. in his pocket to seek fame and fortune. He offered a manuscript volume of verse to Mr. Harrison, publisher, Paternoster Row, who rejected the poetry, but engaged the poet as a clerk. In this situation he continued for eight months, but feeling the drudgery irksome, he made his way back to Yorkshire. In 1792 he obtained employment in the establishment of Mr. Gales, a bookseller in Sheffield, who had commenced a newspaper named the *Sheffield Register*. Montgomery found the labour of a journalist congenial to his tastes; but those were difficult times for men who entertained and propagated liberal opinions, as the young poet soon discovered. Mr. Gales was obliged to flee from England, to avoid prosecution for printing an article which incurred the displeasure of the despotic government of the day. The poet now became the editor and publisher of the paper, changing its name to the *Sheffield Iris*. Although more prudent and

moderate than his predecessor, he was also more gifted, and therefore more obnoxious to men in power, who set a watch for his halting. The whole nation was convulsed by the example and influence of the French revolution, and political feeling ran high in Sheffield, when Montgomery undertook the labours and responsibility of editorship. Reverting thirty-one years afterwards, in his valedictory address to his readers, to this era of his life, he said:—"With all the enthusiasm of youth, for I had not then arrived at years of discretion, I entered into the feelings of those who avowed themselves the friends of freedom, justice, and humanity. Though with every pulse of my heart beating in favour of the popular doctrines, my retired and religious education had laid restraints upon my conscience, which (I may fearlessly say so) long kept me back from personally engaging in the civil war of words raging in the neighbourhood, beyond occasional rhyme, paragraph, or essay in the newspaper, written rather for the purpose of showing my literary than my political qualifications. Ignorant of myself, and inexperienced in the world as a child of seven years old, having actually not lived so long among its everyday inhabitants, even when I became editor of the *Iris*, I nevertheless was preserved from joining myself to any of the political societies till they were broken up in 1794, when, I confess, I did associate with the remnant of one of them for a purpose which I shall never be ashamed to avow—to support the families of several of the accused leaders, who were detained prisoners in London, under the suspension of the Habeas Corpus Act, and who were finally discharged without having been brought to trial." The rule of his editorial conduct, he adds, was, "a plain determination, come wind or sun, come fire or water, to do what was right." It was in 1794 that the *Iris* was commenced, and it was carried on "through a series of sufferings, desertions, crosses, and calamities without a name," persecuted by the aristocrats and abandoned by the Jacobins; yet the editor outlived the hostility of his enemies, won their confidence and friendship, and for years after 1805, which ended, as he observes, the "romance" of his life, he was supported by the same arms that had fought against him, in a path of moderate prosperity. The more romantic incidents of the period referred to were his being twice prosecuted and imprisoned for alleged political offences. An example was wanted, as he tells us, to deter others from doing what *he* had not yet done, but what *they* were doing with impunity. He had scarcely been installed a month in the editorial chair when he was one day called into the bookseller's shop, where business-orders were received, to see an old grotesque-looking ballad-monger, who was offering twelve songs for a penny, and running glibly over a catalogue of their names. Presenting Montgomery with a specimen of the article, he inquired what would be the cost of six quires of the same. The reply was that the presses were better employed than in printing such commodities, and he was recommended to apply elsewhere. "But you have *this* standing in your office," was the rejoinder; whereupon, expressing his ignorance of the fact, Montgomery took up the printed leaf, and found that it contained two copies of verses, with each of which he had long been familiar, although he had never before seen them in that particular form. In a wood-cut figure of Liberty and the British lion he now recognized the frontispiece of an extinct periodical conducted by his predecessor; and on inquiring in the printing-office, he found that the ballads had been put in type surreptitiously by one of Mr. Gales' apprentices, for the use of his companions, and that

the ballad-vendor had lately, for old acquaintance sake, been furnished by the foreman with a quantity for sale. On learning these particulars Montgomery allowed the poor fellow to obtain what he wanted. Eighteenpence worth of the ballads was accordingly worked off, and paid for. In two months afterwards Montgomery was arrested, on a magistrate's warrant, for publishing a certain seditious libel respecting the war then waging between his majesty and the French government, entitled *A Patriotic Song by a Clergyman of Belfast*, which song had, in fact, been composed in 1792, a year before the war with France commenced, and referred solely to the invasion of France by the armies of Austria and Prussia. It was enough that the song had been printed by Montgomery, and vended by a ballad-monger, who went about crying "Straws to sell!" and giving away the ballad into the bargain. A constable purchased a straw, obtained the ballad to boot, and took the ballad-seller into custody. Upon the evidence of the constable and the ballad-monger, Montgomery was found guilty of the publication, by a jury at Doncaster sessions, January 22, 1795; and the sentence of the court was three months' imprisonment in the castle of York, and a fine of £20. Forty-four years afterwards, in 1839, Mr. Montgomery received a packet, containing several of the original documents connected with his trial. Amongst these was a letter from the Duke of Portland, then the home-secretary, to a local magistrate, approving of the steps taken against the song-seller and the publisher. The "compliments" of the attorney-general, Sir John Scott, afterwards Lord Eldon, were, according to instructions from Mr. White, solicitor to the treasury, to accompany the brief to three counsel named, and the Sheffield solicitor's bill of costs was endorsed *Rex v. Montgomery*. "Thus (says the poet) I learned that I had actually suffered, not to say enjoyed, the honour of a state prosecution." A fragment of the original draft of the brief was also received, stating that "this prosecution is carried on chiefly with a view of putting a stop to the meetings of the associated clubs in Sheffield; and it is hoped that, if we are fortunate enough to succeed in convicting the prisoner, it will go a great way towards curbing the insolence they have uniformly manifested." The second offence for which Mr. Montgomery was tried and imprisoned, was the printing in his paper of a paragraph reflecting hardly upon the conduct of a magistrate in quelling a riot at Sheffield in 1795. The trial took place at Doncaster sessions in 1796, a verdict was given against the defendant, and he was sentenced to six months' imprisonment in York Castle, to pay a fine of £30 to the king, and to give security to keep the peace for two years. Mr. Montgomery never complained of this trial and sentence; and he records, in the introduction to his *Prison Amusements*, that the magistrate whom he had offended took the opportunity, a few years afterwards, of showing him both kindness and confidence in an affair of business, and that his conduct evinced that his mind was as much discharged of hostile feeling towards his editorial opponent, "as, I trust (says the latter), mine was of resentment against him." In the same spirit the poet in his valedictory address, in 1825, said—"I can now add that all the persons who were actively concerned in the prosecutions against me in 1794 and 1795 are dead, and without exception they died in peace with me. I believe I am quite correct in saying, that from each of them distinctly, in the sequel, I received tokens of goodwill, and from several of them substantial proofs of kindness."

Having failed to obtain poetical renown by his

youthful effusions, Mr. Montgomery informs us that he resolved to secure it by such means as made many of his contemporaries notorious. He wrote doggerel verse after the model of Peter Pindar, and prose in the style of Fielding and Smollett, occasionally imitating the wild flights of the German plays and romances. To the failure of these attempts he refers in this characteristic remark:—"A providence of disappointment shut every door in my face, by which I attempted to force my way to a dishonourable fame;" and he congratulates himself on having been saved from appearing as the author of works of which he should afterwards have felt ashamed. His first successful poetical effort was the *Wanderer of Switzerland*, which appeared in 1806. This poem, descriptive of the sufferings of the Swiss when the independence of their country was destroyed by France, was severely handled in the *Edinburgh Review*, and afterwards defended by Lord Byron. It was followed by the *West Indies*, written to accompany a series of pictures published as a memorial of the abolition of the slave-trade. In this genial labour, to which the poet says he gave his whole mind, as affording him an opportunity of exposing the iniquities of slavery and the slave-trade, he was associated with Grahame, the author of the *Sabbath*, and Miss Benger, who wrote several works in history and biography. In 1813 appeared the *World before the Flood*, suggested to the poet by a passage in the eleventh book of *Paradise Lost*, referring to the translation of Enoch. This was followed in 1819 by *Greenland*, a poem in five cantos, the plan, which was not fully carried out, being to describe the original condition of the country and its people, and exhibit the changes wrought by the introduction of the gospel by the Moravian missionaries. The last and best of Montgomery's works, the *Pelican Island*, was published in 1827, and confirmed the author's title to a high place amongst the British poets. It is the most imaginative of all his writings, and abounds in fresh and vigorous description. Each of the principal poems, issued at intervals, was accompanied by minor and miscellaneous compositions, many of them of great merit, and possessing the elements of lasting popularity. The *Prison Amusements* is the name given to a series of small poems on various subjects, written during his incarcerations in York Castle. The *Grave* appeared in the first volume of the poet's works, and is one of the best known of his minor pieces.

In *Thoughts on Wheels* the poet denounced the national wickedness and folly of the state lotteries, and powerfully contributed to the abolition of this disgraceful method of replenishing the public treasury. In this poem Montgomery introduces an apostrophe to Britain, breathing a lofty strain of patriotism and piety. When he visited Scotland in 1841, he read these verses at a public breakfast to which he was invited in Glasgow, as expressing his personal feelings towards his native land and its noble institutions. The sufferings of chimney-sweepers' apprentices engaged his sympathy, and drew from his pen a series of verses, under the title of the *Climbing Boy's Soliloquies*. He paraphrased a number of the Psalms of David in *Songs of Zion*, but admitted, when in Scotland, that no version of the Psalms came up to that used in the Presbyterian churches for Scriptural simplicity and truthfulness to the original. "The Common Lot," "The Little Cloud," "Night," "Robert Burns," "The Daisy in India," "Friends," "A Voyage Round the World," and numerous hymns, are amongst the minor compositions which have made his name familiar wherever there is piety to feel their force and taste to appreciate their beauty. His collected poetical works were

published by Longman and Co., London, in four 12mo volumes, in 1841, and an edition in one volume appeared in 1851. This was followed in 1853 by *Original Hymns, for Public, Private, and Social Devotion*. Montgomery also produced several prose writings, lectured on poetry, and edited *The Christian Poets*, published by Collins in Glasgow. The religious character of his larger poems has no doubt limited the range of his readers, but both in this country and in America his works enjoy a high reputation, and in the United States have run through numerous editions. The purity of his language, the fluency of his numbers, and above all the evangelical spirit of his religious compositions, have exerted a considerable influence upon public taste and feeling. The tendency of all he wrote was to purify and elevate. The Catholicity of his religious poems reflects the spirit of their author, who was singularly free from sectarian narrowness. His latter years were devoted to active usefulness and works of beneficence in Sheffield, where he was universally known and beloved. He died at his residence, the Mount, in that town, April 30, 1854, in his eighty-third year, and was honoured with a public funeral. The venerable poet had enjoyed, for some years, a well-deserved literary pension from government, of £150 a year.

MONTROSE, MARQUIS OF. *See* GRAHAM (JAMES).

MOOR, JAMES, LL.D., an eminent Greek scholar, was the son of Mr. Robert Moor, schoolmaster in Glasgow—a person of considerable learning, and of such unwearied industry, that, being too poor to purchase Newton's *Principia*, he copied the whole book with his own hand. The subject of this notice entered the university of Glasgow in 1725, and distinguished himself by great industry and capacity as a student. After finishing his academical course, and taking the degree of M.A., with considerable applause, he taught a school for some time in Glasgow. This situation he seems to have abandoned in order to become tutor to the Earls of Selkirk and Errol, in which capacity he travelled abroad. He was afterwards in the family of the Earl of Kilmarnock; and on the burning of Dean Castle, which took place in his absence, lost a considerable stock of books, which he had employed himself in collecting for his own use. Without the knowledge of the earl, Moor instructed Lord Boyd in Greek, so that the young nobleman was able to surprise his father one day by reading, at his tutor's desire, one of the odes of Anacreon. In 1742 he was appointed librarian to the university of Glasgow; and in July, 1746, became professor of Greek in the same institution, the Earl of Selkirk advancing him £600 in order to purchase the resignation of the preceding incumbent. On the condemnation of his patron, the Earl of Kilmarnock, for his concern in the insurrection of 1745, Moor, who was of opposite politics, made a journey to London for the purpose of making interest with the ministers for his lordship's pardon—an enterprise honourable to his feelings, however unsuccessful.

Moor was a useful professor, and besides his academical duties, conferred some benefits on the literary world by his publications. In company with Professor Muirhead he superintended, at the request of the university, a very splendid edition of Homer, published by the Foulises of Glasgow. He also edited their Herodotus, and was of service in several of their other publications. Some essays read by him before the Literary Society [of Glasgow], of which he was a constituent member, were collected

and published in 8vo in 1759. In 1766 he published *A Vindication of Virgil from the Charge of Puerility imputed to him by Dr. Pearce*, 12mo. His principal work, however, was his *Grammar of the Greek Language*, which has ever since been very extensively used in schools. He collected a large and valuable library, and selected a cabinet of medals, which the university afterwards purchased. In 1761 he was appointed vice-rector of the college by the Earl of Errol, the lord-rector, who, under the designation of Lord Boyd, had formerly been his pupil. In 1763 he applied to the university for the degree of Doctor of Laws, which was granted to him in consideration of his talents and services. Dr. Moor was addicted to the cultivation of light literature, and used to amuse himself and his friends by writing verses in the Hudibrastic vein. He resigned his chair in 1774 on account of bad health, and died on the 17th of September, 1779.

MOORE, DUGALD. This poet, who in humble life attracted attention, and won for himself a respected name solely by the power of his genius, was born in Stockwell Street, Glasgow, in August, 1805. His father, who was a private soldier in a Highland regiment, died early in life, and such was the poverty of the widow, that Dugald's only education was such as she was able herself to impart to him. The education, however, of one who is born a poet does not mainly depend on teachers and school-books. While as yet a mere child he was sent to serve in the workshop of a tobacco-spinner; but this coarse and stupefying occupation he abandoned in youth, for a place in the copper-printing branch of the establishment of Messrs. James Lumsden and Son, booksellers, Queen Street, Glasgow. Dugald Moore began to write verses at an early period; and Mr. Lumsden, who valued the good qualities of his protégé and admired his poetry, exerted himself to procure subscribers for the *African, a Tale, and other Poems*, so that Moore was enabled in 1829 to publish the volume. It was so favourably received that in the following year a second edition was required, and about the same time its author published a second work, entitled *Scenes from the Flood; the Tenth Plague, and other Poems*. In 1831 Moore published the *Bridal Night, and other Poems*, a larger and more pretentious work than the two preceding ones. After having written so much poetry in so short a time, Dugald, who had his aged mother to support, opened a shop, and commenced business in his native city as a bookseller and stationer, which he was enabled to do from the profits of his publications; and his shop, which was in 96 Queen Street, became a favourite resort of literary men—a distinction which soon established and advanced his business as a bookseller.

Although he had thus shown his good sense in embracing the first opportunity of settling down in life instead of trusting to the precarious support of authorship, Dugald still retained his love of poetry unabated, and employed his leisure hours in its cultivation. The result was, the *Bard of the North*, a series of poetical tales, illustrative of Highland scenery and character, which he published in 1833; the *Hour of Retribution, and other Poems*, which appeared in 1835; and the *Devoted One, and other Poems*, which he published in 1839. In so short a time he had thus done enough for poetical fame; but numerous as were his publications, they were all distinguished by a sterling excellence that seldom accompanies such prolific abundance; and although his subjects were not chosen for the day, by which he might have secured a wide but temporary popularity and larger profit, his poetry was of that sub-

stantial excellence whose reputation is rather enhanced than extinguished by the lapse of years. Extensive and varied though it was, it sustained its vigour to the last, and was distinguished by a lofty fancy, intense energy of feeling, and remarkable powers of versification, which constitute the chief essentials of poetry. As many of our readers may be unacquainted with his works, we give the following short specimen from his smallest pieces, as best suited to our limits:—

"THE FIRST SHIP.

"The sky in beauty arch'd
The wide and weltering flood,
While the winds in triumph march'd
Through their pathless solitude—
Rousing up the plume on ocean's hoary crest,
That like space in darkness slept,
When his watch old Silence kept,
Ere the earliest planet leapt
From its breast.

"A speck is on the deeps,
Like a spirit in her flight;
How beautiful she keeps
Her stately path in light!
She sweeps the shining wilderness in glee—
The sun has on her smiled,
And the waves, no longer wild,
Sing in g'ory round that child
Of the sea.

"'Twas at the set of sun
That she tilted o'er the flood,
Moving like God alone
O'er the glorious solitude—
The billows crouch around her as her slaves.
How exulting are her crew!—
Each sight to them is new,
As they sweep along the blue
Of the waves.

"Fair herald of the fleets
That yet shall cross the waves,
Till the earth with ocean meets
One universal grave,
What armaments shall follow thee in joy!
Linking each distant land
With trade's harmonious band,
Or bearing havoc's brand
To destroy!"

In writing so much as he did, Moore seems to have had a premonition that his day would close ere his sun had gone down. He died unmarried, after a brief illness, on the 2d of January, 1841, in the thirty-sixth year of his age, leaving his widowed mother, whom he had supported, in possession of a comfortable competency. He was interred in the Necropolis of Glasgow, and over his grave a massive monument surmounted by his bust was erected by his personal friends to perpetuate his memory.

MOORE, DR. JOHN, a miscellaneous writer of the last century, was born in Stirling in the year 1730. His father, the Rev. Charles Moore, was a clergyman of the Scottish Episcopal church settled at Stirling. His mother was the daughter of John Anderson, Esq., Dowhill, Glasgow.

On the death of his father, which took place in 1735, his mother removed with her family to Glasgow, where a small property had been left her by her father. Having here gone through the usual course of grammar-school education, young Moore was matriculated at the university, and attended the various classes necessary to qualify him for the profession of medicine, for which he was early intended. At a more advanced stage of his studies he was placed under the care of Dr. Gordon, an eminent practitioner of that day; and while under his tuition attended the lectures of Dr. Hamilton, then anatomical demonstrator, and those of the celebrated Dr. Cullen, at that time professor of medicine at Glasgow.

In 1747 Mr. Moore, desirous of adding to the pro-

fessional knowledge which he had already acquired by visiting a new and wider field of experience, proceeded to the Continent, under the protection of the Duke of Argyle, to whom he had procured an introduction. The duke, then a commoner, was lieutenant-colonel of a regiment of foot, and was about to embark for Flanders to serve under the Duke of Cumberland, who was there in command of the allied army. On arriving at Maestricht he attended the military hospitals there in the capacity of inmate, and found abundance of practice, as these receptacles were filled with soldiers wounded at the battle of Laffeldt, which had just been fought. In consequence of a recommendation which he soon after obtained from Mr. Middleton, director-general of the military hospitals, to the Earl of Albemarle, Mr. Moore removed to Flushing, where he again attended the military hospitals. From this duty, however, he was almost immediately called to the assistance of the surgeon of the Coldstream foot-guards, of which regiment his new patron, the Earl of Albemarle, was colonel. With this corps Mr. Moore, after passing the autumn of 1747 in Flushing, removed to Breda, where he spent the winter in garrison. In the summer of the following year, a peace having been in the meantime concluded, he returned to England with General Braddock.

Although thus fairly on the world, and in possession of very considerable experience in his profession, Mr. Moore was yet only in the seventeenth year of his age. After remaining some time in London, during which he attended the anatomical lectures of his celebrated countryman Dr. Hunter, he went to Paris to acquire what knowledge might be afforded by an attendance on the hospital and medical lectures of that city, then reckoned the best school in Europe. Fortunately for Mr. Moore, his early patron, the Earl of Albemarle, was at this time residing in Paris as ambassador from the court of Great Britain. Mr. Moore lost no time in waiting upon his excellency, who, having always entertained the highest opinion of his merits, immediately appointed him surgeon to his household. He had thus an opportunity afforded him of enjoying the first society in Paris, being at all times a welcome guest at the table of the ambassador.

After residing nearly two years in the French capital, Mr. Moore was invited by his first master, Dr. Gordon, to return to Glasgow, and to enter into partnership with him in his business. With this invitation he thought it advisable to comply, and soon after left Paris. He returned, however, by the way of London, where he remained a few months for the purpose of attending another course of Dr. Hunter's lectures, together with those of Dr. Smellie on midwifery. From London he proceeded to Glasgow, when the proposed connection with Dr. Gordon immediately took place. This connection continued for two years. At the end of that period, his partner having received a diploma, confined himself solely to the practice of physic, while Mr. Moore continued the business of a surgeon, assuming now as his partner Mr. Hamilton, professor of anatomy, instead of Dr. Gordon, who had necessarily, from the change in his practice, withdrawn from the concern.

In 1769 a circumstance occurred which totally altered Dr. Moore's prospects in life, and opened up others more congenial, there is every reason to believe, than those to which his profession confined him. In the year just named he was called upon to attend James George, Duke of Hamilton, who, then but in the fourteenth year of his age, was affected with a consumptive disorder, of which, after a lingering illness, he died. Dr. Moore's assiduity in this

case, although unavailing as to the issue, led to a close connection with the noble family of his late patient. In the following year, having previously obtained a diploma as Doctor of Medicine from the university of Glasgow, he was engaged by the Duchess of Hamilton to attend her son, the Duke of Hamilton, brother of his late patient, as a companion during his travels. The duke, who was at this time about fourteen or fifteen years of age, was, like his brother, also of a sickly constitution, and in Dr. Moore was found exactly such a person as was fittest to attend him; one who combined a knowledge of medicine with some experience of Continental travel, and an enlightened mind. The young duke and his companion remained abroad for five years, during which they visited France, Italy, Switzerland, and Germany.

On his return from the Continent, which was in the year 1778, Dr. Moore removed with his family from Glasgow to London, and in the year following, 1779, published his celebrated work, entitled a *View of Society and Manners in France, Switzerland, and Germany*. This work was so well received, that it attained a seventh edition in less than ten years, besides the Irish editions, and French, German, and Italian translations. Two years afterwards he published a continuation of the same work, entitled a *View of Society and Manners in Italy*. During this period, however, his medical practice was by no means extensive—a circumstance which has been attributed, not to any disinclination on the part of the public, with whom he was so popular as an author, to patronize him, but to his own reluctance to engage in the drudgery entailed on a general practice. The rambling and unfettered life which he had led upon the Continent had, in a great degree, unfitted him for the laborious routine of professional duty; and his reluctance again to involve himself in it appears to have adhered to him throughout the whole of his after-life, and greatly marred his prosperity in the world.

In 1785 he published his *Medical Sketches*—a work which sufficiently showed that his limited practice did not proceed from any deficiency of knowledge in his profession. It was received with much favour by the public, although it is said to have given offence to some of the medical gentlemen of the time, who thought their interest likely to suffer by the disclosures which it made of what had hitherto been considered amongst the secrets of the profession.

Dr. Moore's next publication was his celebrated novel, *Zeluco*—a work unquestionably of the very highest order of merit, and which has long since become one of the fixed and component parts of every British library.

In the August of 1792 he went to Paris to witness with his own eyes the memorable proceedings which were then in progress in the French capital, and which others were content to learn from report. Dr. Moore on this occasion frequently attended the National Assembly. He was present also at the attack on the Tuileries, and witnessed many other sanguinary doings of that frightful period. On his return to England he began to arrange the materials with which his journey had supplied him, and in 1795 published a *View of the Causes and Progress of the French Revolution*, in two volumes 8vo, dedicated to the Duke of Devonshire. This work was followed in 1796 by *Edward: Various Views of Human Nature, taken from Life and Manners, chiefly in England*; and this again, in 1800, by *Mordaunt, being Sketches of Life, Characters, and Manners in Various Countries, including the Memoirs of a French Lady of Quality*, in two volumes 8vo. These works

scarcely supported the reputation which their author had previously acquired: in the latter he is supposed, in detailing some gallant feats of a young British officer, to allude to his heroic son, General Sir John Moore, who was then a field-officer.

Dr. Moore has the merit of having been one of the first men of note who appreciated and noticed the talents of Burns, who drew up, and forwarded to him, at his request, a sketch of his life. This was followed by a correspondence in 1787, which is to be found in those editions of the poet's works which include his letters.

At the time of the publication of his last work, *Mordaunt*, Dr. Moore had attained the seventieth year of his age. He did not again appear before the public, but spent the short remaining period of his life in the quiet seclusion of his residence at Richmond, in Surrey. After an illness of considerable duration, he died at his house in Clifford Street, London, February 29, 1802.

"As an author," says a distinguished modern writer,¹ "Dr. Moore was more distinguished by the range of his information than by its accuracy or extent upon any particular subject; and his writings did not owe their celebrity to any great depth or even originality of thought. As a novelist, he showed no extraordinary felicity in the department of invention; no great powers of diversifying his characters, or ease in conducting his narrative. The main quality of his works is that particular species of sardonic wit with which they are indeed perhaps profusely tinctured, but which frequently confers a grace and poignancy on the general strain of good sense and judicious observation that pervades the whole of them."

Dr. Moore left five sons and one daughter by his wife, previously Miss Simson, daughter of the Rev. Mr. Simson, professor of divinity in the university of Glasgow. The eldest of the former, John, became the celebrated military general already alluded to; the second adopted his father's profession; the third entered the navy; the fourth was admitted into the department of the secretary of state; and the fifth was bred to the bar.

MOORE, SIR JOHN, a distinguished military commander, was born at Glasgow on the 13th of November, 1761. He was the eldest son of Dr. John Moore, the subject of the preceding article, by a daughter of John Simson, professor of divinity in the university of Glasgow. His education, commenced at a public school in Glasgow, and afterwards advanced at the university of that city, was completed under the eye of his father, then acting as travelling tutor to the Duke of Hamilton. The subject of this memoir accompanied Dr. Moore during five years of continental travel, by which means he acquired a knowledge of most European languages, and a degree of polish and intelligence very uncommon in young men of his rank, either in that or the present age. Having chosen the army as a profession, he obtained, through the Hamilton interest, a commission as ensign in the 51st regiment, which he joined at Minorca in 1776, being then only fifteen years of age. A lieutenancy in the 82d regiment was his first step of promotion; and he seems to have held that station without much distinction or any censure during the several campaigns of the American war, at the end of which, in 1783, his regiment was reduced. In 1788 he was appointed major in the 60th; but this he soon exchanged for

¹ Mr. Thomas Campbell, in his memoir of Dr. Moore, contributed to Brewster's *Edinburgh Encyclopedia*.

a similar post in his original regiment, the 51st; in 1790 he purchased a lieutenant-colonelcy in the same regiment.

Such was the rank of Sir John Moore at the commencement of the French revolutionary war. From Gibraltar, where he was then stationed, he was ordered, in 1794, to accompany the expedition for the reduction of Corsica. The bravery and skill which he displayed on this occasion, especially in storming the Mozello fort, where he received his first wound, introduced him to the favourable notice of General Charles Stuart, whom he succeeded soon after in the capacity of adjutant-general. Returning to England in 1795 he was raised to the rank of brigadier-general, and appointed to serve with Sir Ralph Abercromby in the expedition against the West Indies. There he assisted in the reduction of Demerara, Essequibo, and Berbice, and afterwards in that of St. Lucia; in which last enterprise he had an important post assigned to him, the duties of which he executed in such a manner, that he was characterized by General Abercromby as "the admiration of the whole army," and afterwards intrusted with the government of the island. This charge, undertaken with reluctance, and rendered full of danger and labour from the hostility of the natives and the number of Maroon negroes who constantly infested the country, was managed with a decision and activity that overcame every obstacle.

Two successive attacks of the yellow fever soon compelled General Moore to leave the West Indies; but, in company with Sir Ralph Abercromby, he was destined to reach yet higher distinction. The first scene in which they again acted together was the Irish rebellion of 1798. The victory gained over the rebels at Wexford, mainly owing to the talents of General Moore, was the prelude to the suppression of that luckless movement of an irritated people. This field of exertion was not that in which a soldier of good feelings can be anxious to gain distinction; nor was there much scope for military talent in the enterprise. It is, therefore, highly creditable to General Moore, that he acquitted himself of all the duties intrusted to him on the occasion with universal approbation.

In 1799 the subject of our memoir, promoted to the rank of major-general, served under Sir Ralph Abercromby in the unfortunate expedition to the Helder, where he displayed his wonted bravery, and was slightly wounded. In the subsequent campaign in Egypt under the same commander, he found a wider and more favourable theatre for the display of his military talents. In the landing at Aboukir he led the way, and carried by assault the batteries with which the French endeavoured to prevent that movement. In the subsequent battle of Aboukir, March 21, 1801, he conducted himself with signal gallantry, and was severely wounded.

At the end of the campaign he returned to England, and received the honour of knighthood, with the order of the Bath. For some time after this he held an important command in Kent, and afterwards succeeded General Fox in the command of the army in Sicily, whence he was recalled in the end of the year 1807. In the month of May, 1808, he was sent to the Baltic with an armament of 10,000 men, on behalf of the King of Sweden, who was at this time threatened with simultaneous attacks from France, Russia, and Denmark. With this force Sir John reached Gottenburg on the 17th, but was not permitted to land the troops; he himself, however, repaired to Stockholm, to consult with the Swedish cabinet. Here, to his astonishment, he learned that the Swedish monarch, despising the tame idea of

defensive operations, was wholly engrossed with dreams of conquest. He proposed that some Swedish regiments should be collected at Gottenburg, with which the British troops should be joined, and that this united force should take possession of Zealand. The British general represented this to be impossible, on account of the number of French and Spanish troops which occupied the island of Funen, and which could not, in present circumstances, be prevented from passing over to Zealand. It was next proposed to land the British alone in Finland, where they would have had the principal part of the whole effective force of the Russian empire to contend with. Sir John having, in reply to this proposal, modestly hinted that 10,000 British troops might not be found equal to such an undertaking, the impatient Gustavus ordered him to be instantly arrested. He had the good fortune, however, to make his escape, and with the troops returned immediately to England. Without being permitted to land, General Moore was ordered to proceed, under the command of Sir Harry Burrard, to Portugal, in order to give the aid of his talents to the expedition already formed in that country for the assistance of the Spanish patriots in expelling the French from their territory.

Sir John did not arrive in Portugal till after the signing of the convention of Cintra, and thus escaped all participation in the odium which was attached to that transaction. Disgusted with the manner in which the affairs of Portugal were conducted, Sir Arthur Wellesley, afterwards Duke of Wellington, applied for leave of absence, which was granted. Sir Hew Dalrymple was recalled, and Sir Harry Burrard having resigned, Sir John Moore was left commander-in-chief of the army. In this command he was formally confirmed by a letter from Lord Castlereagh, dated September 25, 1808, which informed him that an army under his orders, of not less than 35,000 men, 5000 of them cavalry, was to be employed in the north of Spain, for assisting the Spanish government. Fifteen thousand troops, it was stated, were to be sent to join him by the way of Corunna; and he was to make immediate preparations for carrying the plan into effect, it being left to his own judgment to march for some point in Galicia, or on the borders of Leon, by land; or to transport his troops by sea from Lisbon to Corunna, whither the reinforcements for his army were to be sent. Sir John Moore lost no time in entering upon the duties of his important charge, though he seems to have done so under a melancholy foreboding, sufficiently warranted by the miserable condition of his army, of what would be the result. "At this instant," he says, writing to Lord Castlereagh on the receipt of his commission, "the army is without equipments of any kind, either for the carriage of the light baggage of regiments, military stores, commissariat stores, or other appendages of an army, and not a magazine is formed in any of the routes (for he had determined on the expedition by land) by which we are to march." By a subsequent letter, written ten days after the above, we find that the army was also in a great measure destitute of money, and, amongst other necessities, particularly in want of shoes. On the 27th of October he left Lisbon, the greater part of the army being already on the route for Burgos, which had been assigned by the Spanish government as the point where the British forces were to be concentrated; Madrid and Valladolid were the places appointed for magazines: and Sir John Moore was officially informed that he would find 60,000 or 70,000 men assembled under Blake and Romana in the Asturias and Galicia, ready to

act along with him. These were stated to be independent of the armies in the front and on the left flank of the French position; the latter of which, under the command of the Marquis De Castanos, was supposed to be numerous and well appointed. The enthusiasm of the Spaniards in defence of their national independence was also stated to be such, that it would be utterly impossible for a French army to enter the defiles of the Asturias without being cut off by the armed peasants alone.

All these flattering representations the British general soon found to be utterly destitute of foundation. In marching through Portugal he was hardly treated with civility, and everything furnished to him by the authorities was charged at a high price. Specie, in Britain, was at the time not to be obtained, and not only government bills, but even promissory notes, were refused, which subjected the army to great inconvenience and much extra expense. The ignorance, too, of the Portuguese was so extreme, that the state of the roads could not be ascertained but by sending British officers, stage by stage, ahead of the advancing columns. With all these disadvantages, however, the general and a part of the army reached Almeida on the 8th of November. The weather was exceedingly rainy, but the troops moved on, and hitherto had conducted themselves with a propriety and moderation which surprised the inhabitants. Here, however, it was found that some soldiers had committed several serious crimes, and it being judged necessary that a signal example should be made to prevent their recurrence, one of the most notorious offenders was put to death. The general orders on this occasion we lay before the reader, as illustrative of the highly dignified and amiable character of Sir John Moore.

"Nothing could be more pleasing to the commander of the forces than to show mercy to a soldier of good character, who had been led inadvertently to commit a crime; but he should consider himself neglectful of his duty, if, from ill-judged lenity, he pardoned deliberate villany.

"The crime committed by the prisoner now under sentence is of this nature; and there is nothing in his private character or conduct which could give the least hope of his amendment, were he pardoned. He must, therefore, suffer the awful punishment to which he has been condemned. The commander of the forces trusts that the troops he commands will seldom oblige him to resort to punishments of this kind; and such is his opinion of British soldiers, that he is convinced they will not, if the officers do their duty, and pay them proper attention. He, however, takes this opportunity to declare to the army, that he is determined to show no mercy to plunderers and marauders, or, in other words, to thieves and villains. The army is sent by England to aid and support the Spanish nation, not to plunder and rob its inhabitants; and soldiers who so far forget what is due to their own honour, and the honour of their country, as to commit such acts, shall be delivered over to justice. The military law must take its course, and the punishment it awards shall be inflicted."

On the 11th of November the advanced guard crossed a rivulet which divides Portugal from Spain, and marched to Ciudad Rodrigo, the governor of which met the British general two miles from the city. A salute was fired from the ramparts, and the general was afterwards hospitably entertained in the principal house in the town. The state of the country and the manners of the people they found here to be remarkably changed, and the change highly to the advantage of Spain. At Ciudad Rodrigo

they were received by the people with shouts of "Viva los Ingleses." On the 13th Sir John Moore arrived at Salamanca, where he halted to concentrate his forces; Burgos, the place appointed for that purpose, being already occupied by the French. On his arrival at Salamanca Sir John Moore addressed a long letter to Lord William Bentinck, a few extracts from which will put the reader in possession of the knowledge of Sir John's feelings and views, and of the state of the country at this period. "I am sorry to say," he writes, "from Sir David Baird I hear nothing but complaints of the junta of Corunna, who offered him no assistance. They promise everything, but give nothing; and after waiting day after day for carts which they had promised to procure for the carriage of stores, his commissary was at last obliged to contract for them at an exorbitant price, and then got them. This is really a sort of conduct quite intolerable to troops that the Spanish government have asked for, and for whose advance they are daily pressing. On my arrival here and telling Colonel O'Lowlar that I wished to have supplies immediately provided on the road from Astorga to this place, for the march of the troops from Corunna, he began by telling me that a power which he should have got, and which it was promised should be sent after him from Madrid, had not been sent; that he had thus no authority, and had hitherto been acting upon his own credit, &c. I run over all this to you, though perhaps it should properly be addressed to Mr. Frere, but to you I can state it with more ease; and I shall thank you to speak to Frere upon it, when I hope he will have some serious communication with the Spanish ministers, and plainly tell them, if they expect the advance of the British army, they must pay somewhat more attention to its wants. Proper officers must be sent to me vested with full powers to call forth the resources of the country when they are wanted, and without delay, the same as is done, I presume, for the Spanish armies. We shall pay, but they are not to allow us to be imposed upon, but to tell us what is paid by the Spanish government in such cases. We find no difficulty with the people; they receive us everywhere well, but the authorities are backward, and not like those of a country who wish our assistance. With respect to magazines, it is impossible for me to say where they ought to be made. With respect to those at Madrid, it is very likely to be a proper place for Spain to collect a considerable depôt of various kinds. It is their capital, and they know best; but it does not seem to me to be a place where the British could be called upon to make any collection. We shall establish small magazines for consumption in the neighbourhood where we are acting. Those great resources which a country makes for general supply should be made by Spain, that when we approach them we may draw from them, and pay for what we get: but Spain should make them, and be at the expense and trouble of their conservation. As I believe we are giving money to Spain, part of it may be applied by them in this manner; but it is they that should do it, not we. I have no objection to you or Mr. Frere representing the necessity of as many more British troops as you think proper. It is certain that the agents which our government have hitherto employed have deceived them; for affairs here are by no means in the flourishing state they are represented and believed to be in England, and the sooner the truth is known there the better. But you must observe, my lord, that whatever is critical must now be decided by the troops which are here. The French, I suspect, are ready, and will not wait. I differ with you in

one point—when you say the chief and great obstacle and resistance to the French will be afforded by the English army: if that be so, Spain is lost. The English army, I hope, will do all which can be expected from their numbers; but the safety of Spain depends upon the union of its inhabitants, their enthusiasm in their cause, and their firm determination to die rather than submit to the French. Nothing short of this will enable them to resist the formidable attack about to be made upon them. If they will adhere, our aid can be of the greatest use to them; but if not, we shall soon be outnumbered, were our force quadrupled. I am, therefore, much more anxious to see exertion and energy in the government, and enthusiasm in their armies, than to have my force augmented. The moment is a critical one—my own situation is peculiarly so—I have never seen it otherwise; but I have pushed into Spain at all hazards. This was the order of my government, and it was the will of the people of England. I shall endeavour to do my best, hoping that all the bad that may happen will not happen, but that, with a share of bad, we shall also have a portion of good fortune.”

The despondency here expressed by the general was not lessened by the information he received in two days afterwards, that the French were not only in possession of Burgos, but also of Valladolid, within twenty leagues of Salamanca, where he now lay with only three brigades of infantry, and without a single gun; and though the remainder of his army was coming up as fast as possible, he was aware that the whole could not arrive in less than ten days. Instead of the Spanish army of 70,000 men that was to have joined him here, there was not so much as a single Spanish piquet to cover his front, or to act as guides in the country, of every portion of which the British army, both officers and men, were perfectly ignorant. Sir John Moore immediately communicated the intelligence to the junta of Salamanca, telling them that he must have the use of all the carts and mules in the country to transport his magazines to Ciudad Rodrigo should it become requisite, and that the troops with three days' provisions should be kept in readiness; but he added, that as he had not yet stopped the advance of the rest of the army from Portugal, he was desirous of assembling it there, and would not retire without an absolute necessity. All this was listened to with calm acquiescence. The general in the meantime found that though a patrol of horse had neared Valladolid, none of the French infantry had yet passed Burgos, and he gave orders to Generals Baird and Hope to advance upon Salamanca with all speed, but to be upon their guard on the march. The junta of Ciudad Rodrigo about this time ordered 20,000 dollars to be placed at his disposal, and a letter from Lord Castlereagh brought him intelligence that 2,000,000 of dollars had been despatched for him on the 2d of the month, and were already on the way to Corunna. His lordship at the same time told him that the scarcity of money in England was such, that he must not look for any further supply for some months, and advised him to procure as much money on the spot as possible. Encouraged so far by these advices, Sir John Moore continued to concentrate his forces at Salamanca, though upon what principle does not appear; for he seems to have been filled with the most dismal anticipations. “Every effort,” he says, writing to Lord Castlereagh on the 24th of November, “shall be exerted on my part, and that of the officers with me, to unite the army; but your lordship must be prepared to hear that we have failed; for, situated as we are, success cannot be commanded

by any efforts we can make, if the enemy are prepared to oppose us.” To add to all his other grounds of despondency, he considered Portugal as utterly indefensible by any force England could send thither. “If the French succeed in Spain, it will be in vain,” he says, in another letter to Lord Castlereagh, “to attempt to resist them in Portugal. The Portuguese are without a military force, and from the experience of their conduct under Sir Arthur Wellesley, no dependence is to be placed on any aid they can give. The British must in that event, I conceive, immediately take steps to evacuate the country. Lisbon is the only port, and therefore the only place whence the army with its stores can embark. Elvas and Almeida are the only fortresses on the frontiers. The first is, I am told, a respectable work. Almeida is defective, and could not hold out beyond ten days against a regular attack. I have ordered a depôt of provisions for a short consumption to be formed there, in case this army should be obliged to fall back; perhaps the same should be done at Elvas. In this case we might check the progress of the enemy whilst the stores were embarking, and arrangements were made for taking off the army. Beyond this, the defence of Lisbon, or of Portugal, should not be thought of.”

The news of Castanos being defeated having reached him on the 28th of November, he determined to fall back upon Portugal, and sent orders for General Hope to join him by forced marches, and for Sir David Baird to retreat upon Corunna; desiring the latter, however, to send back his stores, and keep his design, and the fact of his retreat, as much out of view as possible. He wrote to Lord Castlereagh on the 29th that he had so done, and requesting that transports might be sent to the Tagus to receive the troops, as he was still of opinion that Portugal was not defensible by a British army. On the 5th of December he wrote again to his lordship, that the junction of General Hope had been secured, and that Bonaparte had directed his whole force upon Madrid, in consequence of which he hoped to reach Portugal unmolested. The idea of a retreat, however, was exceedingly disagreeable to the army, and in this letter Sir John Moore gives his reasons for adopting such a measure at considerable length, and seems extremely anxious to justify it. He did not propose, however, wholly to desert the Spaniards; but he thought they might be aided upon some other point, and for this cause had ordered Sir David Baird to sail with his troops to meet the remainder of the army at the mouth of the Tagus, if he did not receive other orders from England. He had also written a long letter of the same kind, on the 1st of December, to Sir Charles Stuart at Madrid, in which he also requests that some money might be sent him from that place. “Such,” says he, “is our want of it, that if it can be got at a hundred per cent., we must have it; do, therefore, if possible, send me some at any rate.” To this letter Sir John Moore received an answer, softening down the defeat of Castanos, which was followed by a requisition on the part of the junta, military and civil, of all the united authorities of the kingdom, that he would move forward to the defence of Madrid, which was threatened by the enemy, and preparing to make the most determined defence. This was seconded by Mr. Frere, the British resident, and by another person who had been an eye-witness of the extraordinary effervescence at Madrid. Sir John Moore, in consequence of this, on the 5th of December, the same day that he had written to Lord Castlereagh, ordered Sir David Baird to suspend his march, and determined to wait in the position he occupied till

he should see further into the matter, and afterwards to be guided by circumstances. Sir David luckily had proceeded but a little way back, so that little time was lost. General Hope had brought up his division close to Salamanca, which made the little army complete, having both cavalry and artillery; and by a single movement to the left, Sir John Moore could make his junction with Sir David Baird a matter of certainty. Madrid, however, had capitulated on the 3d of the month, and was in the hands of the enemy two days before Sir John Moore had resolved to countermand the retreat. The intelligence upon which he had acted was, in fact, void of any real foundation; and the Prince of Castelfranco, and his excellency Don Thomas Morla, had already commenced a treaty for delivering up Madrid to the French, when they signed the pressing requisition of the junta to him to hasten to its relief.

Nothing could be more hopeless than the condition of the Spaniards at this time. Bessieres was driving the wretched remains of the centre army, as it was called, on the road to Valencia; Toledo was occupied by Belluno; the Duke of Dantzic, with a strong division, was on the road for Badajoz, with the design of seizing upon Lisbon or Cadiz. The Duke of Treviso was proceeding against Saragossa. The Duke of Dalmatia was preparing to enter Leon; and Bonaparte at Madrid was ready to second all their movements, together or separately, as events should require. It was in circumstances of which he was totally unaware that Sir John Moore found himself called upon to commence active operations. He was necessarily prevented from advancing upon Madrid by the knowledge that the passes of Somosierra and Guadarama were in the hands of the French; but having ordered Sir David Baird to advance, he himself moved forward to Toro, intending to unite with Sir David Baird at Valladolid. The object of this movement was to favour Madrid and Saragossa, by threatening to intercept the communication with France. On the 12th Lord Paget, with the principal part of the cavalry, marched from Toro to Tordesillas; while Brigadier-general Stuart, commanding the 18th and king's German dragoons, was moving from Arevalo. In his march, General Stuart, with a party of the 18th dragoons, surprised a party of French cavalry and infantry in the village of Reveda, and killed or made prisoners the whole detachment. This was the first encounter of the French and British in Spain—an earnest of what was yet to be there achieved by British skill and British valour. On the 14th the head-quarters of the army were at Alocjos, when, by an intercepted despatch, Sir John Moore was put in possession of the real state of affairs, with the objects which Bonaparte had in view, by despatching after him the Duke of Dalmatia, with whom he was already almost in contact. This intelligence determined the general, instead of going on to Valladolid, as was intended, to face about, and hasten to unite himself with the part of his army which was under Sir David Baird, and if possible to surprise the Duke of Dalmatia at Saldanha, before he should be further reinforced. Writing of his intended junction with Sir David Baird, to Lord Castlereagh, on the 16th, he adds, "If then Marshal Soult is so good as to approach us, we shall be much obliged to him; but if not, we shall march towards him. It will be very agreeable to give a wipe to such a corps, although, with respect to the cause generally, it will probably have no effect, Spain being in the state described in Berthier's letter. She has made no efforts for herself; ours came too late, and cannot, at any rate, be sufficient."

The armies were now near one another. The patrols of the cavalry reached as far as Valladolid, and had frequent and successful skirmishes with the enemy. On the 20th Sir John Moore formed a junction with Sir David Baird; the head-quarters of the army being at Majorga, but the cavalry and horse-artillery were at Monastero Milgar Abaxo, three leagues from Sahagun, where a division of the enemy's cavalry were posted. The weather was extremely cold, and the ground covered with snow, yet Lord Paget set out at two o'clock of the morning to surprise the French position. General Slade, with the 10th hussars, approached the town along the Cea, while his lordship, with the 15th dragoons and some horse-artillery, approached from another direction. Reaching the town by the dawn, they surprised a picket; but one or two escaping, gave the alarm, and enabled the enemy to form outside the town. The ground was at first unfavourable to the British, but the superior skill of Lord Paget overcame the difficulty. The French having wheeled into line, to receive the shock of the British charge, were overthrown in a moment, and dispersed in all directions. The 15th hussars, only 400 strong, encountered 700 French, and completely routed them. Many of the French were killed, and 157, including two lieutenant-colonels, were taken prisoners. Sir John Moore reached Sahagun on the 21st, where the troops were halted for a day, to recover the fatigue of the forced marches they had made. On the 23d every arrangement was completed for attacking the Duke of Dalmatia, who, after the defeat of his cavalry at Sahagun, had concentrated his troops, to the amount of 18,000, behind the river Carrion; 7000 being posted at Saldanha, and 5000 in the town of Carrion. Detachments were also placed to guard the fords and the bridges. The corps of Junot, Sir John Moore was aware, had also its advanced posts between Vittoria and Burgos. The spirit and the feeling under which he was now acting were not at all enviable. "The movement I am making," he writes, "is of the most dangerous kind. I not only risk to be surrounded every moment by superior forces, but to have my communication intercepted with the Galicias. I wish it to be apparent to the whole world, as it is to every individual of the army, that we have done everything in our power in support of the Spanish cause, and that we do not abandon it until long after the Spaniards had abandoned us." As already said, however, the preparations for attacking the Duke of Dalmatia were completed. The generals received their instructions, and the army, burning with impatience, was to march to the attack at eight o'clock in the evening. Unfavourable reports through the day, and a letter from the Marquis de la Romana confirming these reports, led to an opposite line of conduct. The march to the Carrion was countermanded, and immediate steps taken for retreating upon Astorga. This place the British army reached on the 28th, but greatly demoralized by the disappointment and hardships of the retreat. The advanced guard and the main body of the British army marched on the 30th for Villa Franca; Sir John Moore, with General Paget and the reserve, followed on the 31st. The cavalry reached Cambras at midnight, when the reserve proceeded, and arrived next morning, January 1, remaining at Bemblene, as the preceding divisions were marching off to Villa Franca. Here an unparalleled scene of debauchery presented itself. The stragglers from the preceding divisions so crowded the houses, that there was not accommodation for the reserve, while groups of the half-naked wretches belonging to the Marquis of Romana completed the confusion. The

French were following so close, that their patrols during the night fell in with the cavalry piquets. When Sir John Moore, with the reserve and the cavalry, marched for Villa Franca, on the 2d of January, he left Colonel Ross, with the 20th regiment and a detachment of cavalry, to cover the town; while parties were sent to warn the stragglers, amounting to 1000 men, of their danger, and to drive them if possible out of the houses. Some few were persuaded to move on, but the far greater number, in despite of threats, and regardless of the approaching enemy, persisted in remaining, and were therefore left to their fate. The cavalry, however, only quitted the town on the approach of the enemy, and then, from the sense of immediate danger, was the road filled with stragglers, armed and unarmed, mules, carts, women and children, in the utmost confusion. The patrol of hussars which had remained to protect them, was now closely pursued for several miles by five squadrons of French cavalry, who, as they galloped through the long line of stragglers, slashed them with their swords, right and left, without mercy, while, overcome with liquor, they could neither make resistance nor get out of the way. At Villa Franca the general heard with deep regret of the irregularities which had been committed by the preceding divisions. Magazines had been plundered, stores of wine broken open, and large quantities of forage and provisions destroyed. One man who had been detected in these atrocities was immediately shot; and a number of the stragglers, who had been miserably wounded by the French cavalry, were carried through the ranks, to show the melancholy consequences of inebriety and the imprudence of quitting their companions.

Failing in his aim of intercepting the British at Astorga, Bonaparte did not proceed farther, but he ordered Soult with an overwhelming force to pursue and drive them into the sea; and on the 3d of January they pressed so hard upon the rear of the retreating army, that Sir John Moore resolved upon a night march from Villa Franca to Herrerias. From the latter place he proceeded to Lugo, where he determined to offer the enemy battle; and for this purpose he sent forward despatches to Sir David Baird, who was in front, to halt. He also inclosed the same orders for Generals Hope and Frazer, who commanded the advanced divisions. These he forwarded to Sir David Baird by his aid-de-camp Captain Napier, accompanied by an orderly dragoon. Sir David again forwarded them to the respective officers; but the orderly dragoon, having got intoxicated, lost them; in consequence of which General Frazer marched on a day's journey on the road to Vigo, which he had to counter-march next day in dreadful weather, by which he lost a number of his men. It was now determined to march upon Corunna as being nearer than Vigo; and an express was sent off to Sir Samuel Hood, to order the transports round to that place. On the road to Nables the reserve fell in with forty waggons with stores sent from England for the Marquis of Romana's army. As there were no means of carrying them back, shoes, and such things as could be made use of, were distributed to the troops as they passed, and the rest destroyed. On the 5th the rifle corps, which covered the reserve, was engaged with the enemy nearly the whole day, while everything that retarded the march was destroyed. Two carts of dollars, amounting to £25,000, were rolled down a precipice on the side of the road, which the advanced guard of the French passed in less than five minutes thereafter. It was afterwards ascertained that this money fell into the hands of the Spanish peasants. At Lugo another

severe general order was issued, and a position taken up for battle. The French made an attack on part of this position on the 7th, but were repulsed with ease. On the 8th everything was disposed for a general engagement; Soult, however, did not think fit to make the attack, and the British army not being now in a state to undergo a protracted warfare, it was resolved to continue the retreat. The different brigades accordingly quitted the ground about ten o'clock at night, leaving their fires burning to deceive the enemy. Great disorders still reigned among the troops, who were suffering dreadfully from the severity of the weather, and from long marches on bad roads: yet at Bitanzos it was judged preferable to keep the troops exposed to the cold and rain rather than to the irresistible temptations of the wine-houses in the town. Here a new order was issued, and particular duties demanded to be performed by the officers. The last day's march on the 11th was conducted with more propriety than any that had preceded it; yet eight or nine stragglers were detected, who had preceded their column, and taken possession of a wine-house, and all that was in it. They were seized and brought before the general, who halted the army, and sent for the officers of the regiments to which they belonged. The culprits' haversacks were then searched, when the general declared that, had he found any plunder in them, their owners would have been hanged; but that he would have considered their guilt in a great measure attributable to the negligence of their officers.

On finishing this inquiry Sir John Moore rode on to Corunna, and examined every position in its neighbourhood. The troops were quartered, partly in the town, and partly in the suburbs; General Paget with the reserve at El-Burgo, near the bridge of the Moro, and in the villages on the St. Jago road. Adverse winds had detained the transports, otherwise the whole army would have been embarked before the enemy could have come up. Only a few ships lay in the harbour, in which some sick men, and some stragglers who had preceded the army and represented themselves sick, had embarked. The army, though much fatigued, arrived at its destined position unbroken, and in good spirits. Bonaparte, with 70,000 men, had in vain attempted to impede its progress; and its rear-guard, though often engaged, had never been thrown into confusion. But the greatest danger was still to be incurred. The situation of Corunna was found to be unfavourable; the transports had not arrived; the enemy was already appearing on the heights, and might soon be expected in overwhelming force. Several of his officers, recollecting perhaps the convention of Cintra, gave it as their advice that Sir John Moore should apply to the Duke of Dalmatia for permission to embark his troops unmolested. This, however, he positively rejected. The officers, in the first place, were busied in attempting to restore some degree of discipline among the troops, and in providing such refreshments for them as the place would afford. The ground, in the meantime, was carefully examined, and the best dispositions that could be thought of made for defence. On the 13th Sir John Moore was on horseback by the break of day, making arrangements for battle. He returned about eleven worn out with fatigue; sent for Brigadier-general Stuart, and desired him to proceed to England, to explain to ministers the situation of the army. He was, he said, so tired, that he was incapable of writing; but that he (General Stuart), being a competent judge, did not require any letter. After taking some refreshment, however, and resting two hours, the ship not being quite ready, nor

General Stuart gone, he called for paper and wrote his last despatch. On the 14th the French commenced a cannonade on the left, which the British returned with such effect as to make the enemy draw off. On a hill outside the British posts were found this day 5000 barrels of gunpowder, which had been sent from England, and lay here neglected, though the Spanish armies were in a great measure ineffective for want of ammunition. As many barrels as conveyance could be found for, which was but very few, were carried back to Corunna; the remainder were blown up. The explosion shook the town of Corunna like an earthquake. This evening the transports from Vigo hove in sight. On the 15th the enemy advanced to the height where the magazine had been blown up; and Colonel Mackenzie of the 5th regiment, in attempting to seize upon two of the enemy's guns, was killed. The artillery was this day embarked, with the exception of seven six-pounders and one howitzer, which were employed in the lines of defence, and four Spanish guns kept as a reserve. On this and the preceding day, the sick, the dismounted cavalry, horses, and artillery, were carried on board the ships, and every arrangement was made for embarking the whole army on the following evening. Next morning the enemy remained quiet, and the preparations being completed, it was finally resolved that the embarkation should take place that evening, and all the necessary orders were accordingly issued. About noon, Sir John Moore sent for Colonel Anderson, to whom the care of the embarkation was confided, and ordered him to have all the boats disengaged by four o'clock, as, if the enemy did not move, he would embark the reserve at that hour, and would go out himself as soon as it was dark, and send in the troops in the order he wished them to be embarked. At one o'clock his horse was brought, when he took leave of Anderson, saying, "Remember, I depend upon your paying particular attention to everything that concerns the embarkation, and let there be as little confusion as possible." Mounting his horse he set out to visit the outposts, and to explain his designs to his officers. On his way he was met by a report from General Hope, that the enemy's line was getting under arms, at which he expressed the highest satisfaction; but regretted that there would not be daylight enough to reap all the advantages he anticipated. Galloping into the field, he found the piquets already beginning to fire on the enemy's light troops, which were pouring down the hill. Having carefully examined the position and the movements of the armies, he sent off almost all his staff-officers with orders to the different generals, and hastened himself to the right wing, the position of which was bad, and which if forced would have ruined his whole army. This dangerous post was held by the 4th, 42d, and 50th regiments. As the general anticipated, a furious attack was made on this part of his line, which he saw nobly repelled by the 50th and 42d, whom he cheered on in person, calling out to them to remember Egypt. Having ordered up a battalion of the Guards, Captain Hardinge was pointing out to him their position, when he was beat to the ground by a cannon-ball, which struck him on the left shoulder, carrying it entirely away, with part of the collar-bone. Notwithstanding the severity of the wound, he sat up, with an unaltered countenance, looking intently at the Highlanders, who were warmly engaged; and his countenance brightened when he was told that they were advancing. With the assistance of a soldier of the 42d, he was removed a few yards behind the shelter of a wall; Colonel Graham of Balgowan, and Captain Woodford, coming up at the instant,

rode off for a surgeon. Captain Hardinge, in the meantime, attempted to stop the blood, which was flowing in a torrent, with his sash; but this, from the size of the wound, was in vain. Having consented to be carried to the rear, he was raised up to be laid in a blanket for that purpose. His sword hanging on the wounded side seemed to annoy him, and Captain Hardinge was unbuckling it from his waist when he said with a distinct voice, "It is as well as it is, I had rather it should go out of the field with me." He was borne out of the field by six soldiers of the 42d. Captain Hardinge remarking, that he trusted he would yet recover, he looked steadfastly at the wound and said, "No, Hardinge, I feel that to be impossible." When this officer expressed a wish to accompany him, he said, "You need not go with me. Report to General Hope that I am wounded, and carried to the rear." A sergeant of the 42d and two spare files escorted the general to Corunna, while Captain Hardinge hastened to carry his orders to General Hope.

The following is his friend Colonel Anderson's account of his last moments. "I met the general in the evening of the 16th, bringing in, in a blanket and sashes; he knew me immediately, though it was almost dark; squeezed my hand, and said, 'Anderson, don't leave me.' He spoke to the surgeons while they were examining his wound, but was in such pain he could say little. After some time he seemed very anxious to speak to me, and at intervals expressed himself as follows: 'Anderson, you know that I have always wished to die this way.' He then asked, 'Are the French beaten?' a question which he repeated to every one he knew as they came in. 'I hope the people of England will be satisfied. I hope my country will do me justice. Anderson, you will see my friends as soon as you can. Tell them everything. My mother'—here his voice quite failed, and he was excessively agitated. 'Hope—Hope—I have much to say to him—but—cannot get it out. Are Colonel Graham and all my aids-de-camp well? [A private sign was made by Colonel Anderson not to inform him that Captain Burrard, one of his aids-de-camp, was wounded.] I have made my will, and remembered my servants. Colborne has my will and all my papers.' Major Colborne then came into the room. He spoke most kindly to him, and then said to me, 'Anderson, remember you go to —, and tell him it is my request, and that I expect he will give Major Colborne a lieutenant-colonelcy. He has been long with me, and I know him most worthy of it.' He then asked Major Colborne if the French were beaten; and on being told that they were on every point, he said, 'It is a great satisfaction for me to know we have beaten the French. Is Paget in the room?' On my telling him that he was not, he said, 'Remember me to him; it's General Paget I mean. He is a fine fellow. I feel myself so strong, I fear I shall be long dying. It is great uneasiness—it is great pain. Everything Francois says is right. I have the greatest confidence in him.' He thanked the surgeons for their trouble. Captains Percy and Stanley, two of his aids-de-camp, then came into the room. He spoke kindly to both, and asked if all his aids-de-camp were well. After some interval he said, 'Stanhope, remember me to your sister.' He pressed my hand close to his body, and in a few minutes died without a struggle."

Thus died Sir John Moore, in the forty-seventh year of his age, after having conducted one of the most difficult retreats on record, and secured the safety of the army intrusted to him. Few deaths have excited a greater sensation at the time they took

place. The House of Commons passed a vote of thanks to his army, and ordered a monument to be erected for him in St. Paul's Cathedral. Glasgow, his native city, erected a bronze statue to his memory, at a cost of upwards of £3000. The extent of his merits has not failed to be a subject of controversy; but it seems to be now generally allowed by all, except those who are blinded by party zeal, that, in proportion to the means intrusted to him, they were very great.

"Succeeding achievements of a more extensive and important nature," says the author of the *Pleasures of Hope* [Edin. Encyc. art. "Sir John Moore"], "have eclipsed the reputation of this commander, but the intrepidity and manly uprightness of his character, manifested at a time when the British army was far from being distinguished in these respects, are qualities far more endearing than military fame. They extorted admiration even from his enemies; and the monument erected by the French officers over his grave at Corunna attests the worth of both parties."

MORAY, EARL OF. *See* RANDOLPH (THOMAS).

MORAY, REGENT. *See* STUART (JAMES).

MORISON, ROBERT, an eminent botanist of the seventeenth century, was born at Aberdeen in the year 1620. He completed his education in the university of that city, and in 1638 took the degree of Doctor in Philosophy. He was originally designed by his parents for the church, but his own taste led him to the study of botany and physic; and his attachment to those sciences finally prevailing over every other consideration, he began to follow them as a profession. His attachment to the royal cause induced him to take an active part in the political disturbances of his times. He was present at the battle of the Bridge of Dee, near Aberdeen, and was severely wounded in that engagement. On his recovery he went to Paris, where he obtained employment as a tutor to the son of counsellor Brizet; but at the same time he zealously devoted himself to the study of botany, anatomy, and zoology.

In 1648 he took a doctor's degree in physic at Angers; and now became so distinguished by his skill in botany, that, on the recommendation of Mr. Robins, king's botanist, he was taken into the patronage of the Duke of Orleans, uncle to Louis XIV., and appointed, in 1650, intendant of the ducal gardens at Blois, with a handsome salary. In this situation he remained till the duke's death, which took place in 1660. While employed in the capacity of intendant, Morison discovered to his patron, the Duke of Orleans, the method of botany which afterwards acquired him so much celebrity. The latter, much pleased with the ingenuity and talent which it displayed, afforded its discoverer every encouragement to prosecute it to completion; and sent him, at his own expense, through various provinces of France, to search for new plants, and to acquire what other information such an excursion might afford. On this occasion Morison travelled into Burgundy, Lyonnais, Languedoc, and Brittany, carefully investigated their coasts and isles, and returned with many rare and some new plants, with which he enriched the garden of his patron.

On the death of the Duke of Orleans he was invited to England by Charles II., who had known him while he was in the service of Orleans. His reputation, however, as a botanist, now stood so high, that he was considered as a national acquisition, and was earnestly solicited by Fouquet to re-

main in France, who, to induce him to comply, made him an offer of a handsome settlement. But love of country prevailed, and he returned to England. On his arrival Charles bestowed on him the title of king's physician, and appointed him royal professor of botany, with a salary of £200 per annum, and a free house as superintendent of botany. He was shortly afterwards elected fellow of the Royal College of Physicians, and daily became more and more celebrated for his knowledge of botany. In the situations to which he was appointed by the king he remained till 1669, when he was elected, through the interest of the leading men of the university of Oxford, botanic professor of that institution, on the 16th December of the year above named; and on the day following was incorporated Doctor of Physic. Here he read his first lecture in the physic school, in September, 1670, and then removed to the physic garden, where he lectured three times a week to considerable audiences.

This appointment he held, occasionally employing himself besides on his great work *Historia Plantarum Oxoniensis*, till his death, which took place on the 9th November, 1683, in consequence of an injury which he received from the pole of a carriage, as he was crossing a street. He died on the day following the accident at his house in Green Street, Leicester Fields, and was buried in the church of St. Martin's-in-the-Fields, Westminster.

Morison's first publication was a work entitled "*Hortus Regius Elesensis auctus; accessit Index Plantarum in Horto Contentarum, nomine Scriptorum et Observationes Generaliores, seu Præliudiorum pars prior*, London, 1669," 12mo. This work added greatly to his reputation, and was the means of recommending him to the professorship at Oxford. His next publication was, "*Plantarum Umbelliferarum Distributio Nova, per Tabulas Cognationis et Affinitatis, ex Libro Naturæ observata et electa*, Oxon. 1672," fol. This was given as a specimen of his great work, *Historia Plantarum Universalis Oxoniensis*. It attracted the notice of the learned throughout all Europe, and added greatly to his reputation. Encouraged by its reception, he proceeded vigorously with the work which it was intended to typify, and produced the first volume, under the title already quoted, in 1680. His death, however, prevented its completion, and left him time to finish nine only of the fifteen classes of his own system.

MORTON, EARL OF. *See* DOUGLAS (JAMES).

MOTHERWELL, WILLIAM. This poet, antiquary, and journalist, was born at Glasgow, on the 13th of October, 1797, and was the third son of William Motherwell, an ironmonger in that city. His education, owing to family movements, was received partly in Edinburgh, and afterwards in Paisley, but was brought to a close at the age of fifteen, when he was placed as clerk in the office of the sheriff-clerk of Paisley. During so brief a training in literature he was distinguished merely as an active, clever boy; but independently of school lessons, he had already prepared himself for his future career by his aptitude in copying and imitating old MSS., and by writing verses. The object of his early poetical inspiration was Jeanie Morrison, a beautiful young girl, who attended with him the same school in Edinburgh, and sat with him on the same form, according to the fashion of teaching at that period, even in our metropolis. The exquisite song in which he commemorated this fair theme of his youthful enthusiasm, and whom he never afterwards forgot, would have reached a higher

celebrity than it has ever attained, had there not been a *Mary in Heaven*.

After William Motherwell had completed his apprenticeship, he was appointed, at the early age of twenty-one, sheriff-clerk depute of the county of Renfrew, an office that brought him a considerable income. But it was also fraught with no little danger, on account of the Radical commotions of that manufacturing district, where every weaver, under the enlightenment of Paine and Colbette, was persuaded that all things were wrong both in church and state, and that there was no remedy except a universal subversion. With this turbulent spirit Motherwell was often brought into perilous contact, from being obliged by his office to execute the unpalatable behests of law; and on one of these occasions, in 1818, he was assailed by a frantic mob, who hustled him to the parapet of the bridge across the Cart, with the intention of throwing him into the river. Up to this period, like most young men of ardent poetical temperament, he had dreamed his dream of liberty, but such rough handling was enough to extinguish it, and he settled down into a Conservative.

While he was thus compelled by duty to issue ungracious writs, prepare copies of the riot act, and occasionally wield the truncheon of a constable in the disturbed streets of Paisley, William Motherwell steadily pursued those literary occupations upon which his claims to public notice were founded. He enlarged his reading, until his library was stored with a miscellaneous but rich collection, in which antique works predominated, especially those connected with poetry, romance, and the old Runic mythology. He also wrote pieces in prose and verse, which he readily bestowed upon his friends; and was, so early as 1818, a contributor to a small work published at Greenock, called the *Visitor*. He edited the *Harp of Renfrewshire*, containing biographical notices of the poets of that district from the 16th to the 19th century, which was published in 1819. This work was but the prelude to one of greatly higher importance, which he published in Glasgow in 1827, under the title of *Minstrelsy, Ancient and Modern*, in which his researches into Scottish antiquarianism were turned to best account. In 1828 he commenced the *Paisley Magazine*, the pages of which he enriched with some of his best poetical productions; and during the same year he succeeded to the editorship of the *Paisley Advertiser*, a Conservative newspaper, previously under the management of his friend William Kennedy, author of *Fifful Fancies*. As Motherwell had now acquired considerable reputation, not only as a poet, but political journalist, this last step was followed by one more important two years afterwards. The *Glasgow Courier* having lost the able superintendence of Mr. James M^cQueen, its proprietors applied to Motherwell, who closed with their proposals, and became editor of the *Courier* in February, 1830, an office in which he continued till his death, nearly six years after.

However profitable this change might have appeared in a pecuniary point of view, or even as an opportunity of acquiring higher literary distinction, it is certain that the result was far from being favourable. Motherwell's knowledge of general, and especially of modern history, was defective, owing to his exclusive love of antiquarianism; and his habits of composition, from the scantiness of his early training, were irregular, slow, and laborious. But thus imperfectly equipped, he was obliged, as editor of the *Glasgow Courier*, to step forth as the champion of Toryism in a locality where Toryism was at a mercantile discount, and at a period when the tide of

public events throughout Europe was rushing in an opposite direction. In a newspaper that was issued three times a week, and at a season when every throne was overturned or rudely shaken, he found it equally impossible to command his attention to every scene of action, and his temper upon every variety of subject; and although he bore up and fought gallantly, so as to command the approval of both friends and enemies, the termination, in an overworn intellect and premature death, was nothing more than a natural penalty. Such was the result, on the 1st of November, 1835, when he was suddenly struck with apoplexy in bed, at four o'clock in the morning, and expired four hours after, at the early age of thirty-eight, although his robust frame, active habits, and happy temperament promised a healthy longevity. He was buried in the Glasgow Necropolis, while the persons of every class of political opinion who attended the funeral, betokened the general esteem in which he was held, and the regret that was felt on account of his departure.

During his short life of toil in Glasgow, Motherwell was not wholly occupied with his editorial duties; his devotedness to poetry continued unabated, and although he found little time for new productions, he was a considerable contributor to the *Day*, a periodical conducted in Glasgow by Mr. John Strang. He also joined with the Ettrick Shepherd in preparing an edition of Burns' works, but which he did not live to see completed. In addition to these he left unfinished at his death a prose collection of Norse legends, said to be of great power and beauty, and materials for a life of Tamahill. It is as a poet, however, that Motherwell will continue to be best known and distinguished; and of his larger productions, his ballads of the *Battle-flag of Sigurd*, and the *Sword Chant of Thorstein Raudi*, fully attest his ability in the wild and stirring runes of the north; while his songs of *My Heid is like to rend, Willie*, the *Midnight Wind*, and above all, *Jeanie Morrison*, will make those who read them regret that he did not throw journalism to the dogs, and become wholly and devotedly a song-writer. Indeed, it has been well said of him, by no less a critic than Professor Wilson:—"All his preceptions are clear, for all his senses are sound; he has fine and strong sensibilities, and a powerful intellect. . . . His style is simple, but in his tenderest movements masculine; he strikes a few bold knocks at the door of the heart, which is instantly opened by the master or mistress of the house or by son or daughter, and the welcome visitor at once becomes one of the family."

MUDIE, ROBERT. This model of industry and perseverance, the author of so many volumes, and writer on such a variety of subjects, was one of those persons born in humble life, and almost entirely self-taught, who have raised themselves to a high place among the literary and scientific men of the age. He was the youngest child of John Mudie, a common country weaver, and was born about the year 1781 at a place about six or seven miles north-east of Dundee. After having been a short time at the parish school, he left it in very early youth to learn his father's humble occupation, and plied the shuttle for several years, until, on being drawn for the militia, he was for four years a citizen soldier. But even in boyhood his desire of knowledge resembled the voracity of starvation, so that whether he wrought at the loom or handled the musket, every hour and minute of intermission was employed in the reading of books. It was better still that what he read he remembered, and could use with a ready mastery. "He used to mention that before he left home a gen-

GENERAL SIR JOHN BURNES, K.C.B.

GOVERNOR OF MADRAS

SCULPTED BY J. G. THOMAS

tleman had lent him some volumes of the *Encyclopædia Britannica*, in which he indulged at large his taste for variety, and that in the towns where his regiment was stationed he always contrived to find a good supply of books."¹ At the expiration of his four years' term of militia service he had so fully educated himself, and acquired such an amount and variety of knowledge, that he was emboldened to become teacher of a village school in the south of Fife; but indeed, his apprehension was so quick, his memory so tenacious, and his acquired knowledge so multifarious, that he was already qualified for a much greater attempt. We are informed by Dr. Duncan, that "besides other accomplishments, he had acquired considerable skill in the art of drawing, a respectable acquaintance with arithmetic and mathematics, and great facility in English composition. He also wrote verses with ease." These endowments soon obtained for him the situation of drawing-master in the academy of Inverness, and afterwards in that of Dundee, in which last place he was soon transferred to the more intellectual duties of teaching arithmetic theoretical and practical, and English composition.

At this time Mudie enjoyed the acquaintance of the Rev. Thomas Chalmers, then the almost unknown minister of Kilmany, but afterwards of such world-wide reputation; and out of this acquaintance originated the following ludicrous adventure, which is best told in the words of Dr. Hanna: "In the course of this autumn [of 1811] Mr. Chalmers' capacity for housekeeping, of which he was himself so confident, was extensively tried. In prospect of her approaching marriage, his sister Jane, who was his favourite housekeeper, had gone to Anstruther, and left him for a month or two in entire solitude at the manse. He was the sole manager of his domestic establishment when Mr. Duncan and Mr. Mudie came in upon him from Dundee. Retiring shortly after they made their appearance, in order to hold a private consultation as to the important article of dinner, he found, to his dismay, that there was nothing whatever in the house but two separate parcels of salt fish. Having given particular directions that a portion of each should be boiled apart from the other, he joined his friends, and went out to enjoy the brilliant day and the pleasant sight of the hunting-field. They returned to the manse with racy appetites; the dinner was served—two large and most promising covered dishes flourishing at the head and foot of the table. 'And now, gentlemen,' said the host, as the covers were removed, 'you have variety to choose among: that is hard fish from St. Andrews, and this is hard fish from Dundee.'"

Mr. Mudie remained for ten or twelve years a teacher in Dundee, but such a restricted occupation was not enough for him; he therefore contributed largely to a local newspaper, conducted for some time a monthly periodical, and published in 1819 a novel, in three volumes, entitled *Glenfergus*. He was also a member of the town-council; and, like most young literary men at their outset into public life, he was an ardent reformer, and distinguished himself in the fierce controversies of borough reform. But the satirical power and keenness of his pen sorely disquieted the peaceful community of Dundee, and raised him many enemies. In 1820 he left Dundee for London, where he became wholly a *littérateur*, and was engaged as reporter to the *Morning Chronicle*, in which capacity he came to Edinburgh during the memorable visit of George IV. to Scotland. Here Mr. Mudie not only chronicled the principal events in the Scottish capital during that occasion, but

wrote *Modern Athens*, a work descriptive of Edinburgh society and manners, written with his wonted vigour of style, and a double portion of his sarcastic severity. He afterwards published *Babylon the Great*, a picture of men and things in London, written in a similar strain. He was now wholly the property of London publishers, writing books on whatever subject they demanded; and such was the readiness and versatility of his genius, and the universal character of his knowledge, that he was prepared for every theme. In this way he was the author of upwards of ninety volumes; while such was the rapidity of his pen, that he was known, it is said, to have written a whole volume on some scientific subject in the brief space of eight days. But the productions themselves indicated neither haste nor carelessness; on the contrary, they showed large and accurate knowledge, deep reflection, and methodical arrangement, embodied in a careful and correct, and often a vigorous and happy, style. Of the many works he thus produced we cannot find room for even the titles; it is enough to state that they were connected with every department of natural, moral, and metaphysical science. He also wrote largely for newspapers and magazines, sometimes as editor, sometimes as contributor, and in 1840 he was editor of the *Surveyor, Engineer, and Architect*, a monthly journal, which however did not last a full year. One might think that such talent and such industry would have sufficed to secure a competent portion of the good things of this life, if not an absolute fortune; but instead of this, Mr. Mudie was always poor, and his improvident habits prevented the possibility of his becoming rich. Worn out at last by poverty and intellectual drudgery, aided by intemperate habits, which had made him old before his day, he died at Pentonville on the 29th of April, 1842, in very destitute circumstances, leaving behind him a widow, and one son and four daughters.

MUNRO, MAJOR-GENERAL SIR THOMAS, Bart. and K.C.B., a celebrated civil and military officer in the service of the East India Company, was the son of Mr. Alexander Munro, an eminent merchant in Glasgow, where the subject of this memoir was born on the 27th May, 1761. His mother, whose name was Stark, was descended of the Starks of Killermont, and was sister to Dr. William Stark, the distinguished anatomist. After going through the usual routine of juvenile education, including the established term of attendance at the grammar-school, young Munro was entered a student in the university of his native city in the thirteenth year of his age. Here he studied mathematics under Professor Williamson, and chemistry with the celebrated Dr. Irvine; and in both sciences made a progress which excited the admiration of his teachers.

While at school he was distinguished for a singular openness of temper, a mild and generous disposition, with great personal courage and presence of mind. Being naturally of a robust frame of body, he excelled all his school-fellows in athletic exercises, and was particularly eminent as a boxer; but, with all that nobleness of nature which was peculiar to him, and which so much distinguished him in after-life, he never made an improper or unfair use of his superior dexterity in the pugilistic art. He studiously avoided quarrels, and never struck a blow except under circumstances of great provocation. Neither did he ever presume so far on the formidable talent which he possessed as to conduct himself with the slightest degree of insolence towards his companions, although none of them could stand an instant before him in single combat. These qualities secured

¹ Dr. Duncan, in *Life of Dr. Chalmers*. Appendix, vol. i.

him at once the respect and esteem of his youthful contemporaries, and on all expeditions and occasions of warfare procured him the honour of being their leader and military adviser.

Having remained three years at college, he was at the expiry of that period placed by his father in the counting-house of Messrs. Somerville and Gordon, being designed for the mercantile profession. He was about this time also offered a lieutenantancy in a military corps, then raising by the city of Glasgow for the public service; but, though himself strongly disposed to accept this offer, his father objected to it, and, in compliance with the wish of his parent, he declined it. Soon after this his father's affairs became embarrassed, when, finding it impossible to establish his son in business as he had originally proposed, he began to think of putting him in a way of pushing his fortune in India; and with this view procured him the appointment of midshipman on board the East India Company's ship *Walpole*, Captain Abercrombie. With this vessel young Munro sailed from London on the 20th February, 1779. Previously to sailing, his father, who happened to be accidentally in London at the time, procured him a cadetship through the influence of Mr. Laurence Sullivan, one of the directors of the Company.

Mr. Munro arrived at Madras, the place of his destination, on the 15th January, 1780. Here he was kindly received by the numerous persons to whom he brought letters of introduction; but kindness of manner and the hospitality of the table seem to have been the extent of their patronage. He was left to push his own way, and this, on his first landing, with but very indifferent prospects for the future, and but little present encouragement. Nor were these disheartening circumstances at all ameliorated by the reception he met with from his namesake, Sir Hector Munro, the commander-in-chief. That high functionary told him "that he would be happy to serve him, but was sorry it was not in his power to do anything for him." He was soon after his arrival, however, called into active service against the forces of Hyder Ali, and continued thus employed, with scarcely any intermission, for the next four years, when a definitive treaty of peace was entered into with Tippoo Sultan. During this period of warfare he was present at four battles, and at more than double that number of sieges, assaults, and stormings; in all of which he evinced an intrepidity, presence of mind, and military genius, which early attracted the notice of his superiors, by whom he began to be looked upon as an officer of singular promise. In February, 1786, he was promoted to a lieutenantancy; but no further change took place in his fortunes till August, 1788, when he was appointed assistant in the intelligence department under Captain Alexander Read, and attached to the head-quarters of the force destined to take possession of the province of Guntow.

During the interval between the first and last periods just named, Mr. Munro assiduously employed himself in acquiring the Hindostanee and Persian languages, in which he ultimately made a proficiency which has been attained by but few Europeans. In this interval, too, occurred a correspondence with his parents, in which are certain passages strikingly illustrative of the generosity of his nature, and which it would be doing an injustice both to his memory and to the filial piety of his brother, to pass without notice. In one of these letters, dated Tanjore, 10th November, 1785, addressed to his mother, he says, "Alexander and I have agreed to remit my father £100 a year between us. If the arrears which Lord Macartney detained are paid, I will send £200 in

the course of the year 1786." When it is recollected that Mr. Munro was yet but a lieutenant, this proof of his benevolence will be fully appreciated. It must also be added that these remittances were made at a time, too, when he had himself scarcely a chair to sit upon. "I was three years in India," he writes to his sister, "before I was master of any other pillow than a book or a cartridge-pouch; my bed was a piece of canvas stretched on four cross-sticks, whose only ornament was the greatcoat that I brought from England, which, by a lucky invention, I turned into a blanket in the cold weather by thrusting my legs into the sleeves, and drawing the skirts over my head."

In the situation of assistant-intelligencer he remained till October, 1790, when, Tippoo having resumed hostilities with the English, he returned to his military duties, by joining the 21st battalion of native infantry, which formed part of the army under the command of Colonel Maxwell. Mr. Munro remained with the army, sharing in all its dangers and fatigues, and performing the various duties assigned to him with his usual diligence and activity, till the month of April, 1792, when he was appointed to assist Captain Read in the management of the district of Barmahul. In this employment he continued till March, 1799, having in the meantime, June, 1796, attained the rank of captain; when, on a war with Tippoo again occurring, he joined the army under Lieutenant-general Harris, and served in it with his accustomed ability and zeal, until after the siege of Seringapatam and death of Tippoo, when he was appointed to the charge of the civil administration of Canara. This charge was an exceedingly laborious one, and in almost every respect an exceedingly unpleasant one; but the circumstance of his appointment to it was nevertheless a very marked proof of the high estimation in which his talents were held by the government, for it was also a charge of great importance; and the authorities did justice to his merits, by believing that there was no individual in India so well qualified to fill the situation as Captain Munro. The principal duties of his new appointment were to introduce and establish the authority of the government; to settle disputes amongst the natives; to punish the refractory; and to watch over the revenues of the district: and from twelve to sixteen hours were daily devoted to this oppressive and harassing routine of business.

Having accomplished all the purposes for which he was sent to Canara, and having established order and tranquillity where he had found turbulence and violence, Major Munro (for to this rank he was promoted, May 7, 1800) solicited the government to be intrusted with the superintendence of what were called the Ceded Districts; a certain extent of territory yielded up in perpetuity to the Company by Nizam, in lieu of a monthly subsidy which had been previously exacted from him. The request of Major Munro was not fulfilled without much reluctance and hesitation, proceeding from the high value placed upon his services where he was; but it appearing that these would be equally desirable in the situation which he sought, he was removed thither in October, 1800. Here he performed similar important services both to the country itself and to the Company as he had done at Canara. Within a few months after his arrival he cleared the province of numerous bands of marauders, which had previously kept it in a state of constant terror and alarm, and filled it with robbery and murder. He everywhere established order and regularity, and finally succeeded in converting one of the most disorderly provinces in India into one of the most secure and tranquil dis-

tricts in the possession of the Company. This, however, was not accomplished without much labour, and many personal privations. He repeatedly traversed the whole extent of territory under his jurisdiction, and for the first four years of his residence in it, never dwelt in a house, being continually in motion from place to place, and on these occasions making his tent his home.

During the time of his services in the Ceded Districts Mr. Munro was promoted, 24th April, 1804, to the rank of lieutenant-colonel.

With that filial affection which forms so remarkable and pleasing a feature in the character of the subject of this memoir, he had regularly increased the allowance to his parents with the advance of his own fortunes. Indeed, this seems to have been his first care on every occasion of an accession of income. In a letter to his father, dated Kalwapi, 3d May, 1801, there occurs this passage: "I have at last heard from Messrs. Harrington, Burnaby, and Cockburn on the subject of the remittance of a bill for £1000 sterling, to clear your house in the Stockwell. In August I shall remit the remaining sum due upon the house; and also £200 sterling, in order to augment my annual remittance to £400 sterling. As my mother is so fond of the country, and as a garden would probably contribute to her health, she ought certainly to be under no concern about the trifling expense a country-house may occasion, in addition to one in town. I therefore hope that you will draw on Colt for whatever it may cost, and let me know the amount, that I may add it to the £400, which I mean should go entirely to your town expenses; and that you will likewise inform me what other debts you may have besides the mortgage on the house, that I may discharge them, and relieve you at once from the vexation and anxiety to which you have so long been exposed." In a very few years afterwards we find him making another munificent contribution to the comfort and happiness of his parents by remitting them £2000 for the purchase of a country-house.

Colonel Munro retained his appointment in the Ceded Districts till the year 1807, when he came to the resolution of paying a visit to his native country. With this view he applied for and obtained permission to resign his situation; and after a few days spent in preparation, embarked, in October in the year above named, at Madras for England, leaving behind him, after a service of seven-and-twenty years, a reputation for talent, diligence, and exemplary conduct, both as a civil and military officer, which few in the same service had attained, and none surpassed. In the former capacity he had undertaken and accomplished more than any British functionary had ever done before him; and in the latter he had displayed a talent for military affairs, which all acknowledged to be of the very highest order. After an agreeable passage of nearly six months Colonel Munro arrived at Deal on the 5th April, 1808. From Deal he proceeded to London, where he was detained by some pressing business until the summer was far advanced. He then set out for Scotland, but not without some melancholy forebodings of the changes which he knew so great a lapse of time as seven-and-twenty years must have effected on the persons and things associated with his earliest and tenderest recollections. These anticipations he found on his arrival realized. That mother to whom he was so tenderly attached, and whose comfort and welfare had been a constant object of his solicitude, was no more. She had died about a year previous to his arrival. Two of his brothers were dead also, and many besides of the friends of his youth. The im-

becility of age had moreover come upon his only surviving parent, and had effected such a change, as to mar that reciprocity of feeling which their meeting, after so long a separation, would otherwise have excited.

On his return to Glasgow Colonel Munro revisited all the haunts of his youth, and particularly North Woodside, then a romantic spot in the vicinity of the city, where in his early days his father had a country residence, to which the family resorted every summer. Here, with all that simple and amiable feeling peculiar to generous natures, he endeavoured to annihilate the space of time which had elapsed since he had been there a boy, and to recall with increased force the sensations of his youth, by bathing in the dam in which he had sported when a boy, and by wandering through the woods where he had spent so many of the careless hours of that happy season. This feeling he even carried so far as to climb once more a favourite aged tree, which had enjoyed an especial share of his youthful patronage and affection. Every branch was familiar to him; for he had a thousand times nestled amongst them, to enjoy in solitude and quietness the pages of some favourite author.

Colonel Munro now spent a good deal of his time in Edinburgh, where he resumed his favourite study, chemistry, by attending the lectures of Dr. Hope, and by perusing such works on the subject as had appeared since he had left Europe. During his residence in Britain he took a lively interest in the Peninsular war, and was known to be in constant communication with the Duke of Wellington, who had become acquainted with him in the East, and who had there learned to appreciate his eminent abilities. About this time, also, he accompanied Sir John Hope to the Scheldt as a volunteer, and was present at the siege of Flushing.

The East India Company's charter now drawing to a close, and the question of the propriety of its renewal having attracted an extraordinary share of public attention, a parliamentary committee was appointed to inquire into and hear evidence on the subject, to enable the house to come to a decision regarding it. Many persons connected with India were in consequence examined on the affairs of that country, and amongst the rest the subject of this memoir; and such was the clearness of his evidence, the importance of the information which he gave, the comprehensiveness of his views, and the general talent and judgment which characterized all his statements, that the court of directors immediately placed him at the head of a commission of inquiry which they decided on sending out to India, to remedy those defects and abuses which the evidence now placed before them had brought to light.

Previous to his returning to India, Colonel Munro married, 30th March, 1814, Jane Campbell, daughter of Richard Campbell, Esq., of Craigie House, Ayrshire, a lady remarkable for her beauty and accomplishments. This connection added greatly to Colonel Munro's happiness, and eventually opened up to him a source of domestic felicity, which his disposition and temper eminently fitted him to enjoy.

His commission having now been duly made out, and all other preparations for his voyage completed, he embarked, accompanied by his wife and sister-in-law, in the month of May, 1814, at Portsmouth, and after a pleasant passage of eighteen weeks, arrived at Madras on the 16th September. On his arrival Colonel Munro immediately began to discharge the arduous duties of his new appointment. These embraced a total revision of the internal administration of the Madras territories, and comprehended an amount of labour, in going over reports and deci-

sions, in investigating accounts, in drawing up regulations, and in a thousand other details as numerous as they were complicated, which would have appalled any man of less nerve than him on whose shoulders it had fallen. In this laborious employment he continued till the month of July, 1817, when, a war with the Mahrattas having broken out, he solicited employment in the line of his profession, and was appointed to the command of the reserve of the army under Lieutenant-general Sir Thomas Hislop, having been himself previously, 15th June, 1815, promoted to the rank of colonel.

In the campaign which followed the resumption of his military duties Colonel Munro performed a brilliant part. His military reputation, formerly amongst the highest, was now universally acknowledged to be unsurpassed. Lord Hastings complimented him in strains of the warmest panegyric, as well in his official communications as in his private correspondence. Mr. Canning passed an eloquent eulogium on his merits in the House of Commons. Sir John Malcolm contributed his unqualified commendations of his masterly operations, and the public records of Calcutta were filled with his praise. His name was now, in short, become famous throughout Europe, and he was everywhere looked upon not only as one of the first soldiers of the day, but as a man who possessed talents and abilities which fitted him for attaining eminence equally in a civil as in a military life. During the campaign, which lasted till the beginning of August, 1818, General Munro (he was promoted to this rank, December, 1817) reduced all the Peishwah's territories between the Toombuddra and Kistna, and from the Kistna northward to Akloos on the Neemah, and eastward to the Nizam's frontier. On the conclusion of the campaign, finding his health greatly impaired by the excessive fatigue which he had undergone, he resolved to resign all his commissions, both civil and military, and to retire into private life. In pursuance of this resolution he tendered his resignations to the Marquis of Hastings, who received them with much reluctance; and returned by way of Bangalore, where he met his family, to Madras. Shortly after this, October, 1818, he was made a Companion of the Bath, as a testimony of the opinion which was entertained at home of his merits.

General Munro now again turned his thoughts homewards, and after devoting two months to the arrangement of his affairs, embarked on board the *Warren Hastings* with his family for England, on the 24th January, 1819. During the passage Mrs. Munro was delivered, 30th May, of a boy, who, being born when the ship was in the latitude of the Azores, was baptized by that name. The *Warren Hastings* having arrived in the Downs, General and Mrs. Munro landed at Deal, and proceeded to London, where they remained for a short time, and thereafter set out for Scotland. The former, however, was only a few weeks at home when he received a formal communication from the government, appointing him to the governorship of Madras, and he was soon after, October, 1819, promoted to the rank of major-general, and invested, November, 1819, with the insignia of K.C.B. Although extremely reluctant again to leave his native country, Sir Thomas did not think it advisable to decline the acceptance of the high and honourable appointment now proffered him. Having committed their boy to the charge of Lady Munro's father, Sir Thomas and his lady proceeded to Deal, where they once more embarked for India in December, 1819, and arrived safely at Bombay in the beginning of May in the following year. Here they remained for about

a fortnight, when they again took shipping, and on the 8th June reached Madras.

Sir Thomas, immediately on his arrival, entered on the discharge of the important duties of his new appointment with all the zeal and diligence which marked every part of his preceding career. These duties were extremely laborious. From sunrise till eight in the evening, with the exception of an hour or two at dinner, comprising a little out-door recreation after that repast, he was unremittingly employed in attending to and despatching the public business of his department. With this routine the morning meal was not at all allowed to interfere. The breakfast table was daily spread for thirty persons, that all who came on business at that hour should partake of it, and that the various matters which occasioned their visits might be discussed during its progress without encroaching on the day. By this rigid economy of time Sir Thomas was enabled to get through an amount of business which would appear wholly incredible to one who placed less value on it than he did. He wrote almost every paper of any importance connected with his government with his own hand. He read all communications and documents, and examined all plans and statements, with his own eyes, and heard every complaint and representation which was made verbally with his own ears.

Although Sir Thomas had not thought it advisable to decline the governorship of Madras, he yet came out with every intention of returning again to his native land as soon as circumstances would permit, and in 1823 he addressed a memorial to the court of directors, earnestly requesting to be relieved from his charge. From a difficulty, however, in finding a successor to Sir Thomas, and from the extraordinary efficiency of his services, the court was extremely unwilling to entertain his request, and allowed many months to elapse without making any reply to it. In the meantime the Burmese war took place, and Sir Thomas found that he could not, with honour or propriety, press his suit on the directors. He therefore came to the resolution of remaining at his post to abide the issue of the struggle. In this war he distinguished himself, as he had so often done before, by singular bravery, talent, and intelligence, and performed such important services as procured him the elevation, June, 1825, to the dignity of a baronet of Great Britain.

At the conclusion of the Burmese war Sir Thomas again applied for liberty to resign his appointment, and after much delay the Right Honourable S. Lushington was nominated his successor, on the 4th April, 1827. Sir Thomas now prepared to leave India for the last time, full of fond anticipations of the happiness which awaited the closing years of his life in his native land; but it was otherwise ordained. His lady, with a favourite son, had returned to England a year before, in consequence of an illness of the latter, which, it was thought, required this change of climate; and thus, while the inducements to remain in India were greatly lessened, those to return to his native land were increased. While awaiting the arrival of his successor, Sir Thomas unfortunately came to the resolution of paying a farewell visit to his old friends in the Ceded Districts, where the cholera was at that time raging with great violence. Alarmed for his safety, his friends endeavoured to dissuade him from his intended excursion, but to no purpose. Towards the end of May he set out from Madras, attended by a small escort, and on the 6th July following reached Puteeccondah, where he was seized with the fatal distemper about nine o'clock in the morning, and expired on the

evening of the same day at half-past nine, in the sixty-sixth year of his age. In an hour and a half after his death his body was removed to Gooty, where it was interred with such military honours as the remoteness of the situation, and the despatch which it is necessary to observe on such occasions in India, could afford.

Few events ever occurred in India which excited so general a sensation, or created so universal a feeling of regret, as the death of Sir Thomas Munro. Natives as well as Europeans mourned his loss with unfeigned sorrow. His justice, humanity, benevolence, and eminent talents, had secured him the esteem and respect of all who knew him, and he was known nearly throughout the whole extent of the eastern world. No man perhaps, in short, ever descended to the grave more beloved or more lamented, and none was ever more entitled to these tributes of affection from his fellow-men, or ever took such pains to deserve them, as Sir Thomas Munro. With regard to his talents, had there been no other proof of their existence than that which his letters afford, these alone would have pointed him out as a remarkable man; and as one who, had he chosen it, might have become as eminent in literature as he was in the profession of arms. Three volumes of these compositions and a memoir of the writer, have been published under the superintendence of the Rev. Mr. Gleig, author of the *Subaltern*.

MURE, SIR WILLIAM, of Rowallan, a poet, was born about the year 1594. He was the eldest son of Sir William Mure of Rowallan, by a sister of Montgomery, the author of the *Cherry and the Slae*. The family was one of the most ancient of the order of gentry in that part of the country, and through Elizabeth Mure, the first wife of Robert II., had mingled its blood with the royal line: it recently terminated in the mother of the Countess of Loudon and Marchioness of Hastings. Of the poet's education no memorial has been preserved, but it was undoubtedly the best that his country could afford in that age, as, with a scholar-like enthusiasm, he had attempted a version of the story of Dido and Æneas before his twentieth year. There is also a specimen of Sir William's verses in pure English, dated so early as 1611, when he could not be more than seventeen. In 1615, while still under age, and before he had succeeded to his paternal estate, he married Anna, daughter of Dundas of Newliston, by whom he had five sons and six daughters. The eldest son, William, succeeded his father; Alexander was killed in the Irish rebellion, 1641; Robert, a major in the army, married the Lady Newhall, in Fife; John was designed of Fenwickhill; and Patrick, probably the youngest, was created a baronet of Nova Scotia in 1662. One of the daughters, Elizabeth, was married to Uchter Knox of Ranfurly. Sir William Mure married, secondly, Dame Jane Hamilton, Lady Dunreath; and of this marriage there were two sons and two daughters; James, Hugh, Jane, and Marion.

The earliest of Sir William's compositions to be found in print is an address to the king at Hamilton, on his progress through the country in 1617, which is embodied in the collection entitled the *Muse's Welcome*. Such productions of his earlier years as have been preserved are chiefly amatory poems in English, very much in the manner of the contemporary poets of the neighbouring kingdom, and rivaling them in force and delicacy of sentiment. Sir William seems to have afterwards addicted himself to serious poetry. In 1628 he published a translation, in English sapphics, of Boyd of Trochrig's

beautiful Latin poem, *Alcatombe Christiana*; and in the succeeding year produced his *Tree Crucifixe for Tree Catholicikes*, Edinburgh, 12mo; intended as an exposure of the prime object of Romish idolatry. By far the larger portion of his writings remain in manuscript.

Like his contemporary, Drummond of Hawthornden, Mure seems to have delighted in a quiet country life. A taste for building and rural embellishment is discoverable in the family of Rowallan at a period when decorations of this nature were but little regarded in Scotland: and in these refinements Sir William fell nothing behind, if he did not greatly surpass, the slowly advancing spirit of his time. Besides planting and other ameliorations, he made various additions to the family mansion, and "reformed the whole house exceedingly."

At the commencement of the religious troubles, Sir William Mure, though in several of his poems he appears as paying his court to royalty, took an interest in the popular cause; and in the first army raised against the king, commanded a company in the Ayrshire regiment. He was a member of the parliament, or rather convention, of 1643, by which the Solemn League and Covenant was ratified with England; and in the beginning of the ensuing year accompanied the troops which, in terms of that famous treaty, were despatched to the aid of the parliamentary cause. After a variety of services during the spring of 1644, he was present and wounded in the decisive battle of Long Marston-moor, July 2d. In the succeeding month he was engaged at the storming of Newcastle, where for some time, in consequence of the superior officer's being disabled, he had the command of the regiment. Whether this was the last campaign of the poet, or whether he remained with the army till its return after the rendition of the king in 1647, is not known. No further material notice of him occurs, except that, on the revision of Roos's *Psalms* by the General Assembly in 1650, a version by Mure of Rowallan is spoken of as employed by the committee for the improvement of the other. Sir William died in 1657. Various specimens of his compositions may be found in a small volume, entitled "*Ancient Ballads and Songs*, chiefly from Tradition, Manuscripts, and Scarce Works, with Biographical and Illustrative Notices, including Original Poetry, by Thomas Lyle: London," 1827; to which we have been indebted for the materials of this article.

MURRAY, ALEXANDER, D.D., an eminent philologist, was born, October 22, 1775, at Dunkitterick, on the water of Palneur, in the stewartry of Kirkcudbright. He was the son of a shepherd, or pastoral farm-servant, named Robert Murray, who was in the seventieth year of his age at the time of the birth of this distinguished member of his family. Young Murray was born in too humble circumstances, and reared in too secluded a district, to have the advantage of early instruction at school. When he had attained his sixth year his father purchased for him a copy of the Shorter Catechism; a work prefaced, in Scottish editions, by the alphabet in its various forms, and a few exercises in monosyllables. The good shepherd, however, thought this little volume (the cost of which is only one penny) too valuable for common use: it was accordingly locked carefully aside, and the father taught his child the letters by scribbling them on the back of an old wool-card with the end of a burned heather-stem. When the elements of language had been thus mastered, the Catechism was brought forth, and given to the young student as a book of exercises in read-

ing. He then got a psalm-book, which he liked much better than the Catechism; and at length a New Testament, which he liked better still; and afterwards he discovered an old loose Bible, which he carried away piecemeal from the place where it was deposited, and read with all the wonderment natural to a capacious mind on being first introduced to a kind of knowledge beyond the limited scene in which it had originally been placed. He liked the mournful narratives best, and greatly admired Jeremiah, Ezekiel, and the Lamentations. In his eighth year he had acquired so much local fame, on account of his acquirements in reading, that a wish was generally entertained among his friends to see him sent to some regular school. This would have been impossible—for his father was a very poor man—if a brother of his mother, by name William Cochrane, had not possessed both the means and the inclination to provide the requisite funds. He was placed, in 1784, at the school of New Galloway, where, though he made a very awkward appearance at first, he soon distanced the most of “the Bible class.” He had been but six months at school when he was seized by an illness which called him home; nor did he again attend school for the four ensuing years. During the most of this space of time he appears to have been employed as a shepherd; devoting all his leisure, however, to the study of such books as fell in his way. In the winter of 1787-8 he was so far advanced as to be able to teach the children of two neighbouring farmers. Soon after he began to give irregular attendance at the school of Minnigaff, chiefly for the purpose of improving his arithmetic, as he had now formed a wish to become a merchant’s clerk. In 1790 he made his first adventure into the region of languages, by studying French and Latin; and such was his application, that in the course of three or four months he had learned as much as the most of youths acquire in as many years. By extraordinary good fortune he obtained an old copy of the larger dictionary of Ainsworth, at the low price of eighteenpence, and soon read the volume quite through. Every part of this large book he studied with minute attention, observing the Greek derivations of the words, and occasionally adverting to the Hebrew also; and thus, about a year after his first acquaintance with the rudiments, he was able to read Ovid, Cæsar, and Livy, and to commence lessons in the *Iliad*. All the books which his school-fellows possessed, both in English and classical literature, were borrowed by Murray, and devoured with immense rapidity and eagerness. He had at this time no taste in reading: the boundless field of knowledge was open to him, and he cared not which part he first surveyed, for he was determined apparently to survey it all. He only felt a kind of wild pleasure in whatever was grand, or romantic, or mournful. In perusing the *Iliad*, he was greatly affected by the fate of Hector and Sarpedon; “and no sensation,” says he in his autobiography, “was ever more lively than what I felt on first reading the passage which declares that Jupiter rained drops of blood upon the ground, in honour of his son Sarpedon, who was to fall far from his country. My practice,” he continues, “was to lay down a new and difficult task; after it had wearied me—to take up another—then a third—and to resume this rotation frequently and laboriously.” Dr. Murray used to consider himself fortunate in his teacher, Simpson, in as far as the man was of a careless, easy character, and had no scruple in permitting him to advance as fast as he liked, and to step into any class for which he appeared qualified. “Desultory study,” says he, “is a bad thing; but a lad whose ambition never

ceases, but stimulates him incessantly, enlarges his mind and range of thought by excursions beyond the limits of regular forms.” We shall let Dr. Murray narrate his further progress in his own words:—

“In 1792 I read portions of Homer, Livy, Sallust, and any other author used in the school. In the winter, 1792-3, I engaged myself with Thomas Birkmyre, miller, of Minnigaff Mill, and taught his children during that season till March, 1793. My wages were only thirty shillings, but my object was to get a residence near Newton-Stewart, and to have liberty of going, in the winter forenights, to a school taught by Mr. Nathaniel Martin, in Brigend of Cree. Martin had been at Edinburgh, and possessed many new books, such as the *Bee*, Duncan’s *Cicero*, some of the best English collections, and so forth. From a companion named John Mackilwraith I got the loan of Bailie’s *English Dictionary*, which I studied, and learned from it a vast variety of useful matters. I gained from it the Anglo-Saxon alphabet, the Anglo-Saxon paternoster, and many words in that venerable dialect. This enabled me to read Hicke’s *Saxon Grammar* without difficulty after I went to Edinburgh, and led the way to the Visi-Gothic and German. About the end of autumn, 1792, I had procured from one Jack Roberts a small Welsh *History of Christ and the Apostles*. I had seen a translation, or rather the original English, of this book in former years, but I could not get access to it after I had the Welsh in my possession. I mused, however, a good deal on the quotations from Scripture that abound in it, and got acquainted with many Welsh words and sentences. If I had a copy of the Bible in any language of which I knew the alphabet, I could make considerable progress in learning it without grammar or dictionary. This is done by minute observation and comparison of words, terminations, and phrases. It is the method dictated by necessity, in the absence of all assistance.

“In 1791 I had the loan of a stray volume of the *Ancient Universal History* from my neighbour school-fellows the Maclurgs, who lived in Glenhoash, below Risque. It contained the history of the ancient Gauls, Germans, Abyssinians, and others. It included a very incorrect copy of the Abyssinian alphabet, which, however, I transcribed, and kept by me for future occasions. I was completely master of the Arabic alphabet, by help of Robertson’s *Hebrew Grammar*, in the end of which (first edition) it is given in the most accurate manner.

“In the autumn of 1792, about the time I went to the mill, I had, in the hour of ignorance and ambition, believed myself capable of writing an epic poem. For two years before, or rather from the time that I had met with *Paradise Lost*, sublime poetry was my favourite reading. Homer had encouraged this taste, and my school-fellow George Mure had lent me, in 1791, an edition of Ossian’s *Fingal*, which is, in many passages, a sublime and pathetic performance. I copied *Fingal*, as the book was lent only for four days, and carried the MS. about with me. I chose Arthur, general of the Britons, for my hero, and during the winter, 1792-3, wrote several thousands of blank verses about his achievements. This was my first attempt in blank verse. In 1790 I had purchased *The Grave*, a poem by Blair, and committed it almost entirely to memory.

“I passed the summer of 1793 at home, and in long visits to my friends in Newton-Stewart and other parts. During that time I destroyed *Arthur and his Britons*, and began to translate, from Buchanan’s poetical works, his *Fratres Franciscani*.

I made an attempt to obtain Mochrum school; but Mr. Steven, minister of that parish, who received me very kindly, told me that it was promised, and that my youth would be objected to by the heritors and parish.

"Some time in the same summer I formed an acquaintance with William Hume, a young lad who intended to become an Antiburgher clergyman, and who kept a private school in Newton-Stewart. This friendship procured me the loan of several new books. I paid a visit to the Rev. Mr. Donnan, in Wigton, an excellent man and scholar. He examined me on *Homer*, which I read *ad aperturam libri*, in a very tolerable, though not very correct manner. He gave me *Cicero de Naturâ Deorum*, which I studied with great ardour, though a speculative treatise. I was enthusiastically fond of Cicero, as my dictionary gave me a most affecting account of the merits and fate of that great man. In 1791 I bought for a trifle a MS. volume of the lectures of Arnold Drackenburgh, a German professor, on the lives and writings of the Roman authors from Livius Andronicus to Quintilian. This was a learned work, and I resolved to *translate* and publish it. I remained at home during the winter of 1793-4, and employed myself in that task. My translation was neither elegant nor correct. My taste was improving; but a knowledge of elegant phraseology and correct diction cannot be acquired without some acquaintance with the world, and with the human character in its polished state. The most obscure and uninteresting parts of the *Spectator*, *World*, *Guardian*, and *Pope's Works*, were those that described life and manners. The parts of those works which I then read with rapture were accounts of tragic occurrences, of great but unfortunate men, and poetry that addressed the passions. In spring, 1794, I got a reading of Blair's *Lectures*. The book was lent by Mr. Strang, a Relief clergyman, to William Hume, and sublent to me. In 1793 I had seen a volume of an encyclopædia, but found very considerable difficulties in making out the sense of obscure scientific terms, with which those books abound.

"Early in 1794 I resolved to go to Dumfries and present my translation to the booksellers there. As I had doubts respecting the success of a *History of the Latin Writers*, I likewise composed a number of poems, chiefly in the Scottish dialect, and most of them very indifferent. I went to Dumfries in June, 1794, and found that neither of the two booksellers there would undertake to publish my translation; but I got a number of subscription-papers printed, in order to promote the publication of the poems. I collected by myself and friends four or five hundred subscriptions. At Gatehouse, a merchant there, an old friend, gave me a very curious and large-printed copy of the Pentateuch, which had belonged to the celebrated Andrew Melville, and the *Hebrew Dictionary* of Pagninus, a huge folio. During the visit to Dumfries I was introduced to Robert Burns, who treated me with great kindness; told me, that if I could get out to college without publishing my poems, it would be better, as my taste was young and not formed; and I would be ashamed of my productions when I could write and judge better. I understood this, and resolved to make *publication* my last resource. In Dumfries I bought six or seven plays of Shakspeare, and never read anything, except Milton, with more rapture and enthusiasm."

The singular acquirements of this Galloway shepherd had now made some impression in a circle beyond his own limited and remote sphere; and in November, 1794, he was invited to Edinburgh, in order to make an exhibition of his learning before

several individuals, who were not only qualified to judge of it, but were inclined to take an interest in the fate of its possessor. He underwent an examination before Drs. Baird, Finlayson, and Moodie, clergymen of the city; and so effectually convinced these gentlemen of his qualifications, that they took the means to procure for him a gratuitous education in the university. Dr. Baird proved, in particular, a zealous and steady friend, not only in the exertion of his influence, but by contributions to the means of his subsistence during the earlier part of his academic career. At the end of two years he obtained a bursary, or *exhibition*, from the city, and soon after was able to support himself by private teaching. He now commenced the necessary studies for the church, at the same time that he devoted every hour he could spare to the acquisition of general knowledge. In a very short space of time he found himself master of the whole of the European languages, and began to make researches in the more recondite dialects of the East. His philological studies were conducted with a careful regard to etymology and the philosophy of grammar; and it would appear that the design of tracing up all existing languages to one root, and thus penetrating back into the early and unchronicled history of the human race, gradually expanded upon him.

While thus devoting his leisure to one grand pursuit, he did not neglect the graces of the belles-lettres. After having for some years contributed miscellaneous pieces to the *Scots Magazine*, he was induced, about the beginning of the present century, to become the editor of that respectable work, then the property of Mr. Archibald Constable. He also contributed several able articles to the *Edinburgh Review*. Having made himself master of the Abyssinian language, and also of the Geez and Amharic tongues, upon which the former is founded, he appeared to Mr. Constable as a fit person to superintend a new edition of Bruce's *Travels* to discover the source of the Nile. For nearly three years subsequent to September 1802 he was engaged with little intermission upon this task, chiefly residing at Kin-naird House, where he had access to the papers left by the illustrious traveller. To the work, which appeared in seven large octavo volumes, he contributed a life of the author, and a mass of notes, containing the most curious and learned discussions on philology, antiquities, and a manifold variety of subjects illustrative of Bruce's narrative. The *Life* he afterwards enlarged and published in a separate volume.

In 1806 Dr. Murray for the first time obtained what might be considered a permanent station by being appointed assistant and successor to the Rev. Mr. Muirhead, minister of Urr, in the stewartry of Kirkcudbright; at whose death, in 1808, he became the full stipendiary of the parish. In this situation he displayed, amidst his clerical duties, his usual application to philological pursuits. His fame as a linguist was now spread abroad by his edition of Bruce, and in 1811, at the suggestion of Mr. Salt, envoy to Abyssinia, he was applied to, to use Mr. Salt's own words, as "the only person in the British dominions" adequate to the task, to translate a letter written in Geez, from the governor of Tigre to his Britannic majesty. Notwithstanding the obscurity of several passages in this rare document, he was able to acquit himself of his task in the most satisfactory manner.

In 1812, on a vacancy occurring in the chair of oriental languages in the university of Edinburgh, Dr. Murray stood a contest with two other candidates, and gained the situation by a majority of two

voices in the city council. He was now for the first time in life placed in a situation suitable to his extraordinary faculties; and yet it was destined that, after all his preliminary labours, his career was now on the point of being forever closed. His constitution, which had never been strong, broke down under the labours of the first session. Before opening his class he had published his *Outlines of Oriental Philology*, a remarkably clear and intelligible epitome of the grammatical principles of the Hebrew and its cognate dialects. During the winter the fatigue he encountered in preparing his lectures was very great; and in February, 1813, a pulmonary ailment, which had previously given him great distress, became so violent as to prevent his attendance in the class-room. To quote the affecting account of his latter days given by Mr. Murray,¹ "he himself entertained hopes of his recovery, and was flattering himself with the prospect of being able to remove to the country; but his complaints daily assumed a more alarming aspect. On the day before his death, he was out of bed for twelve hours. He arranged several of his papers, spoke freely, and appeared in good spirits. He alluded to his approaching dissolution, which he now himself began to apprehend; but Mrs. Murray was too agitated to admit of the subject being minutely adverted to. He retired to bed at eleven o'clock; he dozed a little; and every moment he was awake he spent in prayer. In the true spirit of genius he said that he had once expected to attain to old age, and that he would be enabled to perform something of a more eminent nature, and of greater consequence to society, than he had yet accomplished; but not a murmur escaped his lips; he was, at all times, perfectly resigned to the will of the Eternal. The following verse of Psalm cxviii. he repeated a few hours before his death.

"O set ye open unto me
The gates of righteousness;
Then I will enter into them,
And I the Lord will bless."

At the end of these lines he made a pause, and Mrs. Murray having proceeded with the subsequent verse,—

"This is the gate of God; by it
The just shall enter in;
There will I praise, for thou me heard'st,
And hast my safety been,"—

He looked wistfully and tenderly in her countenance—he put his hand on his breast—and said it gave him relief and consolation. He now became suddenly worse; his speech failed him; and having lingered in this state for a short time, he breathed his last in the arms of his wife. This melancholy event took place at six o'clock in the morning of the 15th of April, 1813, in the thirty-seventh year of his age. The last words he was heard to utter were, 'Take care burial-ground;' meaning, no doubt, to intimate his desire that his remains might be placed in a grave which had not been previously occupied. He was interred in the Grayfriars' Church-yard, at the north-west corner of the church."

So died this amiable and most accomplished scholar after a life which might rather be described as the preparation for something great than as having actually produced any great fruits. He had written a philological work of profound and varied learning, which appeared in 1813, under the auspices of Dr. Scot of Corstorphine, entitled "*History of European Languages*; or, *Researches into the Affinities of the Teutonic, Greek, Celtic, Slavonic, and Indian Nations.*" He left, by his wife, whom he married

while engaged in his pastoral duties at Urr, a son and a daughter, the latter of whom died of consumption in 1821.

MURRAY, EARL OF. See STUART (JAMES).

MURRAY, SIR GEORGE. This gallant soldier and able statesman was the second son of Sir William Murray, Bart., and Lady Augusta Mackenzie, seventh and youngest daughter of George Earl of Cromarty. He was born at the family seat in Perthshire, on the 6th of February, 1772, and received his education, first at the high-school, and afterwards at the university of Edinburgh. Having chosen the military profession, he obtained an ensigncy in the 71st regiment of foot at the age of seventeen, from which he rapidly transferred himself, first to the 34th, and afterwards to the 3d regiment of Guards. He first saw service in the campaigns of Flanders in 1794 and 1795, and shared in the disastrous retreat of the allied army through Holland and Germany, and subsequently, during the last of these years, he served in the West Indies under Sir Ralph Abercromby, until ill health obliged him to return home, where he served upon the staff, both in England and Ireland, during 1797 and 1798. Such is but a scanty outline of his military services during this stirring period, when war was the principal occupation, and when it was successively shifted to every quarter of the globe. During these changes the promotion of Sir George went onward steadily, so that he rose through the various ranks, from an ensign to a lieutenant-colonelcy in the Guards, to which he was appointed in 1799.

It is well known that at this period the military profession had few of those attractions which it subsequently possessed, when Wellington, and the heroes whom he trained to victory, directed the operations of our armies; in too many cases our commanders groped their way in the dark, while the soldiers had little more than their characteristic bull-dog obstinacy and courage to rely upon when they found themselves out-marched and out-manceuvred. This Colonel Murray was doomed to experience in his next campaign, which was the expedition to Holland, an expedition attended with an immense amount of loss, suffering, and disaster, and with very little honour as a counterpoise. Of course Murray came in for his full share of hardship and privation during the retreat, and was wounded at the Helder, but was able to proceed with his regiment to Cork. A better promise of distinction dawned for him when he was sent with his regiment from Cork to Gibraltar, to serve under the brave Sir Ralph Abercromby in the Egyptian campaign; and in this successful expedition he performed an important part, having been placed in the quarter-master general's department, and sent forward to Egypt for the purpose of making arrangements previous to the arrival of the British army. Here Murray's active enterprising spirit found full occupation; he was present at every engagement, where he rendered most effectual service, and had his merit acknowledged by the Turkish government, which conferred upon him the order of the Crescent.

After the termination of this prosperous expedition, Colonel Murray's services were transferred from Egypt to the West Indies, for which he embarked in 1802, with the rank of adjutant-general to the British forces in these colonies. His stay there, however, was brief; and on returning home, and occupying for a short period a situation at the horse-guards, he was next employed in Ireland, with the appointment of deputy quarter-master general. From this comparatively peaceful occupation, after holding it for two years, he was called out, in 1806, to the

¹ *Literary History of Galloway*, second edition, p. 256.

more congenial prospect of active service, in consequence of the projected expedition to Stralsund, which, like many others of the same kind, was rendered abortive through the unprecedented successes of the French, upon which few as yet could calculate, owing to the new mode of warfare introduced by Napoleon, and the startling rapidity of his movements. Colonel Murray's next service was of a diplomatic character, and to the court of Sweden; but its freakish sovereign, whose proceedings were perplexing alike to friend and enemy, was not to be reasoned into moderation; and therefore neither Murray, nor yet Sir John Moore, who was sent out with a military force, could avert those disasters which terminated in that monarch's deposition. From Sweden Colonel Murray, now holding the rank of quarter-master general, went with the British troops in that country to Portugal, where they joined Sir Arthur Wellesley, who had now commenced that splendid career which scarcely encountered an interruption, and led to such important results in the history of Europe, of which ages must tell the termination.

It would be too much to detail the career of Colonel Murray while he served in Spain and Portugal under the command of Wellington. At almost every engagement he was present, while his conduct was such as to elevate him into that chosen band whom history will recognize as the "heroes of the Peninsular war." The sense of the value of his services was also shown in his appointment to the rank of major-general in 1812, to the command of a regiment in 1813, and to the honorary title of Knight of the Bath in the same year. With the exile of Napoleon to Elba, when it was thought that every chance of further war had ended, Sir George Murray was not to retire, like so many of his companions in arms, into peaceful obscurity; on the contrary, his talents for civil occupation having been fully experienced, he was appointed to the difficult charge of the government of the Canadas. He had scarcely fully entered, however, upon the duties of this new appointment, when he was advertised by the secretary of state of Bonaparte's escape from Elba and landing in France, accompanied with the choice of remaining in his government of the Canadas, or returning to Europe and resuming his military occupations. Sir George at once decided upon the latter; but though he made the utmost haste to rejoin the army, such delays occurred that he did not reach it until the battle of Waterloo had been fought, and Paris occupied by the allies. In the French capital he remained three years with the army of occupation, holding the rank of lieutenant-general, and honoured with seven different orders of foreign knighthood, independently of those he had received from his own court, in attestation of his services and worth. At his return home, also, when Paris was resigned by the allies to its own government, he was appointed governor of the castle of Edinburgh, afterwards of the royal military college, and finally lieutenant-general of the ordnance. Literary distinctions, moreover, were not wanting; for in 1820 he received from the university of Oxford the degree of Doctor of Common Laws, and in 1824 he was chosen a fellow of the Royal Society.

Such is a very scanty outline of the history of Sir George Murray; and it gives but a faint idea of his long military career. "Very few men," says one of his biographers, "even among our distinguished veterans, have seen such severe and active service as Sir G. Murray. Sharp fighting and military hardships seemed to be his lot, from the first moment at which he carried the colours of his regiment, till the

last cannon resounded on the field of Waterloo. With the single exception of India, he was absent neither from the disasters nor the triumphs of the British army. France, Ireland, Sweden, Portugal, Spain, the West Indies, Denmark, and Egypt, have witnessed the services of this able and experienced commander. . . . It has often been remarked of the Duke of Wellington, as of all great men, that he is singularly prompt in discerning the particular individual who happens to be the man above all others best fitted for the particular duties which he requires to have discharged. His great general of division was Lord Hill, and his great cavalry officer Lord Anglesey; his great organizer of raw levies, Lord Beresford; and his best of all quarter-masters, General Sir G. Murray."

Sir George was now to astonish the world by equal excellence in a very different department. He had left the university of Edinburgh for the army at the early age of seventeen, and from that period to the close of his military career his life had been one of incessant action and change, so that it was evident he could have had very little time for study and self-improvement. And yet he was distinguished throughout as an accomplished scholar, eloquent orator, and able writer, and was now to bring all these qualities to bear upon his new vocation as a statesman. Men who wondered how or at what time he could have acquired those excellencies, which are generally the result of a life of peaceful avocation and study, were obliged to settle upon the conclusion that his mind must have been of such a singularly precocious character as to be able to finish its education at the early age of seventeen! He commenced his career as a politician in 1823, when he was chosen member of parliament for the county of Perth, and in 1826 he changed his condition in life by becoming a husband and a father, at the age of fifty-four, his wife being Lady Louisa Erskine, sister of the Marquis of Anglesey, and widow of Sir James Erskine, by whom he had one daughter. In 1828 he resigned the command of the army in Ireland for the office of secretary of state for the colonies—and it was in this department especially that he astounded his contemporaries by his political sagacity, aptitude for business, and talents as an orator and debater. "He possessed," we are told, "the power of logical arrangement in a remarkable degree; and though his speeches did not 'smell of the lamp,' they always had a beginning, middle, and conclusion; besides that, they possessed a coherence and congruity rarely found in parliamentary speeches, a force and appropriateness of diction not often surpassed, an eloquence and copiousness which a soldier could not be expected to attain, and an agreeable style of delivery which many more professed speakers might imitate with advantage."

After these explanations it becomes the less necessary to enter into a full detail of Sir George Murray's political proceedings. His office of secretary for the colonies was discharged with ability and success; and his ascendancy in the house upon general questions was universally felt and acknowledged. He supported the Roman Catholic Relief Bill, and opposed the Liberal government in 1830 and 1831. In 1832, upon the passing of the Reform Bill and dissolution of parliament that followed, Sir George was again candidate for Perthshire, to which he had been repeatedly elected as representative; but on this occasion the tide was against him and in favour of Lord Ormelie; but when the latter succeeded to the peerage in 1834 as Marquis of Breadalbane, Perthshire again presented a parliamentary vacancy, to which Sir George was called,

in preference to Mr. Graham, the Whig candidate. This seat he again lost under Sir Robert Peel's administration in 1834-5, Mr. Fox Maule, now Lord Dalhousie, being the successful candidate; but Sir George held the important appointment of master-general of the ordnance to console him under his defeat. Such were the political fluctuations of this stirring period, in which the chief war that was waged by the country was one of hot and hard words, with the floor of the House of Commons for its battle-field. In 1837, when there was a general election in consequence of the accession of Queen Victoria, Sir George Murray stood for Westminster; but his political opinions were so different from those of the many in this stronghold of Liberalism, that he was unsuccessful. Scarcely two years afterwards he was tempted to stand for Manchester, which had become vacant by the promotion of its representative, Mr. Paulett Thompson, to the peerage; but here again Sir George was unsuccessful. Still, however, he remained a minister of the crown, as master-general of the ordnance, to which he was reappointed in 1841. His last public effort was in a literary capacity, when he edited five volumes of the Duke of Marlborough's despatches, by which an important addition was made to the historical annals of Britain.

After so long a course of active exertion, Sir George's strong constitution gave way, so that for more than a year previous to his death he was unable to leave his house in Belgrave Square: there, however, he continued to attend to the duties of his office until the last six months, when, unable for further exertion, he tendered his resignation. His death occurred on the 26th of July, 1846, at the age of seventy-four.

MURRAY, PATRICK, fifth Lord Elibank, a nobleman distinguished by erudition and literary taste, was the eldest son of Alexander, the preceding lord, by Elizabeth, daughter of George Stirling, surgeon in Edinburgh. He was born in February, 1703. For reasons with which we are unacquainted he studied for the Scottish bar, at which he entered in 1723, but in the same year adopted the military profession, and soon rose to a considerable rank in the army. He was in 1740 a lieutenant-colonel under Lord Cathcart in the expedition to Carthage, of which he wrote an account that remains in manuscript in the library of the Board of Trade. He had now succeeded to the family title, and was distinguished for his wit and general ability. His miscellaneous reading was extensive, and we have the authority of Dr. Johnson that it was improved by his own observations of the world. He lived for many years at a curious old house belonging to the family of North, at Catage in Cambridgeshire; and it has been recently ascertained that he kept up a correspondence with the exiled house of Stuart. In the latter part of his life he appears to have chiefly resided in Edinburgh, mingling with the distinguished literati of the city who were his contemporaries, and fully qualified by his talents and knowledge to adorn even that society.

In 1758 he published at Edinburgh, *Thoughts on Money, Circulation, and Paper Currency*; and an *Inquiry into the Origin and Consequence of the Public Debts* appeared afterwards. In 1765 he issued *Queries relating to the Proposed Plan for Altering Entails in Scotland*, and in 1773 a *Letter to Lord Hailes on his Remarks on the History of Scotland*. His lordship's political life was entirely that of an opposition lord, and among other subjects which attracted his indignant attention, was the servile condition of his native peerage. In the year 1774

he published a work under the title of *Considerations on the Present State of the Peerage of Scotland*, which attracted a considerable degree of attention. "Never," says he, "was there so humbling a degradation as what the Scots peers of the first rank and pretensions suffer by the present mode of their admittance to the House of Lords. For the truth of this one needs but to appeal to their own feelings, or to the common estimation of mankind. A Scots peer of the first rank is considered as an instrument singled out and posted in the House of Lords by the appointment of the minister at the time, for the end of supporting his measures, whatever they are or may be; and who, in case of failure, must expect to be turned out at the expiration of his term of seven years. He is supposed to be composed of such pliant materials, that in the event of a change of administration, the next minister makes no doubt of finding him equally obsequious, and ready to renounce his former connections." When Dr. Johnson visited Scotland in 1773, Lord Elibank addressed to him a courteous letter, which is to be found in Boswell's *Tour to the Hebrides*, where are also the records of various conversations in which both men displayed their powers. The English philosopher declared that he never met his lordship without going away a "wiser man." Lord Elibank in early life married the Dowager-lady North and Grey, who was by birth a Dutch woman, and of illustrious extraction. He died without issue, August 3, 1778, in the seventy-sixth year of his age.

Two younger brothers of this nobleman attracted considerable notice in their lifetime. The elder, Mr. Alexander Murray, was so enthusiastic a Jacobite, as to propose leading an insurrection even after the close of all the just hopes of the house of Stuart in 1746. He was confined for more than a year subsequent to May, 1750, by order of the House of Commons, for violent interference with a Westminster election; and as he refused to express contrition on his knees, according to the order of the house, he might have been confined for a much longer period, if the prorogation of parliament had not brought about his enlargement. James Murray, the fourth and youngest brother of Lord Elibank, distinguished himself as an officer in high command during the Canadian war. Being in the next war constituted governor of Minorca, he defended that important station in 1781 against a greatly disproportioned force of the French; and, what was more to his credit, withstood the secret offer of a million for its surrender. After a protracted siege, during which General Murray lost three-fourths of his men, he was obliged by the scurvy to give up Fort St. Philip, to which he had retired, but rather in the condition of an hospital than a fortress. His conduct was warmly applauded by the British government and nation.

MURRAY, SIR ROBERT, a statesman and natural philosopher, appears to have been born about the commencement of the seventeenth century. He was a son of Sir Robert Murray of Craigie, by a daughter of George Halket of Pitferrian. According to his intimate friend Burnet, he served in the French army, and having found great favour with the all-potent Richelieu, was early promoted to a colonelcy.¹ When the difficulties of Charles I. assumed their most alarming aspect he returned to Scotland, and raised recruits for the royal army. When the king was with the Scots army at Newcastle, he seems to have attempted an escape designed by Sir Robert. "The design," says Burnet, "was thus laid: Mr.

¹ Burnet's *Own Times*, i. 59.

Murray had provided a vessel by Teignmouth, and Sir Robert Murray was to have conveyed the king thither in disguise; and it proceeded so far, that the king put himself in the disguise, and went down the back stairs with Sir Robert Murray. But his majesty, apprehending it was scarce possible to pass through all the guards without being discovered, and judging it hugely indecent to be caught in such a condition, changed his resolution and went back, as Sir Robert informed the writer.¹ About this period, it is probable that he had not received his title, and that he may be identified with "Mr. Robert Murray, quarter-master general," who, on the occasion of the town of Berwick (which was ordered to be dismantled at the treaty of the two kingdoms) petitioning to be permitted to keep three pieces of ordnance, and the two gates of the bridge, was "sent to Berwick with his majesty's recommendation, to take notice what may be the importance of that petition, and report the same to the house."² After the fall of the royal cause he appears to have been recommended by the parliament of Scotland to the French government, and to have obtained from Mazarine a continuation of the favours extended to him by Richelieu. On the 22d May, 1650, two letters from France were read to the parliament of Scotland, one from the young king, the other from the queen-regent, in answer to the letter of the parliament in favour of Sir Robert Murray; in which "both did promise, from their respect and love to the Scots nation, they would see their desire performed, so far as possibly the convenience of their affairs would permit, and that he should be paid off his arrears."³ We afterwards find the parliament exhibiting their favour by sending him a few cargoes of prisoners to serve in his ranks. Of 281 soldiers taken at Kerbester, where the Marquis of Montrose was finally defeated, after some disposals to coal-mines, &c., the remainder "are given to Lord Angus and Sir Robert Murray to recruit their French troops with."⁴ It is probable that he was an officer in the Scots guards. He continued in the confidence of Charles II., and was connected with the obscure negotiations of Montreville with the Independents and Presbyterians, for the purpose of procuring their assistance at as cheap a rate as possible to the conscience of the king, or under the form of promise which might admit the easiest and safest infraction on his part. The moderation of Sir Robert in matters connected with the church, evinced in this transaction, may have been the reason why Clarendon termed him "a cunning and a dexterous man;" and accused him of attempting, under the pretext of bringing the king to peace with the Scots, a coalition betwixt the Roman Catholics and Presbyterians, to the destruction of the Church of England.

On the 21st May, 1651, while Charles was in command of the army in Scotland, Sir Robert was appointed justice-clerk; and on the 6th of June he was chosen a lord of session, and nominated a privy-councillor.⁵ But the subversion of the courts by Cromwell prevented him from sitting in judgment. Burnet mentions that he was in great credit with the remains of the king's army surviving in Scotland, when "Lord Glencairn took a strange course to break it, and to ruin him." A letter written by him to William Murray, a low minion who had risen in the court of Charles I. by the performance of the most despicable offices, was pretended to have been found at Antwerp. "This ill-forged letter gave an account of a bargain Sir Robert had made with

Monk for killing the king, which was to be executed by Mr. Murray: so he prayed him in his letter to make haste and despatch it. This was brought to the Earl of Glencairn: so Sir Robert was severely questioned upon it, and put in arrest: and it was spread about through a rude army that he intended to kill the king, hoping, it seems, that some of these wild people, believing it, would have fallen upon him without using any forms. Upon this occasion Sir Robert practised, in a very eminent manner, his true Christian philosophy, without showing so much as a cloud in his whole behaviour."⁶

At the discussion at Whitehall, on the question of the future established religion in Scotland, Sir Robert Murray, along with Hamilton and Lauderdale, proposed to delay the establishment of Episcopacy until the temper of the people should be ascertained.⁷ In the attempt, by means of ballot, to disqualify those who had been favourable to the government of Cromwell from serving under Charles, Sir Robert was one of those whose downfall, along with that of Lauderdale, was particularly aimed at.⁸ This association with Lauderdale seems not to have been called for by the previous conduct, the party opinions, or the moral character of Sir Robert. Afterwards Lauderdale's aversion to so moderate and honest a man disturbed his councils, and was partly productive of his downfall. He joined the rising administration of Tweeddale; and having at the Restoration been re-appointed a lord of session, was promoted to be justice-clerk. "The people were pleased and gratified," says Laing, "when a judicial office, so important and dangerous, was conferred on the most upright and accomplished character which the nation produced."⁹ But Sir Robert was made justice-clerk, not to be a judge, but that the salary might induce him to be a partisan. He never sat on the bench, and was probably quite ignorant of law. Meanwhile, in 1662, took place the most important event in his life, and one of the most interesting transactions of the period. He was one of the leaders of that body of naturalists and philosophers who, with the assistance of Lord Brouncker and Robert Boyle, procured for the Royal Society the sanction of a charter. The society had existed as a small debating club previous to the republic, at the establishment of which the members separated. At the Restoration they re-established themselves, and conducted their meetings and operations on a rather more extensive scale. On the 28th November, 1660, we find Sir Robert present at, probably, the first meeting where it was proposed "that some course might be thought of to improve this meeting to a more regular way of debating things; and that, according to the manner in other countries, where there were voluntary associations of men into academies for the advancement of various parts of learning, they might do something answerable here for the promoting of experimental philosophy."¹⁰ Sir Robert undertook to communicate the views of the society to the court, and at next meeting returned an answer indicative of encouragement from that quarter.¹¹ After rules for holding meetings, and for the appointment of office-bearers, were established, Sir Robert was successively chosen president during the first and second month of the existence of the society.¹² He was a member of almost all committees and councils, delivered several papers, prepared and exhibited experiments, and gave information in natural history, chiefly relating to the geology of Scotland. The charter was obtained on 15th July, 1662.

This useful and high-minded man died suddenly in June, 1673. Burnet says of this event: "He was the wisest and worthiest man of the age, and was as another father to me. I was sensible how much I lost on so critical a conjuncture, being bereft of the truest and faithfullest friend I had ever known: and so I saw I was in danger of committing great errors for want of so kind a monitor."¹ But the same partial hand, on all occasions graphic and rich in description, has elsewhere excelled its usual power in drawing the character of Sir Robert Murray. "He was the most universally beloved and esteemed by men of all sides and sorts of any man I have ever known in my whole life. He was a pious man, and, in the midst of armies and courts, he spent many hours a-day in devotion, which was in a most elevating strain. He had gone through the easy parts of mathematics, and knew the history of nature beyond any man I ever yet knew. He had a genius much like Peiriski as he is described by Gassandi. He was afterwards the first former of the Royal Society, and its first president; and while he lived he was the life and soul of that body. He had an equality of temper in him which nothing could alter: and was in practice the only stoic I ever knew. He had a great tincture of one of their principles: for he was much for absolute decrees. He had a most diffused love to all mankind, and delighted in every occasion of doing good, which he managed with great discretion and zeal. He had a superiority of genius and comprehension to most men, and had the plainest, but withal the softest way of reproving, chiefly young people, for their faults, that I ever knew of."²

MURRAY, WILLIAM, Earl of Mansfield, and lord chief-justice of the King's Bench, the fourth son of Andrew, Viscount Stormont, was born at Perth on the 2d March, 1704.³ In 1719 he was admitted a king's scholar at Westminster. On the 18th June, 1723, he entered Christ Church, Oxford, having been first in the list of those promoted to the university. In 1730 he visited the Continent, after having graduated as Master of Arts; and on his return was called to the bar at Michaelmas term, 1731. As a school-boy and student he gained prizes, and is said to have shown promise of literary distinction; while, even after having joined his profession, he did not appear to direct his powers to the acquisition of legal knowledge. The office of a special pleader frequently damps the energy of talents formed to reflect honour on the bar or the bench; and Murray, along with many who have, and many who have not, been able to surmount the rigid barrier to the pursuit in which their talents made them capable of shining, was generally esteemed more fitted for a scholar than a lawyer. It is probable that the success of his first attempts showed him how successfully he might employ his energies in this direction. He was early engaged in a few important appeals, his appearances in which brought so speedy an accumulation of business, that it is said to have been remarked by himself, that he never knew the difference between absolute want of employment and a professional income of £3000 a-year. He soon threw the whole powers of his mind into the most minute acquirements necessary to procure eminence as a speaker, and is known to have been caught practising gesture before a mirror, with his friend Pope at his side acting as teacher of elocution. His intimacy with the illustrious poet probably commenced in similarity of pursuits (for Murray wrote poetry in

his youth, which has fallen into probably merited oblivion), and was fostered by the absence of rivalry in after-life. Pope condescended to turn his verses into compliments on his forensic friend, and the latter must have felt what the Roman has so well described, "pulchrum est laudari a laudato." It would be difficult to conceive a greater incentive to the rising ambition of an aspiring mind than these concluding lines:—

"Graced as thou art with all the power of words,
So known, so honoured, in the House of Lords—
Conspicuous scene! another yet is nigh,
More silent far, where kings and poets lie:
Where Murray (long enough his country's pride)
Shall be no more than Tully or than Hyde."

Like Lord Eldon, he made the first exhibition of his full power in commanding a jury from the accidental illness of his senior counsel—a circumstance which happened in the action for criminal conversation brought by Theophilus Cibber against Mr. Sloper. He requested a postponement for an hour, and never being void of self-possession except when personally attacked, he omitted nothing which his opportunities enabled him to accomplish, and made an impressive charge, which produced a decided effect in favour of his client. He was soon after employed in a professional service which may be said to have been in defence of his native country. When, after the murder of Porteous, the lords passed and sent down to the commons a bill for disqualifying and imprisoning the provost of Edinburgh, abolishing the city guard, and taking away the gates of the Netherbow port, he, assisted by Barnard, Shippen, Ogellthorpe, and most of the Scots members, pertinaciously resisted the insulting measure through a stormy conference, and was partly the means of lopping away the portion most offensive to the public; and the bill as returned and passed by the lords merely disqualified the provost, and imposed a fine of £2000 on the city for the benefit of the widow of Porteous. Murray's services on this occasion were rewarded by the freedom of the city of Edinburgh, which was presented to him in a gold box.⁴

In 1743 the attention of a ministry, not supported by extensive political talent, and obliged to combat with strong adversaries, was directed towards Mr. Murray as an effective auxiliary. He was chosen solicitor-general, and being thus initiated as a responsible legislator, was one of the few lawyers whose genius proved as great in the senate as it had been at the bar. In 1742 he took his seat in the house as member for Boroughbridge. In 1746 he was *ex officio* one of the counsel against the rebel lords. It is said that he performed an unwelcome duty. He certainly exhibited a disposition to act as a high-minded public prosecutor ought always to do, by showing that he was rather the instrument through which the law acted in doing justice than a person employed to procure the punishment of a fellow-citizen. "Every gentleman," he observed, choosing the collective term as the least invidious mode of expressing his own feelings, "who has spoken in this trial, has made it a rule to himself to urge nothing against the prisoner but plain facts and positive evidence without aggravation." Whether he acted from principle, or a secret leaning towards the cause he ostensibly opposed, is not likely to be ever known; but those who brought the accusation against him should have founded it on different evidence from the circumstance, that, as crown counsel, he was unwilling to stretch the law against the accused. The humbled Lord Lovat, the person on whose trial he made the above remark, in a fit of liberality or

⁴ *Coxe's Walpole*, i. 495.

national feeling, made the following observations on the solicitor in his defence:—"I am very sorry I gave your lordships so much trouble on my trial, and I give you a million of thanks for being so good in your patience and attention while it lasted. I thought myself very much loaded by one Mr. Murray, who, your lordships know, was the bitterest enemy there was against me. I have since suffered by another Mr. Murray, who, I must say with pleasure, is an honour to his country, and whose eloquence and learning are much beyond what is to be expressed by an ignorant man like me. I heard him with pleasure, though it was against me. I have the honour to be his relation, though perhaps he neither knows it nor values it. I wish that his being born in the north may not hinder him from the preferment that his merit and learning deserve. Till that gentleman spoke, your lordships were inclined to grant my earnest request, and to allow me farther time to bring up my witnesses to prove my innocence; but it seems that has been overruled."¹ But one who was present, and who has dipped his pen in gall, has given a less pleasing account than that generally believed, of his conduct at these trials. Horace Walpole says, in a letter to Horace Man, "While the lords were withdrawn, the solicitor-general Murray (brother of the Pretender's minister) officiously and insolently went up to Lord Balmerino, and asked him how he could give the lords so much trouble, when his solicitor had informed him that his plea would be of no use to him? Balmerino asked the bystanders who this person was? and being told, he said, 'Oh, Mr. Murray! I am extremely glad to see you: I have been with several of your relations: the good lady, your mother, was of great use to us at Perth; are not you charmed with this speech: how just it was!'"

But Murray did not escape charges of disaffection more apparently serious. A dinner had been given by the Dean of Durham on occasion of the king's birthday, when a conversation was commenced by an individual of the name of Fawcett, an old class-fellow of Murray, as to the probable preference of Johnson, a mutual friend, then Bishop of Gloucester. On this occasion Fawcett observed that "he was glad Johnson was so well off, for he remembered him a Jacobite several years ago, and that he used to be with a relation of his who was very disaffected, one Vernon Mercer, where the Pretender's health was frequently drunk." On a ministerial inquiry the charge of drinking the Pretender's health was transferred to Murray, and the matter became the subject of an accusation before the cabinet council. Murray was the intimate friend and companion of Vernon's eldest son, and had so established himself as a virtual brother to the young man, that the father, on his son's death, left to Murray a considerable fortune.² This man was a Jacobite. The university of Oxford was at that period a nest of traitors; and, taking into view Murray's family connections, his youth, his ardour, and the circumstance that he must have been aware that almost every noble family in Britain then conducted a correspondence with the exiled Stuarts, no man was more likely to have drunk the Pretender's health in a moment of conviviality. However, he denied the charge, stating his loyalty towards the existing government, which, by the time he was made solicitor-general, was probably sincere. Inquiry was stifled, and nothing was proved to the public on either side. But the accusation was never entirely dropped by his opponents; every one knows the use made of it by Junius. Pitt would use it to poison the sharpest darts of his elo-

quence, and on such occasions Murray is said to have felt, but never to have dared to answer. Pitt had been detailing some symptoms of Jacobitism which he had seen at Oxford. Horace Walpole says on this occasion,³ "Colours, much less words, could not paint the confusion and agitation that worked in Murray's face during this almost apostrophe. His countenance spoke everything that Fawcett had been terrified to prevaricate away." On another occasion the scene is thus told: "After Murray had suffered for some time, Pitt stopped, threw his eyes around, then fixing their whole power on Murray, said, 'I must now address a few words to Mr. Solicitor: they shall be few, but they shall be daggers.' Murray was agitated: the look was continued; the agitation increased. 'Judge Festus trembles,' exclaimed Pitt, 'he shall hear me some other day.' He sat down, Murray made no reply, and a languid debate is said to have shown the paralysis of the house."⁴ It may be well here to give the picture which Walpole has furnished us of Murray and his two great rivals in oratory, Pitt and Fox. The picture is beautiful, and though too glaringly coloured must be to a certain extent founded on truth. "Murray, who at the beginning of the session was awed by Pitt, finding himself supported by Fox, surmounted his fears, and convinced the house, and Pitt too, of his superior abilities. He grew most uneasy to the latter. Pitt could only attack, Murray only defend. Fox, the boldest and ablest champion, was still more formed to worry, but the keenness of his sabre was blunted by the difficulty with which he drew it from the scabbard: I mean the hesitation and ungracefulness of his delivery took off from the force of his arguments. Murray, the brightest genius of the three, had too much and too little of the lawyer; he refined too much, and could wrangle too little for a popular assembly. Pitt's figure was commanding; Murray's engaging from a decent openness; Fox's dark and troubled; yet the latter was the only agreeable man. Pitt could not unbend; Murray in private was inelegant: Fox was cheerful, social, communicative. In conversation none of them had wit: Murray never had: Fox had in his speeches, from clearness of head and asperity of argument. Pitt's wit was genuine, not tortured into the service, like the quaintnesses of my Lord Chesterfield."⁵

On the accession of the Duke of Newcastle's ministry, in 1754, Mr. Murray was advanced to the office of attorney-general, in place of Sir Dudley Ryder, who was made chief-justice of the Court of King's Bench. It was at that period whispered that the highest honours to which a British statesman can be presumed to aspire were almost within the grasp of Murray, but that he declined a contest for any distinction which was not professional. His character presents a strange mixture of eager, unremitting ambition, with an unwillingness to grasp the highest objects within his reach, probably from a mental misgiving as to his ability to perform the part of leader. In pursuance of this feeling, on the death of Sir Dudley Ryder, in 1756, he followed him as chief-justice of the King's Bench, the post to which he always looked as the most desirable, and which he preferred to the labours and responsibilities of the chancellorship or premiership. He probably had no wish to remain longer a member of such a government as Newcastle's; but that weak head of a cabinet had sufficient wisdom to calculate the loss of such a man as Murray, and extravagant offers are said to have been

made to induce him to remain for some time a working partisan of the ministry. In his promotion, however, he does not seem to have wished to relinquish the honours of administration, while he eschewed the responsibility. Contrary to custom, but not to precedent, he remained a member of the cabinet, and changed his sphere of action for the House of Lords, with the title of Baron Mansfield of Mansfield, in the county of Nottingham. On his taking leave of the society of Lincoln's Inn he received the usual congratulatory address, which was presented by the Honourable C. York, son to Lord Hardwicke.

Let us now cast a glance at Lord Mansfield's character and services to the public as a judge. It is in this capacity that we will find the only practical memorial which he has left for posterity; but it is such a memorial as few, if any other judges, have left. The declaration of what the law is, is generally thought sufficient duty for a judge, and he is praised if he does it well—the evils which his train of decisions may have produced to posterity, when their principle was applied to other cases, are not to be attributed to him; he was not prophetic, and could not foresee such events. But Lord Mansfield, in more than one branch of law, framed his decisions for the advantage of posterity; and of the law of marine insurance which is now a vast system both in England and Scotland, he may be said to have been the framer. On this subject, the opinion of one of the most ample writers on the English law of marine insurance will best explain what Lord Mansfield accomplished. "Before the time of this venerable judge, the legal proceedings, even on contracts of insurance, were subject to great vexations and oppressions. If the underwriters refused payment, it was usual for the insured to bring a separate action against each of the underwriters on the policy, and to proceed to trial on all. The multiplicity of trials was oppressive both to the insurers and insured; and the insurers, if they had any real point to try, were put to an enormous expense before they could obtain any decision of the question which they wished to agitate. Some underwriters, who thought they had a sound defence, and who were desirous of avoiding unnecessary cost or delay to themselves or the insured, applied to the Court of King's Bench to stay the proceedings in all the actions but one, undertaking to pay the amount of their subscriptions with costs, if the plaintiff should succeed in the cause which was tried; and offering to admit, on their part, everything which might bring the true merits of the case before the court and jury. Reasonable as this offer was, the plaintiff, either from perverseness of disposition or the illiberality or cunning of his advisers, refused his consent to the application. The court did not think themselves warranted to make such a rule without his consent; but Mr. Justice Denison intimated, that if the plaintiff persisted, against his own interest, on his right to try all the causes, the court had the power of granting imparlances in all but one, till there was an opportunity of granting that one action. Lord Mansfield then stated the great advantages resulting to each party by consenting to the application which was made; and added, that if the plaintiff consented to such a rule, the defendant should undertake not to file any bill in equity for delay, nor to bring a writ of error, and should produce all books and papers that were material to the point in issue. This rule was afterwards consented to by the plaintiff, and was found so beneficial to all parties, that it is now grown into general use, and is called the consolidation rule. Thus, on the one hand, defendants may have ques-

tions of real importance tried at a small expense; and plaintiffs are not delayed in their suits by those arts which have too frequently been resorted to, in order to evade the payment of a just demand.¹ Such is one out of the several judicial measures by which Lord Mansfield erected this great system. But it is said that he made the changes in the law, by changing himself from the administrator of the law into the legislator; that he did not adhere to the letter of the law, but gave it an equitable interpretation, virtually altering it himself, in place of leaving to the legislature the correction of bad laws, a system which, whatever good use he might himself have made of it, was not to be intrusted to a chief-justice, and never was so by the law of England. The charge is not without foundation. Junius says to him, in his celebrated letter of 14th November, 1770, "No learned man even among your own tribe thinks you qualified to preside in a court of common law. Yet it is confessed that, under Justinian, you might have made an incomparable pretor." The Roman law was, in all its branches, the excess of equity, even when compared to the equity court of England; but the pretorian branch was the equity of the Roman law. It is probable that the institute was at all times a more pleasing study to the elegant mind of Lord Mansfield, than the rigid common and statute law of England. He frequently made reference to it, and may have been induced to study it in incapacitating himself for pleading Scotch appeals; yet he is understood to have been the author of the chapter in Blackstone's *Commentary* which answers the arguments of Lord Kames in favour of the extension of equity in England. His opinions on the rights of jury trials in cases of libel have met with still more extensive censure. He maintained "that the printing and sense of the paper were alone what the jury had to consider of." The intent with which this was done (as it is singularly termed the law) he retained for the consideration of the court. In the cases of *Almon* and of *Woodfall* he so instructed the jury. In the latter case the verdict was, "guilty of printing and publishing only." There was no charge, except for printing and publishing, in the information, the intent being for the consideration of the court. On the motion for arrest of judgment, it is clear from Lord Mansfield's opinion, that, had the verdict been "guilty of printing and publishing," he would have given judgment on the opinion of the court as to intent; but the word "only" was a subject of doubt, and a new trial was ruled.² The verdict in this case was "not guilty." Lord Mansfield could not prevent such a verdict without unconstitutional coercion; but he accommodated it to his principles, by presuming that the meaning of such a verdict was a denial as to the *fact* of printing and publishing, and that the juror who gave it in consideration of the *intent*, perjured himself. Yet Junius accomplished a signal triumph over him, in making him virtually contradict his favourite principle in a theory too nice for practice, when he said, that "if, after all, they would take upon themselves to determine the law, *they might do it*; but they must be very sure that they determined according to law: for they touched their consciences, and they acted at their peril." A declaratory act introduced by Fox, has since put a stop to the powers of a judge to infringe in a similar manner the rights of juries.³ In only two instances has Lord Mansfield been accused of wilfully perverting his judicial authority. In the *Douglas* cause, it must be admitted that his address

to the house was more like the speech of an advocate than of a judge. It is believed to have swayed the house, although the decision was not, as in the general case, unanimous in favour of the side taken by the law officer who gives his opinion. Mr. Stuart, the agent for the losing party, wrote letters to Lord Mansfield, solemnly charging him with improper conduct as a judge. Of these very beautiful specimens of composition it is scarcely possible to judge of the merit, without a knowledge of the elaborate cause with which they are connected; but the reasoning is clear and accurate, and the calm solemnity of the charges, with the want of that personal asperity, or dependence on satirical or declamatory powers, which appear in Junius, must have made these letters keenly felt, even by a judge conscious of rectitude. The other charge was brought against him by Junius, for admitting to bail a thief caught in the manner, or with the stolen property, contrary to law. The thief was a man of large property, his theft trifling, and probably the consequence of a species of mental disease of not unfrequent occurrence. The reason of granting bail was, we believe, to enable him to dispose of his property to his family; and the act probably one of those in which the lord chief-justice stretched the law to what he conceived a useful purpose.

A brief narrative of Lord Mansfield's political proceedings while on the bench will suffice, as their merits are matter of history. He attended the meetings of the council from 1760 to 1763, when he declined attending, from not agreeing with the measures of the Duke of Bedford. In 1765 he returned, but again retired within the same year on the formation of the Rockingham administration. On the dismissal of Mr. Pitt the seals of the chancellorship of the exchequer, from which Mr. Legge had retired, were *pro tempore* placed in his hands. When Lord Waldegrave was directed to form a new administration, he was employed to negotiate with the Duke of Newcastle and his opponent Pitt; but the conclusion of the treaty was intrusted to the Earl of Hardwicke. On the resignation of Lord Hardwicke several attempts were made to prevail on Mansfield to succeed him as chancellor; but the timidity before explained, or some principle not easily defined, induced him to decline the preferment. He strongly resisted an attempt to amend the application of *Habeas Corpus* to cases not criminal, suggested from the circumstance of a gentleman having remained for a considerable period in prison, to which he was committed for contempt of court. "On this occasion he spoke," says Horace Walpole, "for two hours and a half: his voice and manner, composed of harmonious solemnity, were the least graces of his speech. I am not averse to own that I never heard so much sense and so much oratory united." This was an occasion of which Junius made ample use. The amendment was rejected, and a similar legislative measure was not passed until 1816. Lord Mansfield was not less eloquent in supporting the right of Britain to tax America without representation; he maintained the plea that there was virtual, though not nominal, representation, and urged decisive measures. "You may abdicate," he said, "your right over the colonies. Take care, my lords, how you do so, for such an act will be irrevocable. Proceed then, my lords, with spirit and firmness; and when you have established your authority, it will then be time to show your lenity." But if his views in civil politics were narrow and bigoted, he was liberal in religious matters, and both as a judge and a legislator afforded toleration to all classes of dissenters, from Roman

Catholics to Methodists. He was indeed a greater enemy to liberal institutions than to liberal acts. He could bear to see the people enjoying privileges, provided they flowed from himself, but he did not wish them to be the custodiers of their own freedom. In spiritual matters the authority did not spring from the chief-justice. When he left Pitt behind him in the Commons, he found one to act his part in the House of Lords. Lord Camden was his unceasing opponent; and Mansfield was often obliged to meet his attacks with silence. He suffered severely in the riots of 1780—his house, with considerable other property, being destroyed; while he suffered the far more lamentable loss of all his books and manuscripts. In pursuance of a vote of the House of Commons, the treasury made an application for the particulars and amount of his loss, for the purpose of arranging a compensation; but he declined making any claim. In 1788 he retired from his judicial office, when the usual address from the bar was presented to him by his countryman, Mr. Erskine; and in July, 1792, he was raised to the dignity of Earl of Mansfield, with remainder to his nephew, David Viscount Stormont. He died on the 20th March, 1793, in the eighty-ninth year of his age.

MYLNE, ROBERT, a distinguished architect, was born in Edinburgh, January 4, 1734. He was the son of Thomas Mylne, a magistrate of the city, and an architect, whose predecessors for several generations had been master-masons to the king, and one of whom built the additions to Holyrood House in the reign of Charles II., and is interred in the neighbourhood of that palace, with a highly panegyrical epitaph. After receiving a general education in Edinburgh, the subject of this article travelled on the Continent for improvement in his hereditary science. At Rome, where he resided five years, he gained in 1758 the first prize of the academy of St. Luke in the first class of architecture, and was unanimously elected a member of that body. In the course of his travels he was able, by the minuteness of his research, to discover many points in ancient architecture which no one ever before or ever after remarked, and to illustrate by this means some obscure passages in Vitruvius. On returning to London a friendless adventurer, the superiority of a plan which he presented, among those of twenty other candidates, for the contemplated Blackfriars' Bridge, gained him the employment of superintending that great public work, which was commenced in 1761. This plan and the duty of superintendence were rewarded, according to agreement, by a salary of £300 a year, and five per cent. upon all the money expended. So well had he calculated the cost, that the bridge was completed (1765) for the exact sum specified in the estimate, £153,000. As a specimen of bridge architecture on a large scale, it was long held in the very highest rank; and a learned writer has even pronounced it the most perfect in existence. The mode of *centering* employed by Mr. Mylne has, in particular, been the theme of much praise.

This eminent architect was afterwards appointed surveyor of St. Paul's Cathedral; and he it was who suggested the inscription in that building to the memory of Wren—"Si monumentum queris, circumspice"—an idea so felicitous, that it may safely be described as more generally known, and committed to more memories, than almost any similar thing in existence. Among the buildings erected or altered by him may be mentioned—Rochester Cathedral, Greenwich Hospital (of which he was clerk of the works for fifteen years), King's Weston, Ar-

dencaple House, and Inverary Castle. He was a man of extensive knowledge in his profession, both in regard to its theory and practice. After a long career of distinguished employment, he died May 5, 1811, in his seventy-eighth year, at the New River

Head, London, where he had long resided as engineer to that company, and was interred in Westminster Abbey, near the tomb of Sir Christopher Wren. By his wife, Miss Mary Home, whom he married in 1770, he had nine children, five of whom survived him.

N.

NAIRN, CAROLINA, BARONESS. This amiable and talented poetess was the third daughter and fifth child of Laurence Oliphant, of Gask; her mother was Margaret Robertson, daughter of Duncan Robertson, of Struan, and granddaughter of the fourth Lord Nairn. The family of Gask was distinguished for its Jacobitism, and the poetess was named Carolina in honour of Charles Edward, the young Chevalier. She was born in the family mansion of Gask, county of Perth, on the 16th of July, 1766. In her youth Carolina was so distinguished for her beauty, that in her own district she was commonly termed "The Flower of Strathearn." But her early talents were still more remarkable than her beauty, while the picturesque scenery of her birth-place, and the romantic incidents with which the history of her ancestors had been connected, tended to direct them towards poetry. It is not impossible also that the example of her kinsman Robertson of Struan, the distinguished Jacobite chief and poet, may have aided this tendency. Carolina Oliphant was also one of the many proofs that poetry comes by birthright rather than acquirement, for her precocious talents, even in early girlhood, expressed themselves in numbers, and some of her songs, which became popular, were written at a time of life when others of her sex and station have not yet been freed from the governess or the school-room.

It was not, however, enough for Miss Oliphant to win the renown of a successful and popular songwriter. High as that ambition may be in the eyes of those who would rather be the authors of a country's songs than its laws, her ambition was loftier and purer still. Scotland was already a country of songs; but however ennobled they might be by the charms of poetry, they were also in many cases disfigured by licentiousness; and what the ear so alluringly heard, the heart was too ready not only to tolerate but adopt. Thus it was in the days of the Wedderburns, and thus it was until the close of the last century; so that the popular songs and ballads of the olden time furnished in their practical effects abundance of repulsive work for the discipline of the kirk session. Not merely new songs had therefore to be created, but the old driven out; and to supersede the latter not only by a purer morality but a higher attractiveness was the aim of Carolina Oliphant. And nobly and well did she fulfil her task. She led the way of a great national reformation which others have continued to the present hour, so that not only in the excellence and abundance, but also the morality, of its songs, Scotland may vie with any nation whatever. And what has become of the old national ditties which were equally popular in hall and hut, and sung alike by princes and peasants without a blush? The ear can no longer endure them, the popular suffrage has condemned them beyond repeal, and they can only be found among the recollections of the past or the repertoires of the antiquary.

Her first composition in Scottish verse that

obtained publicity is supposed to have been *The Ploughman* [Ploughman], which she sent anonymously to the president of an agricultural dinner in the neighbourhood. The song was publicly read and applauded, and speedily set to music. A series of others followed during the course of her long extended life, which, in consequence of being given without her name, it would be as difficult to enumerate as to identify; but it is enough to state that, notwithstanding the disadvantage of being unacknowledged productions on the part of their author, they established themselves as popular melodies, and have thus continued to the present hour. We have only to mention in proof of this, her *Laird o' Cockpen*, and *The Land o' the Leal*, which were as popular at the close of the last century as they are in our own day. Another was *Callin' Herrin'*, which Niel Gow has set to such exquisite music, and which is still as fresh in popularity as when it welcomed the coming of the first creel from Newhaven to Edinburgh. Another was the Jacobite song *Il's over the Hills that I lo'e weel*, which still stands by its own merits, although the subject of its eulogy is no longer cared for. Of the same class is *The Hundred Pipers*, a song descriptive of the young Chevalier and his army crossing the Esk; and dancing their clothes dry when they had reached English ground on the opposite side.

While the young and beautiful poetess was thus charming a whole nation with her lyrics, there were many suitors for her hand; but she remained unmarried to the age of forty, when, in 1806, she accepted William Murray Nairn, her maternal cousin, who was a major in the army, and held the office of assistant inspector-general of barracks in Scotland. He would have been Baron Nairn, but for the attainer of the title on account of the Jacobitism of its previous holder. The time, however, had arrived for the reversion of these harsh sentences; and George IV., on his visit to Edinburgh, having learned that the song of *The Attainted Scottish Nobles* had been written by Mrs. Nairn, restored her husband's title by act of parliament in 1824. Only a short time, however, was this restitution enjoyed, for on the 9th of July, 1830, he died, and the baroness, who had proved an affectionate wife, was left in widowhood. One consolation remained to her in her son William, her only child, born in 1808, who at the age of twenty-two succeeded to his father's title, and to whom she was affectionately devoted. A severe attack of influenza in 1837 induced him to try the remedy of a change of air upon the Continent, and he repaired with his mother to Brussels; but there he was seized with a violent cold, which carried him off in six weeks. Bereaved of those whom she had most tenderly loved, and left in her old age to solitude, she wept, but not as those who have no hope; and while she bewailed her loss in the language that was natural to her by more than one mournful lyric, she addressed herself to the performance of those Christian duties in which she found her best consolation.

One of these pathetic songs, to the air of *Aileen Aroon*, and entitled, *Would You be Young Again?* which she wrote in 1842, at the age of seventy-six, and indicative alike of her sorrows and hopes, we cannot refrain from quoting—

"Would you be young again?
So would not I—
One tear to memory given,
Onward I'd hie,
Life's dark flood forded o'er,
All but at rest on shore,
Say, would you plunge once more
With home so nigh?"

"If you might, would you now
Retrace your way,
Wander through stormy wilds,
Faint and astray?
Night's gloomy watches fled,
Morning all beaming red,
Hope's smiles around us shed,
Heavenward—away."

"Where, then, are those dear ones,
Our joy and delight?
Dear and more dear, though now
Hidden from sight.
Where they rejoice to be,
This is the land for me;
Fly, time, fly speedily;
Come, life and light."

After her marriage there was an intermission in Lady Nairn's poetical studies, and for this, her devotedness as a wife and mother perhaps formed her best apology. Thus her life passed tranquilly onward until 1821, when a new call summoned her powers into action. In that year Mr. Robert Purdie, a music-seller in Edinburgh, having resolved to publish a collection of our best national songs, applied to several ladies distinguished for their musical talents to assist him in the arrangement of the melodies; and as they had enjoyed the intimacy of the baroness, and were aware of the great popularity which her Scottish songs had obtained, they urged her to contribute to such a laudable scheme. She consented, but it was on condition that the fact of her contributing should be kept a profound secret. The work was commenced, and when completed in 1824, consisted of six volumes of royal octavo, under the title of the *Scottish Minstrel*, forming one of the best and largest collections of our Scottish songs. But while the work obtained the extensive popularity it merited, the public was clamorous to know who was the author of those distinguished contributions—for in her correspondence with Mr. Purdie, her only signature was the letters B. B. The publisher was non-plussed, and the editor mystified, until the former, conceiving that B. B. could stand for no other than Mrs. Bogan of Bogan, addressed her subsequently by that title. But the curiosity of the public was equally stimulated to discover the author of those admirable songs, and many were the theories on the subject maintained in the journals of the day. Strange that a secret confided to more than one lady never leaked out! But secrecy is a quality possessed not only by Scottish men but Scottish women also, as not only the present case, but the Porteous conspiracy and the concealments of the young Chevalier, have well attested. By her express desire even her sex was concealed, and while she left the publisher undisturbed in his mistake that her real name was Mrs. Bogan of Bogan, she desired him not to reveal that the writer of these songs was a woman. He obeyed, and in the advertisement to the last volume of the *Scottish Minstrel* was the following guarded acknowledgment—"In particular the editors would have felt happy in being permitted to enumerate the many original and beautiful verses that adorn their pages, for which they are indebted

to the author of the much-admired song *The Land o' the Leal*, but they fear to wound a delicacy which shrinks from all observation." Even to the close of her life this sensitive delicacy continued, so that only a few were aware that she was the authoress of the above-mentioned song, or even that she had ever written a single verse of poetry. To her, the purification of the minstrelsy of her native land, and change of its noxious waters into a stream of life, outweighed all earthly fame.

After the death of her son, and till within two years of her own death, Lady Nairn resided on the Continent, and partly in Paris. Her health had suffered during the last years of her life, and latterly she was compelled to use a wheeled chair. Some years after her death it occurred to her friends that she had retained her *incognita* too scrupulously, and they were desirous to publish a collected edition of her works; but this was only partially accomplished in an elegant folio, entitled "*Lays from Strath-earn*," by Carolina, Baroness Nairn. Arranged with Symphonies and Accompaniments for the Piano-forte, by Finlay Dun." A very large portion, however, of her songs are still in manuscript. In addition to her poetical talents, she was an enthusiast in music, and showed great taste and skill in the art of drawing. The same high philanthropy which animated her attempt to purify our national melodies, exerted itself in deeds of Christian liberality and benevolence; but the same retiring delicacy which characterized her as a poetess also distinguished her as a benefactor, so that the world was kept in ignorance of her beneficence both to public charities and individuals. One evidence of her liberality in contributing to the religious instruction of the lower orders, was thus specified by Dr. Chalmers at the close of 1845, in reference to his West Port institution—and it may serve as a specimen of many such actions in which her agency remained unknown. "Let me speak now," said the eloquent affectionate orator and venerable divine, "as to the countenance we have received. I am now at liberty to mention a very noble benefaction which I received about a year ago. Inquiry was made to me by a lady, mentioning that she had a sum at her disposal, and that she wished to apply it to charitable purposes; and she wanted me to enumerate a list of charitable objects, in proportion to the estimate I had of their value. Accordingly I furnished her with a scale of about five or six charitable objects. The highest in the scale were those institutions which had for their design the Christianizing of the people at home; and I also mentioned to her, in connection with the Christianizing at home, what we were doing at the West Port; and there came to me from her, in the course of a day or two, no less a sum than £300. She is now dead; she is now in her grave, and her works do follow her. When she gave me this noble benefaction, she laid me under strict injunctions of secrecy, and, accordingly, I did not mention her name to any person; but after she was dead I begged of her nearest heir that I might be allowed to proclaim it, because I thought that her example, so worthy to be followed, might influence others in imitating her; and I am happy to say that I am now at liberty to state that it was Lady Nairn of Perthshire. It enabled us, at the expense of £330, to purchase sites for schools and a church; and we have got a site in the very heart of the locality, with a very considerable extent of ground for a washing-green, a washing-house, and a play-ground for the children, so that we are a good step in advance towards the completion of our parochial economy."

It only remains to be added to this brief notice,

that Carolina Baroness Nairn died at the mansion of Gask, on the 27th of October, 1845, at the age of seventy-nine years.

NAPIER, ADMIRAL SIR CHARLES. This great naval hero was a member of that family of Napiers who made themselves so illustrious in the present century, not only by their achievements but their writings. He was the second son of the Hon. Captain Charles Napier, R.N., and grandson of Francis the fifth Lord Napier: his uncle was the Hon. Colonel George Napier, and thus he was full cousin to the hero of Scinde and also to the historian of the Peninsular war. He was born on the 6th of March, 1786, at his father's residence, Merchiston Hall, near Falkirk, in the county of Stirling. As child and boy his choice of the profession in which he was to win such distinction was indicated by his wistful watching of the barges in the canal near his father's house, and by constructing and rigging boats and ships, which he set a-sailing in the canal or garden pond. At the early age of seven years he was sent to the high-school of Edinburgh, where he continued six years, and here his studies of the classics were alternated with those pursuits which were in keeping with his future character and career. In the battles or "bickerings" of the high-school boys against the lads of the city, he was always a chief leader, and one of the foremost of the combatants; and during the short intervals of truce he was wont to adjourn to Leith and study every vessel in the harbour. Even at this age also he was neither insensible to any distinction he had won, nor slow to proclaim it; and having on one occasion attained the high station of *dux*, or head of his class, he hired a sedan chair, that he might be carried in triumph to his father's house in George's Square.

At length the time came when Charles Napier was to announce his choice of a profession: he had decided to be a sailor, and was impatient to be afloat. But his father, a disappointed post-captain, was hostile to such a choice, and likely to nip it in the bud. Charles, however, had his class-fellows on his side, and they resolved to accompany him to his father's house, in the hope of melting the stern parent by their united eloquence. They accordingly proceeded to George's Square, and entered the grim commander's study, who was astonished to be thus boarded, and his anger was not abated when the purpose of their visit was announced. He gruffly, and in the briefest terms, declared that his son should never enter the navy, and the discomfited striplings backed out of his presence. Very soon, however, Captain Napier relented; he seems to have found it useless to strive against nature; and Charles was accordingly entered as a midshipman on board the *Martin*, lying in Leith Roads. This was in November, 1799, when young Napier was in the fourteenth year of his age. It was fortunate for the service, as well as for Charles, that he was soon after removed to another vessel, for in her next cruise, the *Martin*, after having put to sea, was never more heard of.

Having been transferred to the *Renown*, then lying at Spithead, in May, 1800, Charles Napier went in a coasting vessel to London, for the purpose of joining his ship, and was landed with his luggage at the Tower Stairs. Having heard terrible stories of the London sharpers, he put himself on his guard; and no sooner did the eager porters lay hold of his luggage in the hope of getting a job, than, thinking that they meant to rob him, he planted himself astride upon his sea-chest, drew his dirk, and dared them to touch his property. A still more remarkable in-

stance of the boy's courage occurred at the Tower, to see the wonders of which he was taken during his short stay in London. When the lions were exhibited, the keeper eulogized one of them as being so very tame that, said he, "you might put your hand into his mouth." This was a safe hyperbole, as no one was likely to test it; but Charles Napier, not content with the mere assertion, thrust his hand into the animal's jaws. It was well that the king of brutes was either in a wonderfully clement humour, or taken at unawares by the strangeness of such a freedom, for the experimenter was allowed to remove his hand with impunity, while the only fear exhibited was on the part of the by-standers.

After joining the *Renown*, 74, the flag-ship of Sir Borlase Warren, the young midshipman was employed in various services and on different stations, until in 1805 he was acting-lieutenant on board the *Mediator* in the North Sea. His apprenticeship was now ended, and he had obtained a rank in which he could show what he was worth. He signaled himself in an attack upon part of the Boulogne flotilla, and volunteered to attempt its entire destruction by means of rocket-boats, but this daring proposal of a young officer only in his nineteenth year was not followed up. In the same year [1805], after passing his examinations, he was promoted to the rank of lieutenant, and in 1807 to that of commander. The first vessel placed under his command was the brig *Pultusk*, and being thus let loose into action on his own responsibility he was not slow in using his commission. He landed on the Spanish main with only twelve men, and captured a guarda-costa which he had chased ashore, although it was defended by three or four small guns which she had landed, and thirty-six men of her crew. He also landed and took a battery on the coast of Porto-Rico, and a merchant schooner, the crew of which fled after firing their guns. In the following year he was transferred into the *Recruit*, of 18 guns, and soon after had a warm engagement with the French corvette *Diligente*, of 22 guns, to windward of Antigua. The fight lasted nearly three hours; the second shot fired by the enemy broke Napier's thigh, so that the bone perforated the flesh; his first lieutenant was mortally wounded soon after, and out of a crew of 106 men the *Recruit* had six killed and twenty-three wounded. But just at the moment when her victory appeared certain, her mainmast fell, and the *Diligente* sheered off and escaped. In three months Napier recovered from his wound, but not from its effects, as the injured leg was somewhat contracted, which occasioned a slight limp in his walking for life. As prompt for enterprise as ever he returned to active duty, and under the command of Lord William Fitzroy took a part in the siege of Martinique. Anchoring close to Fort Edward, he suspected that it was either weakly garrisoned or abandoned, and suggested that it should immediately be stormed; and when doubts were expressed that the fort might be well manned and the enterprise dangerous, Napier offered to clear up the doubt by personal inspection. He went on shore in his ship's gig with four volunteers, scaled the wall, and finding his surmises correct, hoisted the British flag on the ramparts. Eight hundred British troops were immediately landed to take possession of the empty fort, its mortars were turned against the enemy, and from this point Fort Bourbon was so effectually shelled that it soon surrendered, and the capture of Martinique was secured.

Soon after this Napier was promoted to the rank of post-captain by Sir Alexander Cochrane, the admiral of the station. In April 14, 1809, while employed in the squadron of Sir Alexander Cochrane in

blockading the port of Guadeloupe, three French line-of-battle ships attempted to make their escape from the port, and succeeded by a strong breeze that was in their favour. Pursuit was immediately given by the British squadron, and foremost in the chase during the whole night was Napier's little 18-gun brig the *Recruit*. He also exchanged shots with the three vessels repeatedly, in spite of their terrible broadsides, by which he managed to interrupt their speed, and especially confined himself to their hindmost ship, the *D'Hautpoult*, the sailing of which he retarded so successfully, that her consorts, in order to save her, were obliged to haul-to and prepare for action. This pursuit and running fight, alternately following each other, continued for two days, during which the loud cannonading had directed the British ships on the enemy's track, and at last the *D'Hautpoult* was taken by two of our squadron, the *Pompeé* and *Castor*. During this protracted affair the skill with which Napier manœuvred his little vessel to escape the effects of the enemy's heavy metal, was still more admirable than his boldness in continuing so unequal a chase; after every broadside, in which the *Recruit* seemed to disappear, she was again upon another tack, and as buoyant as ever, and although she was crippled at last, she had only one man wounded. On the surrender of the *D'Hautpoult* to the captors, the French admiral on delivering up his sword desired to know the name of that little vessel which had so fatally delayed his movements; and on being told that it was the *Recruit*, he shook his head and replied, "That ship no recruit; it be one very old soldier." With his new rank of post-captain Napier came home in command of the *Fison*, but on his arrival was displaced from the command, although confirmed in his rank. Being thus thrown out of active service, and obliged to wait his appointment to a ship, he returned to Scotland, and became—a student at the university of Edinburgh! But a similar step had been taken a few years previous by Lord Cochrane, when the peace of Amiens threw him for a time out of naval employment. At college Napier attended the classes for modern languages, and those for history, chemistry, and mathematics. Amidst this variety he was also asked if he would attend the lectures on moral philosophy, at that time highly popular in Edinburgh. "I don't know what moral philosophy exactly means," replied the young captain, "but at any rate I'll have a rap at it also." The time that was not occupied in these studies he devoted to social amusements and field sports, in the last of which his eccentric proceedings furnished no little mirth to the whole field. He was a fearless but at the same time an awkward and careless rider, and being unable one day in the hunt to make his horse face a high fence, he wheeled about the animal, backed it against the obstacle, and drove it through stern foremost, splintering every bar in the way.

But neither the university nor field-sports were enough for the ardour of "Mad Charlie Napier," as he was called by his familiars; he longed for the smell of gunpowder, the roar of artillery, and the heady excitement of the fight; and being weary of waiting on for an appointment from the admiralty, he resolved to fill up the interval with a little amateur soldiering in the land service. As an additional inducement his three cousins, Charles, William, and George Napier, were serving in the army of the Duke of Wellington in Spain. Thither accordingly he went, and on the 25th of September, 1810, reached the British encampment at Busaco, where his three cousins were as much astonished at the arrival of "Black Charlie" (so called among the Napiers from

his dark complexion) as if he had dropped from the clouds. A hearty night's bivouac of frolic and feasting ensued, that was followed by the battle of Busaco, in the preliminary skirmishing of which "Black Charlie" was wounded in the leg by a musket bullet that went through the flesh of his thigh. Indifferent, however, to this accident, he served as a volunteer in the battle of the 27th, and was in the thickest of the fight from the beginning to the close, except during a short interval when he carried Major Napier (afterwards the hero of Scinde), who was dangerously wounded, to the rear. After the battle of Busaco, Charles accompanied the British army in its retreat to the lines of Torres Vedras; and having now acquired an amount of military experience which he was afterwards to make so available in the sea-service, he resolved to return home, and find occupation in his own way, with a view to which he wrote the following characteristic application to the admiralty:—"My leave of absence is just out. I don't think it worth remaining here, for I expect you will give me a ship, as I am almost tired of campaigning, which is a d——d rum concern." This unofficial, abrupt demand, which might have been roared through a speaking-trumpet, was apparently taken in good part at head-quarters; for on his return to England he was early in 1811 appointed to the *Thames*, a 32-gun frigate, which was commissioned for service in the Mediterranean.

Being once more afloat, Captain Napier was not likely to let slip an opportunity for action, and as often as this occurred, whether at sea or ashore, he illustrated his old family motto, "Ready, aye ready." Sometimes he acted alone, and sometimes in company with other ships, but always from the force of his character obtaining the leadership. After a fleet of thirty merchantmen had been driven into the small port of Infreschi on the 21st of July, 1811, he silenced eleven gun-boats by which the convoy was protected; and while the merchant ships were boarded and taken by Captain Clifford of the *Cephalus*, Napier landed at the head of the marines of his ship *Thames*, drove the enemy's sharp-shooters up the hills, and having seen the capture of the convoy secured, re-embarked with eighty-four prisoners, while the neighbouring hills were filled with armed men who could do nothing but look on. In the following November, being under the orders of Captain Duncan on the coast of Naples, he was employed in a land operation at Palinuro. Thirteen gun-boats and a number of merchant-vessels were in the harbour, which was also defended by a strong battery and tower, and a large body of troops lined the sides of a valley through which they thought the British must pass to the heights, while the heights were also manned with sharp-shooters. For this perilous adventure Napier, besides his seamen, had a detachment of 250 men of the 62d regiment. A path that was almost inaccessible being discovered, he judged it safer to take this route than advance through the fire of the valley, and his party thus succeeded in gaining the heights before the enemy could prevent them. They, however, compelled the boats which had landed the British to retire, who were thus isolated from co-operation by sea, and obliged to abide the attack of the enemy, who assailed them in great force. The British beat them back, but on the following day found their difficulties increased, and the enemy more numerous, while they were open also to the fire of the gun-boats in the port. Thus inclosed on all sides, Captain Napier caused himself to be lowered down the cliffs with ropes, and having reached his ship, both British vessels ran into the harbour with a favouring breeze, destroyed the batteries and gun-boats, captured the

convoy, and in the face of three times their number effected the rescue of their friends, and carried them off in safety.

On the 14th of May, 1812, Napier, accompanied by the brig *Pilot*, of 18 guns, attacked the port of Sapi. After a two hours' cannonade within pistol shot, a fort and battery were silenced, and twenty-eight merchant-vessels were carried off or destroyed; also some of them which were high and dry upon the shore nearly a quarter of a mile from the sea.

But the exploit at this time which gave him the greatest satisfaction was the capture of Ponza, the largest of a group of islands to the north of the Bay of Naples. To obtain possession of it was for various reasons important, but at the same time its garrison was strong, while the mole and harbour were defended by four batteries favourably situated for resistance. On being commissioned to effect the capture of the island, Napier waited for a few days until the weather should be propitious, and then stood towards the harbour, as if only in the act of cruising. But all at once he anchored unexpectedly in the mole, and opened such a sudden well-directed fire that not a man of the garrison could show his head, and the bewildered governor struck his colours. Thus a strong island, having a garrison of 180 soldiers besides its militia, was captured in a few minutes by the paralyzing suddenness of his attack, without the loss of a man to the assailants. Napier was justly proud of this achievement, the memory of which he cherished to his dying day; and many years afterwards, when he assumed the command of the Constitutional fleet of Portugal, he took from the island, as his *nom de guerre*, the title of Don Carlos de Ponza.

Soon after the taking of Ponza, Napier was transferred from the command of the *Thames* to that of the greatly-superior frigate *Euryalus*, of thirty-six 18-pounders; and in this new vessel he continued those deeds of activity and daring which made his name one of terror along the whole French coast. This continued until 1814, when the dethronement of Napoleon and peace with France removed the *Euryalus* and its commander to the American station. The resources of Britain being set free, her war with America was prosecuted with renewed vigour, and Napier, although in a subordinate command, distinguished himself in a hazardous expedition up the Potomac, and in the operations against Baltimore. The peace with America occasioned the recall of the *Euryalus* to England, where it was paid off, while the services of Napier were recognized with a companionship of the Bath. Years of peace followed, during which he had no prospect of active service, and was placed upon half-pay; but in the same year that he returned home he endeavoured to settle himself into the quiet of domestic life by marrying Eliza, the widow of Lieutenant Elers, R.N., and only daughter of Lieutenant Young-husband, R.N., to whom he had been attached from early boyhood. By her former marriage she had four young children, whom he treated with paternal care and affection, and on being married he fixed his residence in a pleasant country-residence in South Hants. But this sort of life was too peaceful for his restless temperament, and on the occupation of France by the allies he started off with Mrs. Napier on what was intended to be a short visit to Paris, but which ultimately became a tour over the greater part of the Continent. In such a flying land expedition it was not wonderful that the eccentricities of "Mad Charlie" should occasionally break out. On arriving at Pisa, and wishing to procure lodgings, two facchini offered themselves for the purpose; but Napier, thinking that one was enough, selected his

man, by whom alone the commission was to be executed, and to whom a stipulated sum was to be paid. When the residence was found, and the luggage housed, Napier proceeded to pay his facchino, but his companion, a strong powerful fellow, burst into the room, and insisted on being paid also. On a flat refusal being given, the two facchini made common cause, and thought to bully the stranger into compliance; but on their advancing against him, Napier felled the foremost with a log of wood which he snatched from the fire-place, and put the other to flight. A mob soon assembled in the street with such clamours and threats that Napier saw it necessary to appeal to the Tribunal of Justice, and having inquired where the building was, he set out for the place, leading his young step-son in his hand. His appearance in the street made the mob more clamorous; and they pressed after him as if only waiting for an apology to tear him to pieces, or throw him into the river Arno, across the bridge of which he had to walk. Napier kept a calm countenance, and walked on with a deliberate step until he had neared the building he was in quest of, when he said to the boy, "Now, hold by me, and run for your life!" Off the pair started at their utmost, with the mob in full pursuit, but Napier's lame leg and his step-son's short legs were no match for the pursuers, who soon gained upon them, and would have overtaken them had the race continued a little further. But the captain had so calculated his distance that he reached the Tribunal in the nick of time; and, finding a sentry standing at the door under the portico, he wrenched the musket from his hands, wheeled about, and advanced against the mob at the bayonet charge, who were so confounded that they pulled up, and gazed in stupid terror. This ridiculous affair detained him several months at Pisa, for the facchino's head and arm were broken, and an action of assault and battery with heavy damages was entered against him, the result of which he was obliged to await. But at the trial he was acquitted, and a handsome present which he bestowed upon the wounded man satisfied all parties alike.

Napier, however, turned his tour to better account than the breaking of impertinent heads and paying visits to picture-galleries. He studied the harbours and shipping of every maritime station, and the forts by which they were defended, with such an observant eye that nothing escaped his notice; and the profitable account to which these studies were turned was shown by his work on the *State of the Navy*, which was published in 1851. He finally settled in Paris, where he remained several years, and here he directed his attention to steam navigation, and established the first steamers on the Seine. But finding that wooden steamers did not suit that river, owing to their large draught of water, his love of surmounting difficulties induced him to try iron steamers, by which, although he solved the problem, he spent nearly all his fortune in the solution. He even started from the Thames in 1821 in one of these iron vessels, which, after crossing the Channel, sailed up the Seine to Paris—a feat which was then regarded as a miracle in sea navigation by a vessel which was thought only fit for rivers. "On his arrival at Paris," we are told by his biographer, "thousands flocked to see this eighth wonder of the world in the 'bateau à vapeur en fer,' though it puzzled many of the spectators to conceive how such a material could possibly be made to float; and a greater number were more incredulous, and declared it was an imposture, as such a thing could never be!"

In 1826 Captain Napier returned to England, and after repeated applications for employment was

appointed early in 1829 to the command of the *Galatea*, a 42-gun frigate. Two trips to the West Indies followed, and on the return of the *Galatea* from her second trip in 1831 he found that a great experiment, in which he was deeply interested, was already contemplated by our government: it was the application of the motive power of steam to ships of war. Napier entered with his whole heart into the idea, and hoped that he would be appointed to the first man-of-war steamer that could be got ready. But a different destination awaited him, for he was sent to the coast of Portugal and to the Azores, in which latter place he became acquainted with the Duke of Terceira and other leaders of the constitutional party; and this circumstance ultimately led to his obtaining the command of the Portuguese constitutional fleet, and the renown which he won at St. Vincent.

The constitutionalists or Pedroites were at this time so weak that they were blocked up in Oporto, and their cause would have been hopeless but for the sympathy of the British government. In this feeling Napier heartily participated, and it is supposed that from this cause he was commissioned to cruise upon the coast of Portugal and the Azores. He had expressed to the Pedroites the impolicy of their proceedings in allowing themselves to be shut up and blockaded in Oporto, and suggested the better plan of making a bold dash upon Lisbon, and thus bringing the question to a speedy issue. They caught his own ardour with the advice he tendered, and were willing to adopt it if he should be leader of the enterprise. Thus matters stood in 1832, when the Marquis Palmella arrived in London, to urge the cause of the young queen, Donna Maria, upon the British government; and finally, an offer was made to Napier of the command of the constitutional fleet. It was a tempting proposal, by which his attachment to popular government, his ambition for an independent command, and his love of daring enterprise and adventure, would all be equally gratified. The only bar to his acceptance of the offer was, that it would displace his old friend Sartorius, who was at present admiral of the Pedroite fleet; but Sartorius was already sick of the charge, and willing to resign it. The sole difficulty being thus removed, Napier closed with the offer of the Pedroites, and became commander of their navy. The very accession of his name to the cause was a tower of strength, as was manifested by the fact, that no sooner was his appointment made known than a considerable sum of money was contributed in London for the expedition. All his preparations being completed, he repaired to the scene of his new command accompanied by 137 seamen and four British officers; and as the expedition was contrary to the foreign enlistment act, all the four officers were obliged to assume new names for the occasion, while Napier chose for himself that of Carlos de Ponza. His fleet of five steamers also carried two battalions of soldiers, the one English and the other Belgian, who were to reinforce the Pedroite garrison at Oporto.

On arriving in Portugal, nothing could appear more hopeless than the cause which he had undertaken to restore. The land forces were shut up in Oporto, and closely blockaded by the Miguelites; while the fleet was only half manned by sailors, ill-clothed, ill-fed, and wholly disappointed. But such was the inspiring influence of their new commander, that they set sail to encounter an enemy of more than twice their force. Knowing that with only 176 guns they could not cope with a fleet that had 372, each man trusted to his sword as the weapon with which the battle was to be fought and won. In this condition

the two hostile fleets met off Cape St. Vincent on the 5th of July, 1833. Napier had only two frigates, two steamers, and four other small vessels, while his opponents had two line-of-battle ships, two frigates, three corvettes, two brigs, and a xebec. The Miguelites commenced the battle with a tremendous cannonade that seemed enough to annihilate their opponents; but the latter, lying down in their quarters, suffered little damage except in their rigging. At length the fleets closed, and in the manoeuvres of his ships Napier brought all that skill into play which he had learned in his former naval engagements. The result was the triumph of genius and experience over mere brute force and numbers, and the victory of Napier was so complete, that the enemy's two sail of the line and two frigates were captured; only the three corvettes and two brigs escaped, as he had no one to go after them, his two steamers having behaved like cowards, and done nothing. No naval action, it is asserted, was ever fought with such a disparity of force in vessels, armament, and men; and not the least remarkable feature in this deed was that of Napier in his small frigate attacking, boarding, and carrying with the cutlass the Miguelite admiral's line-of-battle ship. The Pedroite cause was now completely in the ascendant, and the young Princess Maria assured of the throne of Portugal, while the victor was rewarded by promotion to the rank of full admiral in the Portuguese navy, and the title of Viscount Cape St. Vincent.

After performing some campaigning against the Miguelites by land, in which Napier turned his military studies to good account, and several attempts to reform the Portuguese navy, which were defeated by the inertness and corruption of the government officials, Napier, finding that his mission in that country had ended, resigned his office at the close of 1834, and returned to England. During the following year his time was chiefly spent in country pursuits and literary occupations, for the last of which, like the rest of the Napiers, he had a strong predilection. In 1836 he published his *History of the War of Succession in Portugal*, his first attempt at authorship, and this was followed by several professional papers on *Impressment* and *the Manning of the Navy*, most of which were afterwards published in his work called *the State of the Navy*. In 1837 he entered into negotiation to succeed Colonel De Lacy Evans as commander of the British Legion serving in Spain, when De Lacy wished to resume his parliamentary duties in England. It was objected that Captain Napier having been a naval not a military man, was not eligible for such a situation; but Napier met this objection by stating that he had turned his mind a good deal to land operations; that he had been several months with the Duke of Wellington's army, and been wounded in the battle of Busaco; and that he had commanded 3000 men on land in Portugal, and had taken several towns; but the negotiation came to nothing. A favourite wish of his had been a seat in parliament, that he might advocate the interests of the navy, but his attempts to obtain an election had failed. The last of these was when he stood for the burgh of Greenwich in 1837, and was defeated; but this last rebuff only made him more eager to return to his favourite profession, and stimulated his appeals to the admiralty to that effect. His application, on which such important events depended, was successful; at the close of 1838 he was appointed to the command of the *Powerful*, a remarkably fine two-decker, carrying 84 guns, of which 78 were 32-pounders, and 6 68-pounders, with a crew of 635 men, 60 boys, and 150 marines, exclusive of officers. On joining his ship

he was suddenly ordered to the Mediterranean, in consequence of the revolt of Mehemet Ali against Turkey, and the hostile proceedings of his adopted son Ibrahim Pacha in Syria. In this struggle the Porte would have succumbed under its powerful vassal, but for the support of Britain and France, and a fleet under the command of Admiral Stopford was stationed at the mouth of the Dardanelles, to check the victorious progress of Ibrahim. The arrival of Napier to join this fleet put life and activity into its proceedings. In whatever enterprise he was engaged, whether as principal or subsidiary, there could be no lack of action; and although he was nominally second in command to Sir Robert, the force of his character won for him the ascendancy in the warlike events that followed.

The course of events brought on the war sooner than was expected. Sultan Mahmoud died, his young son and successor, Medjid, was unequal to the crisis; and encouraged by his possession of Egypt, Syria, and Arabia, Mehemet demanded to be recognized as independent sovereign of these countries, threatening in the event of a refusal to march his army to Constantinople. The British portion of the combined French-and-English fleet, consisting of twelve sail of the line, proceeded from the Dardanelles to the coast of Asia Minor; and soon after Syria revolted against the Egyptians, the mountaineers of Lebanon were in arms, and Mehemet Ali had despatched an expedition to suppress them. With a small portion of the fleet Napier was detached to the coast of Syria to hinder this advance, but with instructions not to commit himself—an order which he was not likely to regard, especially under such circumstances. An Egyptian army of 40,000 or 50,000 men was stationed throughout Syria, the insurgent men of Lebanon were quelled and in treaty with their conquerors, when Napier, having under him four ships of the line, anchored in the entrance of the port of Beyrout, where he was soon after largely reinforced by British, French, and Turkish ships of war from the allied fleet. Thus strengthened for action, he landed at Djounie Bay, and prepared for land service by entrenching his little army of 5000 British sailors and marines, Turks, and mountaineers of Lebanon who had taken arms against their oppressors. Finding that the enemy respected his position too much to attack it, Napier assumed the initiative by crossing the Nahr-el-Kelb, and driving off a strongly posted body of Albanian soldiers, of whom 400 were made prisoners. His next and more important movement was his long-projected attack upon Sidon. For this his land force consisted of 750 British marines, 100 Austrians, and 500 Turks, while this city of ancient remembrances was protected by a fort and citadel, and a garrison of 2700 men. The place, however, was speedily stormed, Napier himself leading the assailants, and when he seized the citadel he mounted to the summit of one of the turrets, and raised aloft his cap on the point of his sword—a signal of success which the crews of the British ships in the bay welcomed with three cheers. The whole garrison surrendered, and on the 29th of September, 1840, he thus briefly announced in his letter home the events of this campaign:—"I have just time to say I have gained two victories—one on the 24th, when we took between 400 and 500 prisoners; and another on the 26th, when I stormed and took the town of Sidon, and made between 2000 and 3000 prisoners."

The next proceeding which Napier recommended was a simultaneous movement upon Beyrout both by sea and land, the former by Admiral Stopford, and the latter by himself. For the execution of his own

part of the plan it was decided that from his encampment of Djounie he should lead a Turkish force across the mountains, descend in the rear of Beyrout, and there either attack the town or intercept the retreat of Suleyman Pacha, its commandant, should the latter judge it prudent to retire. But instead of Suleyman it was Ibrahim himself whom he met, and that too at the head of a considerable force. Even upon this redoubtable commander, the most formidable and successful of all the Asiatic generals, Napier inflicted a most severe defeat; but for this purpose he was obliged to urge his apathetic Turks and dispirited mountaineers to the attack, not only with exhortations, but blows of his cudgel, and by pelting them with stones. This, and the example of himself and his European staff, who charged in the front rank like ordinary soldiers, and his skilful arrangements, at length secured the victory, and the terrible Ibrahim and his highly disciplined troops fled before the Turks whom hitherto they had been wont to rout with ease. Such was the half-comic but important mountain battle of Boharsel, fought on the 10th of October, and in which his conduct was so highly valued that Admiral Stopford, among many other commendations, thus wrote to him:—"I do most heartily assure you of being fully sensible of the benefits which I and the whole expedition have received from your indefatigable services; and on rejoining the *Powerful* your conscience may be perfectly satisfied of your having accomplished all that could be done." Just before the battle Napier had received a note from the admiral, dated the day previous, apprising him of the arrival of Colonel Sir Charles Smith to take the command of the forces, and ordering him to retire, but Napier rightly judged himself too far gone, and too deeply compromised with his Syrian and Turkish allies, to obey the order. At the risk of a court-martial he therefore persevered—and we have seen the fortunate result. His soldiering ashore having ended after a month's occupation, the gallant commodore returned to the sea-service.

A still more important event, and for which Napier regarded all that had been done as only preliminary, was an attack upon Acre. This stronghold of Mehemet's authority in Syria he had carefully reconnoitred, and the effectual way of attacking it he had also calculated; and in consequence of his urgent representations it was at length resolved that the attempt should be hazarded. No wonder indeed that such hesitation should have been felt; the long and successful resistance which the town had offered to Bonaparte, and the change it had produced in his wonderful career, still continued to make the name of Acre a word of dread. The allied fleet having reduced several coast towns, resolved to crown their exploits by the capture of this town, which had been fortified by European engineers until it was considered all but impregnable. The attack was made by the admiral and the combined fleet on the 4th November, 1840. In assigning the positions of the various ships, the admiral had decided that Commodore Napier in the *Powerful* should lead in the fleet, and commence the attack. Napier, however, in passing to his station, discovered a more favourable opening, which he at once proceeded to assail, and although this movement deranged the admiral's plan, it was one that made success more easy and certain. A tremendous cannonade followed, but the Egyptians having calculated that the hostile fleet would have anchored outside of a shoal, had elevated their guns too much, so that most of their shot passed over the assailing ships, or only damaged their rigging. On the other hand, from the closeness of their approach to the town, almost every shot of the allies told

heavily upon the defences of Acre. In the midst of this cannonade, the final result of which could not be doubtful, an accident decided the fall of the town; this was the explosion of the great powder magazine on shore, by which a large portion of Acre and its batteries, and 1200 of its defenders, were blown into the air, or crushed beneath the ruins. After this, all resistance was unavailing: Acre surrendered, and Syria was set free. But why had Napier disobeyed orders, and taken up a different position? This was a subject of such disagreeable altercation between the commander-in-chief and the commodore, that the latter demanded a court-martial, which was refused, and on Sir Robert Stopford expressing himself satisfied with Napier's explanations, the affair terminated. It was still thought, however, throughout the fleet, that Napier's plan was by much the better of the two, and that without it the capture of Acre would neither have been so speedily nor successfully effected. The whole affair, which lasted only a few hours, and was of such immense importance, cost the victors a loss of not more than fourteen or fifteen killed and twenty-four wounded.

After the fall of Acre, the commodore, now regarded as the hero of the exploit, was sent to assume the command of the squadron off Alexandria, employed in the blockade of that port. But on his arrival he found his commission anything but an enviable one. With his naval force he might have successfully attacked the city; but without a considerable body of troops the attack would be nothing more than a mischievous demonstration. The season also was at hand when severe gales might be expected from almost every quarter, which would drive his ships ashore or blow them out to sea. Finding that the blockade would soon be broken up, he adopted, on the spur of the moment, such an expedient as only necessity could excuse and wisdom justify: it was to open a negotiation with Mehemet Ali on his own authority, and conclude a convention with him in the name of the allied powers, regardless of all personal consequences. He instantly followed up the resolution; in the interviews which succeeded the viceroy of Egypt and the British commodore were inspired with such a mutual esteem, as simplified the whole proceedings without the formalities and delays of diplomacy; and Mehemet agreed that on being reinstated in the hereditary government of Egypt, he would recal his son Ibrahim Pacha from Syria, and restore the Ottoman fleet to Turkey. This treaty was signed and sealed; and great was the indignation of the British ambassador at Constantinople, of Sir Robert Stopford, and our home government, so that at first the convention was repudiated. But better thoughts at last prevailed; and while the treaty was confirmed by all parties, Napier was lauded as a wise, skilful, and prompt negotiator. Napier on his part offers the following justification of his proceeding, in which every judicious person will acquiesce: "Venturing on so important a measure as the convention without authority would only be justified by the result; but it is not without precedent. Sir Sydney Smith had entered into a convention with the French for the evacuation of Egypt; and Captain Foote had also, when serving under Lord Nelson, entered into one for the evacuation of Naples. Both were rejected by their superior officers. The rejection of the first led to the expedition to Egypt, which cost some millions and the loss of much life; the rejection of the last, to scenes that are better buried in oblivion."

While Napier was thus scandalizing the whole diplomatic world by the rapidity of his proceedings, and astounding European statesmen by their sagacity,

but compelling both classes at last to confess that he had done the right thing, however he had gone about it, a picture of the commodore at this time, from the journal of one of his lieutenants, gives us a pretty correct idea of the hero of such various and important achievements:—"He is by no means a great weight [for a steeple-chase]; perhaps fourteen stone, about my own weight, but stouter and broader built; stoops from a wound in his neck, walks lame from another in his leg, turns out one of his feet, and has a most slouching, slovenly gait, a large round face, with black, bushy eyebrows, a double chin, scraggy gray, uncured whiskers and thin hair; wears a superfluity of shirt-collar, and small neck-handkerchief, always bedaubed with snuff, which he takes in immense quantities; usually has his trowsers far too short, and wears the ugliest pair of shoes he can find; and altogether takes so little pride in his dress, that I believe you might substitute a green or black coat for his uniform one, without his being a bit the wiser: still he makes all of us conform to strict uniform. This is a correct portrait of him, but, mind, you are not to laugh at him, for I do think he is one of the greatest characters of the day, and many is the person that has come on board just to have a sight of such a rum old fellow. He is by no means a pleasant officer to serve under, but one must forgive much for the honour of being commanded by such a character. His high honourable principles and gentlemanly feelings are beyond dispute; yet he is snappish and irritable at times; but shines particularly at the head of his own table, which is always well found, and no want of wine. . . . He cares not a straw for any superior as long as he conceives he is doing the best for his country—and no one knows better than himself when he is right or wrong. He is a fine fellow, and I will stick up for him against all the world."

On his return home Napier was rewarded with the distinctions which his services had merited. He was created a knight-commander of the Bath, and appointed one of the queen's naval aides-de-camp; he had also the order of Maria Theresa conferred upon him by the Emperor of Austria. On arriving in England his old desire to enter parliament was awakened anew by a general election, and on this occasion, in 1841, he presented himself as candidate for Marylebone, and was successful. Still as active in peace as in war, he was employed all day in his *History of the Syrian War*, and all the evening with the affairs of the House of Commons. The latter was a new kind of warfare, in which he had everything to learn; but he dashed into it with his usual boldness and success, and his account of his first attempt, in a letter to his wife, is both amusing and characteristic. "I have made my maiden speech," he writes; "not either so good or so long as I wished, but still it was very well received. I had it all prepared in my mind, but when I got up I forgot the second part of it, and was, as you may suppose, in a funk, and I passed over to the second sentence, which threw out the best part of it; and the thread gone, I was discouraged, and left out a great part I intended to say; but still it went off very well, and I was very much cheered." But the ice was broken, the terror of the first plunge extinguished, and ever afterwards Sir Charles Napier was a fearless speaker, more especially as the subjects which he treated were those professional matters on which no member in the house was better qualified to speak. While he was thus employed as a parliamentarian in the improvement of the navy, Sir Charles, in 1846, was promoted to the rank of rear-admiral, and in the spring following was appointed commander-in-chief of the Channel Fleet. In this command he made

such cruises as the office demanded; at one time to Lisbon to overawe the malecontents of that country, at another to the coast of Ireland, and on a third and still more important occasion to the shores of Barbary. The mountainous district of this part of Northern Africa was inhabited by hordes of pirates, and as merchant vessels were often becalmed upon their shores, called the "Reef," they had been wont from time immemorial to plunder the ships so becalmed, and murder their crews, that no witnesses might testify against them. In this way many rich merchantmen had disappeared that were supposed to have perished by the ordinary calamities of the sea; and although complaints had often been made to the Emperor of Morocco of the deeds of this portion of his subjects, he had always pleaded his inability to suppress them. As these losses had of late fallen heavily upon British merchant ships, Sir Charles Napier was commissioned in the beginning of 1849 to repair to the Barbary coast, and reduce the Reef pirates to order, as well as compel the Moorish government to check their future excesses. It was not easy to act by sea against those who moved like the wind, and could nowhere be found when most wanted; and all therefore that could be done against an invisible enemy was to burn their boats, and frighten them into temporary submission. On returning from his cruise Sir Charles retired to Merchiston, and was soon joined by his cousin, Sir Charles Napier, the celebrated general, who purchased a little estate called Oaklands, in the neighbourhood. Here the two sat down but not in idleness, for both were equally restless men, both public reformers, and as prompt in the use of their pens as their swords; and while he of the land was preparing for the press his work on India, in which he assailed the impolicy of our Eastern government, he of the sea was equally bitter in his letters to the newspapers on the mismanagement of the admiralty. And seldom have two such distinguished men, each a complete original in his way, but perfectly at one in their characters and even in their oddities, possessed the luck of being such near relatives and such near neighbours. Their intercourse was daily, and their conversation, when not upon serious matters, partook of the frolicsomeness of boyhood. "Black Charles" advised his cousin to cut down his fine fir-trees, because they looked, he said, like poles for monkeys; but the other replied that as he liked the trees, he would buy monkeys for the poles. The sailor also ridiculed his cousin's new water-tank, alleging that his fish would be queer ones, to which taunt the general replied, that he would put him into the pond, where he would be the queerest fish of the collection.

This union, however, which was well nigh as close as a Siamese twinsip, was sundered in 1853, by the death of General Sir Charles Napier, and the admiral after this continued his rural and literary pursuits without the companion whose society had cheered his occupations. He had been telling home truths on the defective state of our navy which were unpalatable to government; but the approach of national danger compelled inquiry, which led to the conviction that his statements were true. On this account, when there were threats of a rupture with France in 1852, the first lord of the admiralty consulted Sir Charles upon our naval defences in the event of a French landing, and in the following year he was honoured with a good-service pension in consideration of his past deeds. In returning thanks, Sir Charles replied that if his services were wanted he was still quite ready for work both in body and mind—and in 1854 this offer, which at

another time would have been disregarded, was thankfully accepted. The Crimean war had commenced, and none was judged so fit to command the Baltic fleet at this momentous crisis as Sir Charles Napier. His appointment not only gratified the public, but even suppressed the murmurs of his enemies, and no sooner had it passed than Sir Charles made arrangements for collecting and drilling the squadron placed under his command, and bringing it as much as the short time would permit to a state of efficiency. Amidst the huzzas of the whole nation, who believed that neither Russian forts nor fleets could resist his skill and boldness, and even at the dinner given to him by the Reform Club, where the speeches of some of our leading statesmen confirmed the popular presumption, Sir Charles did not permit himself to be borne along by the general feeling. He knew well the power of the enemy which our statesmen had been so accustomed to underrate; the high condition of their fleets, and the almost impregnable character of their naval fortresses; and also the condition of our own navy, against the defects of which he had appealed until his remonstrances had been set aside as those of an alarmist. He likewise knew that steam, which as yet was an unknown power, was now for the first time to be tried in naval warfare upon a large scale. Qualifying his hopes with these misgivings, Sir Charles assumed the command of the Baltic fleet, which was ordered in a hurry to sea, ill-appointed, under-manned, unprepared, and even without pilots—and yet consisting of only four sail of the line, four block-ships, four frigates, and four steamers, to give battle to the Russian fleet of twenty-seven sail of the line, eight or ten frigates, seven corvettes and brigs, nine steamers, and about 180 gun-boats and small craft; a fleet mounting 3160 guns, and manned by 28,000 men! At Kioge Bay he was reinforced by twelve sail of the line from England, and although still far inferior to the enemy, he resolved to bring them to an engagement. But the Russian fleets, sheltered within their ports, refused to venture out; and while his challenges were in vain, Sir Charles was unprovided with the means of closing with them and compelling them to an encounter.

These provoking delays occurred even after the arrival of the French fleet, by which his force was so much raised as to give him the assurance of victory if the enemy would venture out and give battle; but true to their plan of defence, the Russians kept their ships within the protection of the fortresses, which both the British and French admirals found to be unassailable. Finding that a fleet, if it ventured an attack upon Cronstadt or Sweaborg, would be assuredly annihilated in the attempt, Sir Charles resolved to assail Bomarsund, the principal of the Åland Islands. This was accordingly done on the 16th of August, 1854, and with such success that its batteries were demolished and the place surrendered. As the advance of the stormy season in the Baltic was at hand, it was necessary to withdraw the united fleet without further action; and Napier accordingly left the Gulf of Finland in October, hoping to renew his attempts in the following spring with better means of success. But at home a resolution had been taken that such an opportunity should not be allowed. We have seen with what vain and ignorant hopes he had been sent out upon this expedition. His departure had been like the return of a conqueror, and the popular acclamations had already anticipated all manner of impossible victories. In such a state the national expectations were exchanged into indignant complaints, and these not at their own folly, but the innocent victim by whom their vain

WILLIAM OF ORANGE

hopes had been disappointed. Why had he not taken Sweaborg and Cronstadt? Why had he not battered Sebastopol, and crushed its defenders in its ruins? Nay, why had he not sailed right on to St. Petersburg, and by its capture brought the war to a glorious close? Even the leading statesmen who had cherished the popular hallucination, and endeavoured to make political capital out of it, had now arrayed themselves against Sir Charles Napier, and were ready to become his accusers. But, after all, had Sir Charles done nothing? This comparatively bloodless campaign was not unproductive of important results, which are thus summed up by his cousin, Sir William Napier:—"He caused the thirty sail composing the powerful Russian fleet to shrink like rats into their holes; he took Bomarsund, caused Hango to be blown up, interrupted the Russian commerce, and for six months kept in a state of inaction certainly 80,000 or 90,000 good troops. He restored and enlarged the knowledge of the Gulf of Finland to navigation; ascertained what large vessels can do there, and what they cannot do; when they can act alone, when with troops, and when gun-boats can be used with effect. He carried out an ill-manned undisciplined fleet; he brought back unharmed a well-organized, well-disciplined one, with crews exercised in gunnery and seamanship—in fine, a fleet now really what it was falsely called when it started—that is to say, one of the most irresistible that ever floated on the ocean for all legitimate purposes of naval warfare." Of the prudence with which Sir Charles saved his fleet from inevitable destruction, in spite of the popular urgency and the condemnation with which he would be visited, a single testimony which we now adduce is sufficient to outweigh a whole nation of clamour and complaint. It is that of the Earl of Dundonald—of our own gallant sea-king Lord Cochrane—than whom no man ever lived who combined such chivalrous daring with so much prudent skilful calculation, and who therefore was not only the boldest but the most successful of all our British admirals. Writing to Sir Charles Napier on his return to England, the brave old earl thus alludes to the Baltic campaign of 1854:—"Those who are acquainted with the difficulties you have had to surmount, and the nature of the obstacles assigned you to encounter, can appreciate the perseverance and moral courage requisite to overcome the one and endure the other. My anxiety lest your zeal should induce you to yield your judgment to the notions of the uninitiated is now quite relieved, and the noble fleet you command is safe from the consequences of red-hot shot and incendiary missiles propelled from granite fortresses situated out of point-blank range of combustible ships. Believe me that I sympathize with you, but do not envy the exalted position in which you have been placed, knowing that my remaining energies are incapable of effecting objects which you *have* already accomplished."

On returning home Sir Charles Napier was unceremoniously dismissed by the admiralty from the command of the Baltic fleet, and Admiral Dundas appointed in his room. But although the new admiral succeeded to the command of a fleet now raised by Napier's exertions to a high state of efficiency, and supplied moreover with a large flotilla of gun-boats which his predecessor had applied for in vain, he did not take Sweaborg, attack Cronstadt, or accomplish anything memorable. Soon after his return the Aberdeen ministry retired, and their successors offered to Sir Charles the grand cross of the Bath, which he refused, and demanded an inquiry into his conduct. At length in November, 1855, on being returned M.P. for Southwark, he brought the ac-

count of his proceedings before the House of Commons, and so complete was his justification, that even his political opponents acknowledged he had been unjustly used, and attributed the whole blame of his failure to the admiralty. Thus satisfactorily justified at last, he turned his attention to his favourite subject—the improvement of the navy; and although he did not accomplish in parliament all that he sought, he effected much in behalf of our British seamen, in which punctuality in their payment, and the means of promoting the comforts of their wives and families, were not of least account. Speaking of his exertions in behalf of our seamen, a naval officer thus writes: "He was always fighting the admiralty, and they were too strong for him; yet he was always working them up to something, and it was his agitation that was the means of getting all the good that has been done for the last twenty years. He certainly might be justly styled the sailor's friend, the sailor's advocate, and the sailor's defender, for he was always at his post when there was any move on the board about them, and always looking out sharply after their interest."

On the 6th of March, 1858, Sir Charles in the course of seniority was promoted from the rank of vice-admiral of the Red to admiral of the Blue. Onward until 1860 he continued his labours in parliament, and although he had now reached the age of seventy-four years, he was still so ready for action, that he offered to contribute his aid in upsetting Bomba, the King of Naples, as he had formerly done in dethroning Don Miguel of Portugal. He therefore proposed to Garibaldi, if he could obtain the command of the Neapolitan fleet, to appear off the coast of Naples, with which he was well acquainted, and secure the capital by a short and sudden blow. But Napier's last fight had been already fought, and the iron constitution, which seemed only to grow stronger amidst storms, and wounds, and perilous victories, at length yielded to insult and ingratitude. A change in his health had occurred before his return from the Baltic, and the labour of vindicating his character from the misrepresentations of his enemies had broken a constitution which otherwise old age alone would have exhausted. He sickened on the 28th of October, and died at Merchiston Hall, Horndean, Hants, on the 6th of November, 1860, only seven days after the decease of the illustrious Cochrane, Earl of Dundonald. Thus a single week sufficed to deprive us of the two greatest heroes of the British navy.

The literary works of Sir Charles Napier, besides numerous contributions to the newspapers and the *United Service Magazine*, consisted of his histories of the war in Portugal and the war in Syria. It was a curious distinction of the "fighting Napiers," that they wrote almost as ardently and ably as they fought. Sir Charles was no exception to the general rule; and although he was too straightforward and impatient to study the graces of composition, he showed that he had the power to become an eloquent writer. Independently of his British titles of honour, he was a knight of Maria Theresa of Austria, knight of St. George of Russia, knight of the Red Eagle of Prussia, grand cross of the Tower and Sword of Portugal, a grandee of the first class, and Count Cape St. Vincent in the peerage of that kingdom.

NAPIER, JOHN, of Merchiston, near Edinburgh, the celebrated inventor of the logarithms, was born in the year 1550. He was descended from an ancient race of land proprietors in Stirlingshire and Dumbartonshire. His father, Sir Alexander Napier of Edinbellie, in the former county, and Merchiston,

in the county of Edinburgh, was master of the mint to James VI., and was only sixteen years of age when the subject of this memoir was born. The mother of the inventor of the logarithms was Janet, only daughter of Sir Francis Bothwell, a lord of session, and sister of Adam, Bishop of Orkney. There is a prevalent notion that the inventor of the logarithms was a nobleman: this has arisen from his styling himself in one of his title-pages *Baro Merchistonii*; in reality, this implied *baron* in the sense of a superior of a barony, or what in England would be called lord of a manor. Napier was simply *laird* of Merchiston—a class who in Scotland sat in parliament under the denomination of the *lesser barons*.

Napier was educated at St. Salvator's College in the university of St. Andrews, which he entered in 1562. He afterwards travelled on the Continent, probably to improve himself by intercourse with learned and scientific men. Nothing further is ascertained respecting him till after he had reached the fortieth year of his age. He is then found settled at the family seats of Merchiston near Edinburgh, and Gartness in Stirlingshire, where he seems to have practised the life of a recluse student, without the least desire to mingle actively in political affairs. That his mind was alive, however, to the civil and religious interests of his country is proved by his publishing in 1593 an exposition of the Revelations, in the dedication of which to the king he urged his majesty, in very plain language, to attend better than he did to the enforcement of the laws and the protection of religion, beginning reformation in his own "house, family, and court." From this it appears that Napier belonged to the strict order of Presbyterians in Scotland; for such are exactly the sentiments chiefly found prevalent among that class of men at this period of our history.

In the scantiness of authenticated materials for the biography of Napier, some traditinary traits become interesting. It is said that, in his more secluded residence at Gartness, he had both a waterfall and a mill in his immediate neighbourhood, which considerably interrupted his studies. He was, however, a great deal more tolerant of the waterfall than of the mill; for while the one produced an incessant and equable sound, the other was attended with an irregular *clack-clack*, which marred the processes of his mind, and sometimes even rendered it necessary for him, when engaged in an unusually abstruse calculation, to desire the miller to stop work. He often walked abroad in the evening in a long mantle, and attended by a large dog; and these circumstances working upon minds totally unable to appreciate the real nature of his researches, raised a popular rumour of his being addicted to the black art. It is certain that, no more than other great men of his age, was he exempt from a belief in several sciences now fully proved to have been full of imposture. The practice of forming theories only from facts, however reasonable and unavoidable it may appear, was enforced only for the first time by a contemporary of Napier—the celebrated Bacon; and, as yet, the bounds between true and false knowledge were hardly known. Napier therefore practised an art which seems nearly akin to divination, as is proved by a contract entered into in 1594 between him and Logan of Fastcastle—afterwards so celebrated for his supposed concern in the Gowrie Conspiracy. This document states it to have been agreed upon, that, as there were old reports and appearances that a sum of money was hid within Logan's house of Fastcastle, John Napier should do his utmost diligence to search and seek out, and by all craft and ingine [a phrase for mental power] to find out the same, or make it sure that no

such thing has been there. For his reward he was to have the exact third of all that was found, and to be safely guarded by Logan back to Edinburgh; and in case he should find nothing, after all trial and diligence taken, he was content to refer the satisfaction of his travels and pains to the discretion of Logan. What was the result of the attempt, or if the attempt itself was ever made, has not been ascertained.

Besides dabbling in sciences which had no foundation in nature, Napier addicted himself to certain speculations which have always been considered as just hovering between the possible and the impossible, a number of which he disclosed, in 1596, to Anthony Bacon, the brother of the more celebrated philosopher of that name. One of these schemes was for a burning mirror, similar to that of Archimedes, for setting fire to ships; another was for a mirror to produce the same effects by a material fire; a third for an engine which should send forth such quantities of shot in all directions as to clear everything in its neighbourhood; and so forth. In fact, Napier's seems to have been one of those active and excursive minds, which are sometimes found to spend a whole life in projects and speculations without producing a single article of real utility, and in other instances hit upon one or two things, perhaps, of the highest order of usefulness. As he advanced in years he seems to have gradually forsaken wild and hopeless projects, and applied himself more and more to the useful sciences. In 1596 he is found suggesting the use of salt in improving land—an idea probably passed over in his own time as chimerical, but revived in the present age with good effect. No more is heard of him till, in 1614, he astonished the world by the publication of his book of logarithms. He is understood to have devoted the intermediate time to the study of astronomy—a science then reviving to a new life under the auspices of Kepler and Galileo, the former of whom dedicated his *Ephemerides* to Napier, considering him as the greatest man of his age in the particular department to which he applied his abilities.

"The demonstrations, problems, and calculations of astronomy most commonly involve some one or more of the cases of trigonometry, or that branch of mathematics which, from certain parts, whether sides or angles, of a triangle being given, teaches how to find the others which are unknown. On this account trigonometry, both plane and spherical, engaged much of Napier's thoughts; and he spent a great deal of his time in endeavouring to contrive some methods by which the operations in both might be facilitated. Now, these operations the reader, who may be ignorant of mathematics, will observe always proceed by geometrical ratios or proportions. Thus, if certain lines be described in or about a triangle, one of these lines will bear the same geometrical proportion to another as a certain side of the triangle does to a certain other side. Of the four particulars thus arranged three must be known, and then the fourth will be found by multiplying together certain two of those known, and dividing the product by the other. This rule is derived from the very nature of geometrical proportion, but it is not necessary that we should stop to demonstrate here how it is deduced. It will be perceived, however, that it must give occasion, in solving the problems of trigonometry, to a great deal of multiplying and dividing—operations which, as everybody knows, become very tedious whenever the numbers concerned are large, and they are generally so in astronomical calculations. Hence such calculations used to exact immense time and labour, and it became most im-

portant to discover if possible a way of shortening them. Napier, as we have said, applied himself assiduously to this object; and he was probably not the only person of that age whose attention it occupied. He was, however, undoubtedly the first who succeeded in it, which he did most completely by the admirable contrivance which we are now about to explain.

"When we say that 1 bears a certain proportion, ratio, or relation to 2, we may mean any one of two things; either that one is the half of two, or that it is less than 2 by 1. If the former be what we mean, we may say that the relation in question is the same as that of 2 to 4, or of 4 to 8; if the latter, we may say that it is the same as that of 2 to 3, or of 3 to 4. Now, in the former case, we should be exemplifying what is called a *geometrical*, in the latter, what is called an *arithmetical* proportion: the former being that which regards the number of times, or parts of times, the one quantity is contained in the other; the latter regarding only the difference between the two quantities. We have already stated that the property of four quantities arranged in geometrical proportion is, that the *product* of the second and third, *divided* by the first, gives the fourth. But when four quantities are in arithmetical proportion, the *sum* of the second and third, diminished by the *subtraction* of the first, gives the fourth. Thus, in the geometrical proportion, 1 is to 2 as 2 is to 4; if 2 be multiplied by 2 it gives 4; which divided by 1 still remains 4; while, in the arithmetical proportion, 1 is to 2 as 2 is to 3; if 2 be added to 2 it gives 4; from which, if 1 be subtracted, there remains the fourth term 3. It is plain, therefore, that especially where large numbers are concerned, operations by arithmetical must be much more easily performed than operations by geometrical proportion; for, in the one case you have only to add and subtract, while in the other you have to go through the greatly more laborious processes of multiplication and division.

"Now it occurred to Napier, reflecting upon this important distinction, that a method of abbreviating the calculation of a *geometrical* proportion might perhaps be found, by substituting upon certain fixed principles, for its known terms, others in *arithmetical* proportion, and then finding, in the quantity which should result from the addition and subtraction of these last, an indication of that which should have resulted from the multiplication and division of the original figures. It had been remarked before this by more than one writer, that if the series of numbers 1, 2, 4, 8, &c., that proceed in geometrical progression, that is, by a continuation of geometrical ratios, were placed under or along side of the series 0, 1, 2, 3, &c., which are in arithmetical progression, the addition of any two terms of the latter series would give a sum, which would stand opposite to a number in the former series indicating the product of the two terms in that series, which corresponded in place to the two in the arithmetical series first taken. Thus, in the two lines,

1, 2, 4, 8, 16, 32, 64, 128, 256,
0, 1, 2, 3, 4, 5, 6, 7, 8,

the first of which consists of numbers in geometrical, and the second of numbers in arithmetical progression, if any two terms, such as 2 and 4, be taken from the latter, their sum 6, in the same line, will stand opposite to 64 in the other, which is the product of 4 multiplied by 16, the two terms of the geometrical series which stand opposite to the 2 and 4 of the arithmetical. It is also true, and follows directly from this, that if any three terms, as, for instance, 2, 4, 6, be taken in the arithmetical series,

the sum of the second and third, diminished by the subtraction of the first, which makes 8, will stand opposite to a number (256) in the geometrical series which is equal to the product of 16 and 64 (the opposites of 4 and 6), divided by 4 (the opposite of 2).

"Here, then, is to a certain extent exactly such an arrangement or table as Napier wanted. Having any geometrical proportion to calculate, the known terms of which were to be found in the first line or its continuation, he could substitute for them at once, by reference to such a table, the terms of an arithmetical proportion, which, wrought in the usual simple manner, would give him a result that would point out or indicate the unknown term of the geometrical proportion. But, unfortunately, there were many numbers which did not occur in the upper line at all, as it here appears. Thus there were not to be found in it either 3, or 5, or 6, or 7, or 9, or 10, or any other numbers, indeed, except the few that happen to result from the multiplication of any of its terms by two. Between 128 and 256, for example, there were 127 numbers wanting, and between 256 and the next term (512) there would be 255 not to be found.

"We cannot here attempt to explain the methods by which Napier's ingenuity succeeded in filling up these chasms, but must refer the reader, for full information upon this subject, to the professedly scientific works which treat of the history and construction of logarithms. Suffice it to say that he devised a mode by which he could calculate the proper number to be placed in the table over against any number whatever, whether integral or fractional. The new numerical expressions thus found he called *logarithms*, a term of Greek etymology, which signifies the ratios or proportions of numbers. He afterwards fixed upon the progression, 1, 10, 100, 1000, &c., or that which results from continued multiplication by 10, and which is the same according to which the present tables are constructed. This improvement, which possesses many advantages, had suggested itself about the same time to the learned Henry Briggs, then professor of geometry in Gresham College, one of the persons who had the merit of first appreciating the value of Napier's invention, and who certainly did more than any other to spread the knowledge of it, and also to contribute to its perfection."¹

The invention was very soon known over all Europe, and was everywhere hailed with admiration by men of science. Napier followed it up in 1617, by publishing a small treatise, giving an account of a method of performing the operations of multiplication and division by means of a number of small rods. These materials for calculation have maintained their place in science, and are known by the appellation of Napier's Bones.

In 1608 Napier succeeded his father, when he had a contest with his brothers and sisters on account of some settlements made to his prejudice by his father, in breach of a promise made in 1586, in presence of some friends of the family, not to sell, wadset, or dispose, from his son John, the lands of Over Merchiston, or any part thereof. The family disputes were probably accommodated before June 9, 1613, on which day John Napier was served and returned heir of his father in the lands of Over Merchiston.

This illustrious man did not long enjoy the inheritance which had fallen to him so unusually late in life. He died, April 3, 1617, at Merchiston Castle, and was buried in the church of St. Giles, on the

¹ The above account of logarithms, which has the advantage of being very simple and intelligible, is extracted from the *Library of Entertaining Knowledge*.

eastern side of its southern entrance, where is still to be seen a stone-tablet, exposed to the street, and bearing the following inscription:—"Sep. familie Naperoru. interius hic situm est."

Napier was twice married; first, in 1571, to Elizabeth, daughter of Sir James Stirling of Keir, by whom he had a son and a daughter; secondly, to Agnes, daughter of James Chisholm of Cromlix, by whom he had ten children. His eldest son, Archibald, who succeeded him, was raised to the rank of a baron by Charles I., in 1627, under the title of Lord Napier, which is still borne by his descendants. A very elaborate life of him was published in 1835 (Blackwood, Edinburgh).

NAPIER, MACVEY. This learned lawyer, professor, and encyclopedist, was born in 1777, and was the son of John Macvey of Kirkintilloch, by a natural daughter of Napier of Craignannet. He was educated for the profession of the law, and passed as a writer to the signet in 1799. As his training had been of no ordinary kind, while his talents and attainments were of a very high order, a career of profit and reputation was anticipated for him by his friends, which, however, was not fulfilled, as he was not only of too sensitive a disposition for the practical department of his profession, but too exclusively devoted to the abstract philosophy of legislation, and the charms of general literature. These researches, however, were such as to win him distinction in the path he had chosen. His first production as an author appeared in 1818, when he published, but for private circulation, *Remarks illustrative of the Scope and Influence of the Philosophical Writings of Lord Bacon*. In 1825 he was appointed professor of conveyancing in the university of Edinburgh, having been the first who held that chair of the law faculty; and his lectures, while he officiated in this capacity, evinced the vigorous and thoughtful attention he had bestowed upon the subject. In 1837 he was finally raised to one of the clerkships of the Court of Session, an office of sufficient honour, as well as emolument, to satisfy the ambition of the most thriving legal practitioner.

The elevation of Mr. (afterwards Lord) Jeffrey to the deanship of the faculty of advocates in 1829, was the cause of bringing the literary talents of Macvey Napier into full exercise. On becoming dean of faculty the great Aristarchus of criticism was obliged to abandon the editorship of the *Edinburgh Review*, and this responsible charge was forthwith devolved upon Mr. Napier. To have been summoned to such an office, and to succeed such a man, shows the high estimate that had been formed of his talents. Afterwards a still more important claim was made upon his labours: this was to undertake the editorship of the *Encyclopedia Britannica*, of which a seventh edition was about to be published, with many additions and improvements. Such, indeed, had been the progress of art and science in the course of a few years, that not only a new edition of the work, but also a nearly new work itself, was deemed necessary, so that such an editorship was in the highest degree a most complex and laborious task. Of the manner in which this was discharged by Mr. Napier there can be but one opinion. He not only wrote able articles for the work, but secured the co-operation of the most talented writers of the day; and the result was, that the *Encyclopedia*, on being completed, took the highest place in that important class of publications to which it belongs. Years, which are now accomplishing the work of centuries, sufficed to make this edition obsolete, so that an eighth had to be produced under the editorship of Professor Trail.

Such renovations must now be the fate of colleges and encyclopedias alike: modern knowledge in its manifold changes and additions will not submit to the imprisonment of stereotype.

From the foregoing account it will be seen that the literary life of Macvey Napier was of that kind in which the individuality of the author is lost in the association of which he forms a part. In this way it would be difficult to particularize his writings, which are scattered over such extensive fields as those of the *Encyclopedia* and *Edinburgh Review*. But such is now the fate of many of the most talented of our day, whose anonymous productions melt away into the mass of journalism, and are forgot with the occasion that called them forth. Such men, however, do not live idly nor in vain, and their history is to be read in the progress of society, which continues to go onward with an always accelerating step. This was eminently the case of Macvey Napier during a life of literary exertion that continued over a course of thirty years. He died at Edinburgh on the 11th of February, 1847, in the seventieth year of his age.

NASMYTH, ALEXANDER. This excellent artist, the father of the Scottish school of landscape-painting, was born in Edinburgh, in the year 1758. Having finished his early education in his native city, he went, while still a youth, to London, where he became the apprenticed pupil of Allan Ramsay, the portrait-painter, son of the author of the *Gentle Shepherd*. Under this distinguished artist Nasmyth must have been a diligent scholar, as his subsequent excellence in portrait-painting sufficiently attested. Italy, however, was the land to which he turned his desires; and in that beautiful country, where nature and art equally unfold their rich stores for the study of the painter, he became a resident for several years. During this period he ardently devoted himself to the study of historical and portrait painting. But the attractive beauty of nature, over its wide range of varied scenery, led him at his leisure hours among the rich Italian landscapes, which he studied with the fondness of an enthusiast, and in this way, while he was daily employed in copying the best productions of the Italian schools, and endeavouring to penetrate the hidden secrets of their excellences, he was also a diligent student of natural scenery, and qualifying himself to be a landscape-painter, in which department afterwards his distinction principally consisted. To these were added the noble productions of ancient and modern architecture, that breathe the breath of life through inanimate scenes; the mouldering walls and monuments of past generations and mighty deeds, alternated with those stately palaces and picturesque dwellings that form the homes of a living generation. It was not enough for Nasmyth to delineate these attractive vistas and noble fabrics, and store them in his portfolio, as a mere stock in trade upon which to draw in future professional emergencies. He, on the contrary, so completely identified himself with their existence, that they became part and parcel of his being. This he evinced some fifty years after, when Wilkie, then fresh from Italy, visited the venerable father-artist, and conversed with him upon the objects of his recent studies. On that occasion Nasmyth astonished and delighted him by his Italian reminiscences, which were as fresh and as life-like as if he had but yesterday left the country of Raffaele and Michael Angelo.

On returning from Italy, Nasmyth commenced in earnest the practice of portrait-painting in his native city. In those days personal vanity was to the full as strong in Edinburgh as it is at present, while portrait-painters, at least artists worthy of the name,

were very scarce; and it was not wonderful, therefore, that the talents of Nasmyth in this department should soon find ample occupation. The most distinguished ladies and gentlemen of his day were proud to sit to him; and of the numerous portraits which he produced, his admirable likeness of Burns will always be considered as a valuable national monument of our honoured peasant bard. But still the artist's enthusiasm lay elsewhere: the countenance of nature possessed more charms for him than even the "human face divine," and he could not forget the delight he had experienced in sketching the beautiful and picturesque scenery of Italy. And his own native Scotland too—was it not rich in scenes that were worthy of the highest efforts of his art, although they had hitherto been overlooked? To this department he therefore turned, and soon became exclusively a landscape-painter, while his successful efforts quickly obtained for him a still higher distinction than his portraits had secured. The admiration excited by his numerous productions in this walk of art occasioned frequent visits to the mansions of the noble and wealthy, by whom he was employed. On such occasions he was sometimes led to make suggestions for the improvement of the picturesque character of the pleasure-grounds and surrounding scenery. The suggestions thus offered were so highly approved of that they not unfrequently were carried out, and Nasmyth came to be sought after as a professional adviser on the means of improving and rendering more picturesque the scenery surrounding the mansions of the great ones of the land. He therefore added this to his other occupations, and found in it an ample source of emolument, as well as professional enjoyment. Many a stately castellated and time-honoured abode of the day, which still looked as if it cared for nothing but its defences, was converted by Nasmyth's arrangements into the striking central object of an effective scene, upon which the tourist could pause with delight, instead of hurrying on as he had been wont to do. Nor was the enthusiasm of Nasmyth confined exclusively to rural beauty. He appreciated the noble site of Edinburgh, that fitting throne for the queen of cities, and was anxious that man's art should correspond with nature's beneficence in such a favoured locality. He therefore gave suggestions for the improvement of the street architecture, which have been happily followed, while many others have been partially adopted, connected with the varied scenery of the northern metropolis, by which the whole aspect of the city from its environs has been improved at almost every point. The capabilities, in an artistic point of view, of his native city, was the favourite theme of his evening conversations to the close of his long-protracted life; and many can still remember how ancient Athens itself was eclipsed by the pictures which he drew of what Edinburgh might be made, through the advantages of her position and the taste of her citizens.

To these important and engrossing occupations Nasmyth added that of a teacher of his art, by opening a school of painting in his own house, where he had for his pupils many who have since distinguished themselves as artists. Among these may be mentioned his own family of sons and daughters, all of whom were more or less imbued with his spirit, particularly his eldest son Patrick, who died before him, whose paintings now command great prices and take their place among those of our leading British painters. In this way the days of Alexander Nasmyth were spent, until first one generation of artists, and then another, had passed away; but although more than eighty years had now whitened his head and wrinkled his

brow, he still pursued his beloved occupation, as if death alone could arrest the labours of his pencil. And that all the ardour as well as skill of his former life continued unabated, was shown in his last work but one, the "Bridge of Augustus at Narni," which he sent to the exhibition of the Royal Scottish Academy in 1840. At length the hoary veteran died, and died at his post. A melancholy interest is attached to his final effort. A few days before his last illness he expressed to his daughter Jane, herself an artist of no ordinary merit, his wish to paint something, but his difficulty in finding a subject. After some deliberation and rejection, he said he would paint a little picture, which he would call "Going Home." The subject was an old labourer wending homeward when his day of labour had ended. The sombre evening sky reposes upon the neighbouring hills; on the foreground is an ancient oak, the patriarch of the forest, but now in the last stage of decay, with one of its arms drooping over a brisk stream—that stream of time which will still flow onward as merrily when the whole forest itself has passed away. The old labourer, with the slow step of age, is crossing a broken rustic bridge, and supporting himself by its slender railing, while his faithful dog, who accompanies him, seems impatient to reach home, a lonely cottage at a distance in the middle ground, where the smoke curling from the roof announces that supper is in readiness. It was the artist's own silent requiem. His last illness, which continued five weeks, was soothed by the solicitude of his family, to whom he declared that he had lived long enough, and could not die better than when surrounded by such dutiful, affectionate children. He died of natural decay, at his house, 47 York Place, Edinburgh, on the 10th of April, 1840, at the advanced age of eighty-two.

Nasmyth's landscapes are numerous, he having painted industriously throughout a long life. His scenes are naturally picturesque and well chosen. His style is simple, rarely striving after grand effects, however much his subject seems to call for such a mode of treatment. His colouring is somewhat weak, and his execution of a neat and detailed rather than a vigorous character.

Alexander Nasmyth, soon after his return from Italy, married the sister of Sir James Foulis of Woodhall, Colinton, who survived him, and by whom he had a numerous family, distinguished for talent and success in their several departments of life. Seldom, indeed, is paternal care so well rewarded, or paternal genius so perpetuated.

NASMYTH, MAJOR CHARLES. This gallant officer, one of the heroes of the Crimean war, was the eldest son of Robert Nasmyth, F.R.C.S., Edinburgh, and was born in 1826. Having been educated for the East India military service at Addiscombe College, he, after passing his examination there, was appointed director to the Bombay artillery. Having been seriously affected by the climate, he obtained the regular sick-certificate of leave of absence, and on arriving in England, in 1853, he was advised to try the effects of a change of air on the Mediterranean. In consequence of this advice he was in Turkey in 1854, at the outbreak of the Russian war, and with him was Captain Butler, also a young officer of the East India Company's service. On the investment of the Turkish town of Silistria by the Russians, this gallant pair threw themselves as volunteers into the place, and their arrival was equal to whole brigades of reinforcements. The Turkish officers, however brave, were unskilled in the use of artillery, an arm in which the Russians

excelled; and the Turks had little confidence in their leaders, so that the fall of Silistria was accounted certain; but in the two British volunteers who had come to their aid, they at once felt themselves a match for the enemy at their own weapons. Of their firm resolution to defend the town to the last they also gave an amusing indication at the commencement of the siege. A Turkish officer, who was sent over to the Russian camp, was warned of the impossibility of saving the town, and advised to surrender it on easy terms, "for," said the Russians, "we *must* take it, as the emperor has ordered us." "Well," replied the Turk, "it shall not be taken, as our sultan has ordered us to keep it."

It is not our purpose to enter into the details of the defence of Silistria, more especially as this was given in the diary of Lieutenant Nasmyth published in the *Times*. The resolution of the two belligerent parties, which they had expressed as above, was fully borne out by the deeds that followed; and as fast as the Russians advanced, whether by mine, cannonade, or hand-to-hand conflict, they were met and baffled by the indomitable obstinacy of the Turks, whose fortitude in the defence of streets and walls has become proverbial. Eight batteries were erected against the town, and each was armed with artillery of very heavy calibre. The Russians had sixty guns in position at Silistria, and threw upwards of 50,000 shot and shell, besides an incalculable quantity of small-arm ammunition. They constructed more than three miles of approaches, sprung six mines, and kept up their persevering assault during forty days. On the other hand, the Turks, confident in their two British leaders, whose directions they implicitly obeyed, handled spade or weapon as the emergency required, and either worked or fought with equal coolness under the heaviest of the fire. In every circumstance these two volunteers were the soul of the defence and the directors of all its movements. Captain Butler died, rather worn out by the fatigues he had undergone than of the wounds he had received in action; but Nasmyth, although left alone, with a double amount of toil, still animated the defenders, and taught them to hold out. And well was his perseverance rewarded at last; for after losing about 12,000 men by wounds and sickness, and alarmed at the threatened advance of the allies, the Russians hastily raised the siege.

The young artillery officer was now the object of popular applause. At a single step he had risen to the character of a skilful and successful commander, by producing such results with materials so unpromising; for he was unacquainted with even the language and manners of the people whom he had so generously come to defend, and whom his example and instructions had converted into heroes. Nor was the defence of this Turkish fortified town of inferior consequence in the war that followed. It saved the British and French armies from the necessity of conducting a campaign amidst the swamps and marshes of the Danube, which in all probability would have proved another Walcheren, and enabled them to transfer the scene of operations to the Crimea. From the East India Company's service he was transferred to the royal army, and in the Crimean campaign, through which he served, he obtained the medal with clasps for Alma, Inkermann, and Sebastopol. Being invalided from the Crimea in consequence of failing health, he returned to England, and was subsequently appointed to the Kilkenny district as an assistant adjutant-general, afterwards brigade-major at Curragh, and latterly brigade-major and deputy-assistant adjutant-general in Dublin. But his health again breaking down, he was transferred to Aus-

tralia, from which he was invalided home in 1859. It was not surprising that the fatigues he had undergone at Silistria, under which Captain Butler succumbed, should have completely undermined the constitution of Major Nasmyth. He retired to Pau, and there he continued to reside until his death, which occurred on the 2d of June, 1861. Among the honours and promotions which he so justly won, it should not be omitted that the freedom of the city of Edinburgh was conferred upon him for his services in the Turkish campaign, and particularly in the defence of Silistria.

NASMITH, DAVID. This energetic Christian philanthropist, the originator of town and city missions, was born in Glasgow, on the 21st of March, 1799. His parents were of respectable station, and eminent for piety. Like other boys of his condition, David Nasmith, after the usual course of an elementary education, was sent to the city grammar-school for the purpose of learning Latin; but after a four years' course at this academy, it was found he had profited so little, that he was found ignorant of even the rudiments of the language, and therefore unfit to enter college. And yet, during all this time, he had never been an hour absent from his classes. Judging it of no use to train him for a learned profession, his parents had him educated for business, and afterwards apprenticed him to a manufacturer. Even at these tender years, such was the religious sensitiveness of his character, that although apparently no worse than other boys, his impressions of his own worthlessness were so harassing, that more than once he was tempted to take refuge from them in suicide. But in process of time this evil spirit was cast out of him, while these experiences only tended to strengthen and confirm his faith, and prepare him for a course of correspondent action. His religious training also from earliest boyhood was such as to fit him for that especial mission to which his life was devoted, and in which he was to be so successful. From the time that he was six years old he attended a Sabbath-school; and when he had reached the age of fourteen, he and two of his school-fellows formed a society in their school, which was called the "Glasgow Youths' Bible Association," for the purpose of distributing Bibles among the poor. Of this society he was elected secretary, although, as he confesses, he neither understood the name nor the duties connected with the office. It was the commencement of a new era in his history. It brought him into contact with those youths of Glasgow who were like-minded with himself, and by whose society his religious impressions were enlarged and elevated. The circulation of the sacred volume in which he was employed made him study more earnestly its contents, that he might be better able to recommend its perusal to others. And above all, his office of secretary habituated him to the work of organizing and directing those religious societies which afterwards acknowledged him for their founder. On completing his sixteenth year he became a member of the congregation assembling in Nile Street; but although a Congregationalist or Independent, his aims as well as his disposition were of too catholic a character to be circumscribed by any sect, so that to the close of his life he regarded all Christians as his brethren.

With his growing enlargement of views, it was natural that David Nasmith should seek a field of action more immediately connected with the ministry. It was the common desire of a young enthusiast, who had not yet learned that the cause of religion can be promoted in any station of life, whether lay or clerical.

Under this impulse he resolved to be a missionary, with Africa for his sphere of occupation. Accordingly, he somewhat hastily abandoned his mercantile employment, and betook himself wholly to study, but on applying to the managers of the Theological Academy, they did not judge it fit to admit him as a pupil. Keen as was his disappointment, he meekly submitted to this rejection, and turning again to business, he was for several months unable to obtain a situation, until at last he happily succeeded. It was now also that he turned to his proper work of a home missionary. He had a Sabbath-school, where he administered religious instruction to 200 children. He took a very active share in the establishment of adult schools in Glasgow in connection with the Sabbath-evening School Youths' Union. In addition to these laborious and gratuitous services, he was secretary to the Bridewell Association for the moral and religious improvement of the male prisoners, and a visitor in the Glasgow prison to criminals under sentence of death. This was much for a youth only in his nineteenth year, and who had his daily occupation to employ him.

After having been employed in these self-imposed tasks of Christian philanthropy, which had now become the great charm of his existence, a change occurred by which David Nasmith was enabled to give himself wholly up to his beloved work. The arrival of Dr. Chalmers in Glasgow had given such a new impulse to religious benevolence and activity, that the old societies were renovated, and new ones formed, which had the diffusion of divine truth and the improvement of public morals for their object. But as their aim was one, however various their titles and modes of operation, it was deemed expedient to combine them for mutual support in their common effort, and they had accordingly procured a large and commodious edifice, which was divided into rooms and offices suitable for their respective purposes. These establishments being thus collected under one roof, a manager and overseer of the whole was found necessary, and accordingly a public advertisement was published in October, 1821, to the following effect: "Clerk wanted.—A person acquainted with books and accounts, to act as assistant-secretary to the religious societies connected with the Institution Rooms, No. 59 Glassford Street, to whom liberal encouragement will be given. None need apply but such as can satisfy the committee that their character is unexceptionable, and that they have the interest of such societies at heart." This was precisely the situation for Nasmith: it would furnish him with the means of following out his chosen lifelong occupation upon a wider scale, and with larger means of action, and he accordingly hastened to answer the advertisement. As yet he was only twenty-two years old, and might be objected to on the score of his youth and inexperience; but he stated in his application that such institutions had been "the delightful and interesting employment" of his leisure hours for the space of ten years, during three of which he had officiated as secretary to the Glasgow Youths' Bible Association—and for proof of his continued interest in it and other religious societies, he referred to several distinguished gentlemen in the city, both clerical and laic. In reference to his business habits and knowledge of books and accounts, which were also of such importance for the office, he offered to produce testimonials from his employer, the manufacturer in whose service he had been employed nearly five years. His application was successful, and the committee of the Religious Societies' Rooms elected him for their clerk. In stating this to him, however, the convener also notified that the

salary fixed for the first year was not more than sixty pounds! It was the pittance of a shop-porter for the work of a scholar, a gentleman, and a clergyman—and this too from a combination of twenty-three institutions, whose principle of action was based upon Christian liberality! But David Nasmith, with such an amount of work before him, and such scanty remuneration, was not a man to stickle upon pounds, shillings, and pence, however provident the directors might be on that head, and he closed immediately with the offer in terms of grateful acknowledgment. But the situation had benefits for him in return which money cannot buy, and which are thus stated by his biographer: "The three-and-twenty committees with and for whom he acted, were composed of ministers and laymen of all sects and of all parties, both in religion and politics. . . . To David this became not only a high sphere of religious and philanthropic action, but of moral and intellectual education. The most distinguished men in the city became his personal friends and his daily companions. Close and constant contact with such society could not fail to refine his manners, enlarge his views, and elevate his character. To his lengthened training here he mainly owed that free, and easy, and noble air which, on all occasions in after-life, so distinguished him. With scholars and gentlemen he was quite at home. His manner was nevertheless marked by singular modesty, without a particle of the embarrassments of bashfulness; and by the most perfect self-possession, without one particle of the offensiveness of arrogance. . . . To the training through which David passed during his lengthened connection with the Institution House, and the knowledge of men and things he there acquired, his success in afterwards dealing with mankind may very mainly be attributed. He thus became thoroughly conversant with associated operation; he obtained a very deep insight into the true condition of city society, and thus discovered its wants; he saw directly before him the amount and character of the agency provided for the supply of those wants; and hence he ascertained how much of those wants still remained unsupplied. Living society was in fact the great theme of his constant and intense study. Morning, noon, and night he was deeply employed in pondering the book of human nature." Nor was Nasmith indifferent to those scholastic aids by which his training might be matured and perfected. For this purpose he attended the course of lectures on logic and rhetoric delivered by Professor Jardine in the university of Glasgow, and the morning lectures of Dr. Mc'Gill, professor of theology. He also employed every moment of his leisure time in perusing the current literature of the day, and especially of such as was connected with his own avocations.

After attending to the Sabbath-schools, in the establishment, visitation, and teaching of which he showed a tact, energy, and persuasiveness that were unrivalled, David Nasmith's attention was called from the condition of children to that of young men of a better class with which every such mercantile city as Glasgow abounds—the youths especially who serve as clerks and apprentices in shops, warehouses, and public works, and who, being largely recruited from the rural districts, are at a distance from the restraints of home, and exposed to the allurements of a town life—and university students from the country, who are liable to the same temptations. To collect these and other such young men together for mutual religious instruction and improvement was now a great aim of Nasmith, and in this he succeeded so well, that in 1824 fifteen associations of the Young Men's Society for Religious Improvement were established within

less than a twelvemonth; and in 1838 (the year before he died) he had formed about seventy young men's societies in the United Kingdom, France, and America. The nature and object of these associations will be best explained in his own words:—

"These societies consist of young men between the age of fourteen and thirty-five, of good moral character, and professing no opinions subversive of evangelical principles. The members of each association meet periodically, under the superintendence of a pious and experienced president, for purposes of mutual improvement and benevolent exertion. The Bible is considered as their rule, and all political discussion is prohibited.

"Young men thus associated have had their minds and time occupied with that which was profitable, and so far they have been saved from that which was injurious, at a period the most dangerous in the life of man, when his passions are strong, when he is least disposed to submit to wholesome restraint, and most liable, through ignorance of the world, to be led astray by the subtle infidel and the embrace of her who flattereth with her lips.

"In these associations, native talent that lay hid has been brought to light, cultivated, and directed. Young men who were favourably disposed to religion, but not decided, have been won to Christ; those who in business or otherwise were necessarily associated with the infidel and licentious youth of their own age, or with masters of iniquity, have had their minds fortified, and in the hour of imminent peril have been preserved or rescued. Young men who lacked a judicious counsellor have found one in their president; others who desired suitable and profitable companions have met with them in the members of these associations. The timid have been encouraged, and the forward youth has been restrained."

Proceeding to state the beneficial public effects of these young men's societies, Mr. Nasmith thus continues:—

"These associations have united young men of various ages, grades in society, and attainments in religion and piety, and furnished opportunities to each of receiving and doing good. They have been found nurseries for the agency and committees of our Christian-visiting, tract-distributing, Bible, missionary, and benevolent societies. Missionaries now in heathen lands have gone from their ranks; home missionaries, pastors of churches, and secretaries of various Christian and philanthropic societies, can bear testimony to the advantages they have derived from their connection with young men's societies.

"Some most useful and valuable societies now existing have originated in, and been mainly promoted through, the influence of young men's societies. I have known an infant-school erected, and paid for; prisons visited; the spiritual welfare of seamen promoted; a Sabbath market stopped; Sabbath-schools established; people of colour instructed; the sick visited; the destitute relieved; temperance promoted; seventy-nine sermons preached; and 290,000 tracts and handbills distributed at two fairs, all through the united efforts and influence of young men's societies."

But all merely human institutions, however pure and elevated their aim, must be subject more or less to the corruptions of humanity, and Nasmith, while enumerating the benefits of these societies, was obliged to acknowledge their occasional shortcomings. In some instances they had failed to produce that benefit, either to their members or others, which might have been expected or that was desired, and the causes of this he has manfully and frankly

stated to be the following:—"The indisposition of men of piety, sound judgment, and experience to preside over them, and thus guide the youthful energies of their members;—the determination of young men of ardent zeal to have their own way, even to the annoyance and injury of the whole body—an attempt at a display of one's own powers rather than a determination to use them only to the edification of his associates—a love of the showy instead of the solid—the irregular attendance of the presidents, and of the more experienced members of associations—the introduction of a spirit of criticism—a want of forbearance with the young, the ignorant, or the weak members; so treating them as to lead to their discouragement and ultimate withdrawal—a departure from that *practical* reading of the Word of God which ought ever to characterize that part of the exercises of their meetings; and these," he concluded, "are *some* of the difficulties that have impeded the progress and efficiency of young men's societies." These, however, were the inevitable evils of all such Christian institutions; they annoyed David Nasmith, but they had also annoyed the apostles themselves. Even in the great work of regenerating the world it was impossible but that offences should come.

But the great enterprise of Nasmith's benevolence, to which all that had gone before was only a preparative, was the establishment of city missions, which he commenced in Glasgow in January, 1826.

At that time efforts had been made to preach the gospel to the poor in school-houses and other such places as they would attend. But these were only desultory and individual efforts, and as such they proved a failure. The myriads of poor in such a city as Glasgow could not be overtaken by the occasional labours of a few ministers, and these preaching visitations, few and far between, left little or no permanent effect upon their auditories. The benevolent men who had originated the practice acted without any established system; and the clergymen who were employed in such extra labours were in demand at so many different stations, that they withdrew, declaring they could stand it no longer. Nasmith waited personally upon eighteen ministers, and asked how many sermons they would undertake to preach in a year; but when only sixty-seven sermons were promised, he saw that this was scarcely more than sufficient to supply the requirements of a single station. The plan was then devised of setting apart one or more persons to carry religious instruction to the poor in their own dwellings; but here the sectarian spirit interposed, so that each individual was willing to contribute only on condition that the missionary belonged to his own religious denomination. Nasmith saw that churches, not individuals, were needed to sustain such a work, and accordingly he commenced with his own brethren, the Nile Street congregation. They entered heartily into the design, and without any sectarian limitations, for a plan was drawn up that embraced the whole city, and upon such a broad basis that every denomination could unite with it. Six young men of the congregation were chosen to collect the funds necessary for the support of a single missionary, with three seniors to select and superintend him; and before the day of meeting a sister congregation intimated their desire to unite with them, from whom an equal number was united to the committee. Thus the Glasgow City Mission was formed on the first day of January, 1826. Before the year had closed eight evangelical denominations were united in the board of management, and as many city missionaries were in active employment. At the end of the second year the number of missionaries had increased to thirteen, with an adequate fund chiefly

contributed by ladies. Having thus tested the experiment, and proved its efficiency, Mr. Nasmith wrote to his correspondents, and afterwards printed 2000 circulars explanatory of the design and plan of the society, with recommendations appended from Dr. Chalmers and other influential clergymen; and these were sent to the principal cities and towns of Scotland, England, Ireland, France, and other places on the Continent, also to Asia, Africa, and America.

Various circumstances now made it necessary for Nasmith to resign his charge at the Institution House. He was a married man, and the scanty salary was insufficient for the maintenance of a family. Its societies were already organized and in full working trim, and might be carried on by a less experienced agent. And above all, his health required relaxation and change. In writing of his condition, he states, "My desires were unbounded, and my mind got so constantly engrossed with the thirty machines at work in devising and attempting to execute plans for rendering them efficient, that the feeble frame could no longer endure it. To have continued in the situation and taken things more easy was impossible without injury to my mind, for I considered that a proper discharge of my duties did not admit of it without positive injury to the general cause." In 1828 he accordingly sent in his resignation of office, which was regarded by the institution as a heavy calamity, and accepted with regret. Another field of occupation must be found, but connected with missionary enterprise, which had now become to him a necessary of life; and being invited to visit a friend in Dublin, he went there the same year. Here he addressed himself with his wonted zeal to the establishment of city missions, and their auxiliary, the institution of Scripture-readers; and while thus employed he was offered the situation of assistant-secretary to the Scripture-reader Society in Dublin, to visit the poor and ignorant of the city, and read to them the Bible three hours a day, with a salary of eighty pounds per annum attached to it. This, however, he declined, and added, "I do so from a persuasion that the situation would not afford sufficient scope for the expansion of my mind, the exercise of those habits which have been formed by the experience of many years, and the satisfying of the desire for more extensive and varied usefulness which the great Head of the church has been pleased to give me." It was afterwards proposed to appoint him secretary of their city mission, with a salary of £100 a year, but this also he rejected, upon the following conscientious grounds: "1. The funds of the society may not exceed £400 the first year, and to give £100 of that to any man for merely working the machinery would be quite too large a proportion of the whole. 2. It would lead people to say that I had come to form a society that I might get a bit of bread by it. 3. My influence in society and consequent usefulness would be retarded. And 4. Many would make it an excuse for not contributing to the funds of the institution."

His temporary visit in Dublin being ended, Mr. Nasmith repaired to London, where he spent a few days, and during that short period not fewer than six situations were offered to him, one of which was the secretaryship of a city mission for London, with a salary of £200 per annum. But the condition of Ireland and its need of evangelistic agencies were so impressed upon his mind, that he accepted in preference an offer from Dublin, where only one-fifth of that amount was insured to him as secretary of its city mission society. And this was the deliberate choice of a man who was solicited by his friends to enter into business, and to whose remarkable talents,

in all its departments, no amount of success seemed impossible. On the 3d of September, 1828, he set sail for Ireland, and the spirit in which he went thither the following entry in his diary will indicate:—"Two days more and I bid adieu to Scotland, to Glasgow, to relations, to friends, to spheres of usefulness in which I have been enabled, through grace, to walk for some time, and to the dear church in Nile Street; and I go to a land of comparative darkness; not that I may be richer as to this world; not that I may be more esteemed and honoured; not that I may be idle: but I go seeking only the glory of God, and the advancement of his salvation amongst the inhabitants of that land. Whether I shall be long or usefully employed the Lord knows; I go forth leaning upon the Lord for temporal and spiritual support, believing that he will open to me a door of usefulness, that he will provide me with bread in it, and give me grace to be faithful. I desire to be extensively useful to the church with which I may be connected;—to the circle of acquaintance that may be given to me;—to children;—to young men;—to students of divinity;—to the poor;—to the inhabitants of Dublin;—to the inhabitants of Ireland at large."

On arriving in Dublin Mr. Nasmith addressed himself heart and soul to his beloved and appointed work—and Sabbath-schools, Scripture-readers, and city missionaries soon showed the impulse they had received from his arrival. In his new sphere of action he made little account of the premature decay both of mind and body which his marvellous exertions in Glasgow had superinduced, and still less of the poverty which his change to Dublin had occasioned. He was now constrained, from the expensiveness of that city and his small precarious allowance, to inhabit a house of only two rooms and a kitchen, and to keep no servant. And this he had freely and cheerfully exchanged for the £300 a year which his various resources in Glasgow had brought him. Even with these reductions he was contented and happy, and only annoyed by the impediments that were offered to his work. These impediments were partly owing to the peculiarities of his field of labour. The ascendancy of Popery in Ireland was especially hostile to Protestant city missions, and could make its hostility be felt. Dublin also was so different from Glasgow, that the former city could not supply as many missionary agents as could be drawn from a single congregation of the latter, so that they had to be brought from a distance, or imported from Great Britain. But the chief difficulty experienced by the city missions in Dublin arose from the coldness or positive dislike of the clergy themselves. They were suspicious of every religious movement, unless it originated in the church and was superintended and directed by its authority; and they were jealous of the missionaries and Scripture-readers, as intruders into those kinds of teaching which ought exclusively to belong to the ministry. They taught, but they also preached while they taught. But what else could be done so long as the church itself rejected the work, and refused to become a missionary institution? "I have known," writes Nasmith, "so much of the coldness and hostility of ministers to the advancement of the Redeemer's glory, unless the effort was made by *themselves*, or *their church*, that I have ceased asking the co-operation of any minister; besides, I conceive that, in general, the ministers have quite *too much to do*, either with the things of the world, or what are called our religious societies, and the effects are too obvious in the neglect of their flock."

After the establishment by his personal labours of

town and city missions in Ireland as well as Scotland, and having seen the prospect of their increase in England, Mr. Nasmith resolved to attempt the same experiment in America. He accordingly went to New York on the 4th of September, 1829. By the 20th of the same month he had established a city mission in New York, and soon after a town mission in Newark, in the state of New Jersey. To New York he had gone without any pecuniary stipulation whatever, although his private resources were so scanty that at first he was unable to keep a servant, so that his public labours were sometimes alternated with the office of nursing his infant child. It was the spirit of Paul the apostle and tent-maker, who would labour with his hands rather than be a burden to the church. After this hopeful beginning in New York, he commenced the work of itinerating through the principal towns of America and Canada, preaching, exhorting, and conversing wherever he came upon the great purpose of his visit, urging the establishment of city missions—and everywhere strengthening the ardent, rousing the sluggish and indifferent, animating the desponding, and leaving behind him those footprints on the religious soil of America which time will not easily efface. Often also, while thus travelling from place to place, we find him going dinnerless, to save time and the expense of innkeepers' bills. The particulars of such a lengthened tour we must omit, but the result is thus summed up by his biographer: "Our philanthropist has now reached the limit of his purpose, and we are enabled to glance over the mighty expanse of his laborious pilgrimage, and to form a general estimate of his travel and toil. He has visited forty cities and towns of America, and two of Canada. In the States he has been instrumental in forming sixteen city missions, the American Young Men's Society, and eight or ten auxiliaries to it: to which must be added several associations in behalf of coloured people, and also various benevolent associations for supplying the temporal wants of the poor. In Canada he visited Quebec, Montreal, St. Andrews, Fox Point, New Glasgow, Kingston, Buffalo, and York, forming among them in all fifteen societies. These are matters of fact; but there is another view of David's labours, far more difficult to be estimated, and in its results perhaps far more important—the moral influence he exerted on a multitude of the moving and leading minds of the Christian church. Who can calculate the sum of this influence? Who can estimate the effects which may flow from it for centuries to come?" How disinterestedly this great work was performed may be seen from David Nasmith's receipts and expenditure. In Ireland he spent £366, and received £216. In the United States he spent £271, and received £98. In Canada he spent £25, and received £16. He returned to Scotland poorer by £232 than when he left it, independently of the toil he had bestowed, which of itself might have won a fortune, while he was content the while to depend upon the chance contributions of the friends of city missions for his very economical style of living. Although he knew that the labourer is worthy of his hire, he refused to present any claim, lest the cause which he had so much at heart might be misrepresented; and the Americans, thinking from the nature of his labours that he was a gentleman of independent fortune, would not insult him with the offer of repayment.

Having completed his appointed mission in America, and feeling that his own health and that of his wife required the benefits of their native climate, Mr. and Mrs. Nasmith returned to Scotland in December, 1831, and immediately on his arrival he resumed his

wonted tasks in Glasgow and Dublin alternately. The effect of this activity was, that only five months afterward he had succeeded in forming a monthly distribution tract society, a maternal association, a young ladies' society, an Irish young men's society, and a Dublin young men's society, with the prospect of other associations of a similar description being speedily formed. His attention while in America having been directed to France, and the necessity of such societies for that country, he went there in June, 1832. On landing at Boulogne his papers were examined; and finding them filled with outlines of his proceedings, and the plans of strange associations that they had never heard of, and were unable to comprehend, the French authorities at first suspected that he was some desperate and dangerous conspirator, and were with some difficulty penetrated by an inkling of his harmless purposes. As he had letters of introduction to some of the principal French and British Protestants in Paris, he was soon enabled to break ground in that famed capital, and there a city mission was formed, and funds collected for a school for English children, and a young men's society. At Havre also, during this short visit, he formed both a city mission and a young men's society; and returning home by the way of London, he there reconnoitred the ground, with a view to his future operations, as it was there that he finally hoped to spend his days. He returned to Glasgow in the beginning of August, and only two months after he was thus enabled to write to a friend in that city:—"Since I had the pleasure of seeing you I have been in Ayrshire, at Campsie, and other places, and had the satisfaction of seeing about sixteen new societies formed. The number of new tract societies formed since my return from America is about seventeen, and these together issue almost 83,000 tracts per month, or *one million* annually." Being prevented from settling in London at present by circumstances over which he had no control, the same circumstances required that he should now take steps to support his family by his own efforts. For this purpose he rented a large house in Glasgow, which he occupied as committee-rooms, offices, reading-room, &c., for the purpose of acting as a general agent to religious or philanthropic individuals or societies who might be pleased to employ him. But although it was a generous, it was a rash, speculation: it was one that to succeed would have required capital, and of this the self-denying David Nasmith had none whatever; and when he tried to obtain for the purpose a loan from some moneyed citizens, these men buttoned up their prudential pockets, and would advance nothing on such a venture. After a trial of eighteen months the unfortunate experiment was abandoned, but at the same time one of his friends had obtained for him the situation of secretary to the Continental Society in London, to which city he repaired with his family in March, 1835. His chief work was to establish a city mission in the metropolis, and his Irish friends of Dublin had promised to contribute for him a salary of £200 per annum for three years—a modicum for the expense of living in the great metropolis with which Mr. Nasmith was more than content. Of the need of such a society for London the following extracts from one of his recommendatory testimonials will suffice to show:—"He organized the first mission in Glasgow in the year 1826, where there are now upwards of twenty missionaries engaged in the instruction of the neglected portion of the population. Similar institutions have been established extensively throughout Scotland. Mr. Nasmith then repaired to Ireland, and formed a mission in

Dublin, which now enjoys the undivided labours of twenty-nine missionaries! . . . If more than twenty in Glasgow, and if twenty-nine in Dublin, be found necessary, what shall be said of the wants of London? But it is not yet clear that these numbers suffice for these cities. Dr. Chalmers has recorded his opinion that 'forty or fifty would be required to form an adequate band of labourers' for Glasgow. A number amounting to several hundreds are imperatively demanded to carry the gospel to the whole mass of our neglected and perishing fellow-citizens."

To establish, however, a city mission in London, even upon a humble scale, was no easy task. Unless it was exclusively a church movement, or exclusively one of dissenterism, its success was deemed impossible; while the patronage of the one party would be certain to excite the antagonism of the other. But Nasmith's catholic and prudent views were alike opposed to such restricted views and a one-sided course of operation. The evil to be overcome was a general one, and therefore a general effort was needed for the purpose. But he went quietly, and therefore wisely, to work in the attempt to reconcile both parties to the enterprise; and his first proceedings were commenced with a few men from the several churches who were not too bigoted to combine in a common task. Having privately originated the society, four city missionaries were chosen, and appointed to their respective localities in the more destitute parts of London, with proper salaries for their labour. The work was thus an accomplished fact, and many who would have hesitated while it was still a theory, abandoned their objections, and came forward to support it. Soon after Sir Thomas Fowell Buxton, by becoming treasurer of the society, imparted to it a character which its worst enemies could not gainsay. Six months had not elapsed when the London city mission had ten missionaries at work; in twelve months it had forty; and in twenty-two months, sixty-three missionaries; while £4000 had been received in contributions. In consequence of this rapidly growing prosperity, the society was encouraged, after half a year of existence, to establish the *City Mission Magazine*, a monthly publication, costing only twopence, and therefore within the reach of all classes, containing an account of the society's proceedings. But while devoting his principal cares to the city mission, it did not wholly absorb David Nasmith's energies; and along with it, or soon after, he formed other societies in London, which had the elevation of the Christian character of the masses for their aim. These, however, we can only name in passing. They were, the Philanthropic Institution House, the Metropolitan Tract Society, the Young Men's Society (which afterwards was changed into the British and Foreign Young Men's Society), the Reading-room, the Adult School Society, and the London Female Mission. Such activity would be incredible did we not take his abilities and their previous training into account. "With all such matters," his biographer states, "he was thoroughly familiar; he could have formed the four societies enumerated in these letters in a single evening. He framed constitutions with more facility than some men write letters of common friendship; and with respect to personal agency, a single day to David Nasmith was equal to a whole month to the great body of mankind."

But it was from this very zeal and activity, so exceeding that of ordinary mortals, that he was now to experience mortification and defeat. Many who endeavoured to keep pace with his career were distanced and left behind. Many were indignant at his superior reputation, by which they found them-

selves eclipsed. The cry was raised that, by dividing his attention among so many aims, one and all of them must be imperfectly and inefficiently followed out. To add also to the confusion, it was alleged by the churchmen that the agents whom Nasmith employed were chiefly selected from the ranks of dissenters, and that all his proceedings were for the aggrandizement of sectarianism. It was easy to refute such objectors if they had been willing to listen to refutation; but as such was not the case, he found it expedient, for the welfare of the societies he had created, to resign his charge. This he could also the more freely do, as he had brought them into such working trim that they could now go prosperously onward under ordinary agencies. He accordingly adopted this step, to the great regret of the committee, who passed on the occasion the following resolution:—"At a meeting of the committee of the London City Mission, held March 17, 1837, Resolved, that the thanks of the managers be given to Mr. David Nasmith, the founder and gratuitous secretary of this society, for his unwearied devotion to its interests; that the managers cannot but deeply lament the occurrence of any circumstance rendering his resignation in his opinion advisable; and that it is with pain they lose the services of one who, from his great experience and unceasing assiduity, was an invaluable coadjutor in this great work."

Being now free to follow out his plans of Christian benevolence in his own way, Nasmith, immediately after his resignation, formed the society called the British and Foreign Mission, for the purpose of opening correspondence with all existing city and town missions, and planting new ones where they did not exist. In his first tour for these objects he formed a town mission and a young men's society at Cambridge, and a young men's society at Ely. Passing on to Birmingham, he there formed a town mission, a ladies' branch in aid of it, and a young men's society. West Bromwich succeeded, where he planted a town mission, a maternal society, and a young men's society. All this was but the work of two or three days. Continuing his rapid and active course, he visited Manchester, Leeds, Bradford, Halifax, Huddersfield, Wakefield, and York; and in all of these important localities he planted missions and young men's societies, and in some of them also tract societies and maternal societies. When his work in Yorkshire was ended he went to Scotland, for the purpose of forming branch societies in aid of his newly established British and Foreign Mission, and was for three months so actively employed in the principal cities of his native country, that he was enabled to establish about thirty societies. And all this he achieved with a total expenditure of not more than £21, 2s. 7½d.—a sum that might well put many travelling agencies to the blush. While he was thus traversing the land as a conqueror, it was often with an empty pocket. His own occasional details of the state of his finances, communicated only to his wife, while they are sometimes amusing, attest how completely self was swallowed up in heroic devotedness to his sacred work. Writing to her at this time from Scotland, he mentions incidentally the following particulars:—"Yesterday morning my stock was sixpence, and I owed perhaps thirty shillings for advertising, &c. Now I have paid all my debt, in Edinburgh, except one of about five shillings, and have £4, 5s. in hand. I have been bare enough repeatedly on this journey. No one has known it but my Father in heaven; and he has provided just as I required it, so that I have not known want. I have dined on three pence, and not been the worse for it, day after day in Yorkshire."

But how the while could the society in London be so inattentive to its parent and founder? The answer is contained in the following words of a letter written to one of his friends in Dublin. "The funds of the British and Foreign Mission are low, low, low; £130 wanted *now* to pay what is due, besides what they owe me; as yet I have not received *one penny* from them for my family; for they have not had it to give." After the first nine months of its existence the society was not able to give him more than the sum of three pounds!

When the year 1838 commenced, David Nasmith remarked in his diary, "I am on my journey to heaven; I am more than three-quarters past my thirty-eighth mile-stone on the road, and will soon be at thirty-ninth mile-stone." Among the aims which he contemplated for this year's accomplishment, were the formation of a universal itinerating library, a loan fund for the industrious and deserving poor, twenty city missions, thirty young men's societies, twenty tract societies, twenty maternal societies, fifty family missions, and ten female missions. He added, "Great usefulness is my aim; let it not be my idol: great holiness is my aim; let me enjoy, but not *glory* in anything but Christ." By the middle of the year he had visited two English and fourteen Welsh towns and villages, and formed three city missions, thirteen tract, thirteen young men's, four maternal, three young women's, and one little girls' associations; besides four female and nine family missions, and a society for the benefit of domestic servants. In October, after a four months' absence from London, he was able at his return to announce the establishment of seventy-three societies for the various objects of religious philanthropy. At the commencement of the following year he planned a still greater amount of work, which he specified as follows:—"Finish four months' tour; write twelve city mission letters; write twenty family mission tracts; form twenty city and town missions, twenty young men's societies, ten tract societies, five female missions, twenty family missions, five young men's societies, five maternal societies, five girls' associations, five boys' associations, five servants' and providence houses, one benevolent society, and one night-asylum—one hundred and two in all." To this huge task he went with his wonted energy, visiting in his tour some of the principal towns of England, and forming societies wherever he came—making way as usual by the precarious bounty of his kind friends, but still finding his expenditure greater than his receipts, although his wonted economy had been more rigid than ever. But at length the brave one was to droop and fall, overpowered but not conquered. Such excessive labours and severe privations combined were too much for merely human energy; but although his health was yielding, he still continued to persevere in his self-appointed task. In a state of physical weakness and depression of spirit he set out to Guildford, to form a town mission, believing that the journey and work would revive him, and had reached that place apparently much recruited, when he was suddenly seized with such intolerable pain as prostrated him, and made him writhe in agony. It was his last illness, and so sharp that it could not be otherwise than short. But even in the midst of his sufferings, his devout character and entire reliance upon his heavenly Father predominated, so that when a friend observed to him, "It is hard, amidst such troubles as this, to say 'The Lord's will be done!'" he answered with much energy, "*Not at all.*" He afterwards added, "I have only one request—that God would make me eminently holy and humble." His severe pains were only terminated by death, and

his remains were interred in Bunhill-fields Churchyard, on the 25th of December, 1839.

Thus died David Nasmith in the prime of life, for he had little more than entered his fortieth year. And yet, what an active life was his, and how much it had accomplished! With the simplicity, self-abnegation, and zeal of an apostle, he combined those talents of planning, arranging, and executing great enterprises with small means, that were not surpassed by a Wesley or a Wellington; and of his success, the institution of town and city missions alone will prove an abiding memorial. The solitary pilgrimage which he commenced has swelled into the march of an army, while nobles and prelates are following his footsteps, and emulating his example. It is a most impressive attestation that in this nineteenth century, the age of political and moral reform, when so many experiments are tried and thrown aside, David Nasmith was a great and a true reformer; and that with every year his character will be better understood, and his worth and services be more highly appreciated, until his name is enrolled among the leading spirits of our age.

NASMYTH, PATRICK, the son of Alexander Nasmith, of whom a memoir has already been given, was born in Edinburgh, 7th January, 1786. He was named after Patrick Miller of Dalswinton, one of the inventors of steam navigation. In his earliest boyhood Patrick showed that love for painting by which his family, of whom he was the eldest son, were distinguished. So wholly, indeed, were his affections devoted to this pursuit, that he made no progress in the ordinary branches of a schoolboy's education, and neither the allurements of duxship nor the compulsion of the *lawse* could suffice to make him even a tolerable scholar. The school-room itself was abandoned whenever a bright sunshine announced that nature could be seen at its best; and on these occasions the truant boy was to be found in the fields or among the hedges, pencil in hand, taking sketches of the flowers and trees. Another proof of his enthusiastic devotedness to the art is yet more remarkable. While still very young, he was engaged to accompany his father on a sketching excursion; but in his preparations for the journey on the previous evening, an accident lamed his right hand, so that he was to be laid aside as unfit for service. But his left hand was still untouched, and with this he handled his pencil so effectually that the difference in the work was not greatly perceptible. Many of these left-handed sketches are now sought after by collectors, and prized for their remarkable neatness and fidelity. As Scotland, with all its beautiful scenery, has one of the most fickle of climates, so that its landscape-sketchers are often wetted to the skin, Patrick Nasmith endeavoured to counteract these interruptions, so as to continue his labours in storm as well as sunshine, by an expedient which has since become more common among artists—a travelling tent, which he sometimes carried about with him into the country. Though it was more like a little booth for the exhibition of Punch than the atelier of an artist, having been formed by his own hands, which had no skill whatever in carpentry, he consoled himself for the jeers of his companions by the good service which it yielded him. As may be guessed, this booth was never pitched upon the mountain tops when the storm was at the wildest.

Having hitherto studied under his father, Patrick Nasmith went to London, and commenced in earnest the profession of a landscape-painter, in which he acquired such distinction that he was called the

English Hobbima, although his style was liker that of Wynant. It was from the minuteness of his touch and finish that he resembled the great Flemish painter, for he could not pretend to Hobbima's boldness and vigour. Nasmyth's pictures show rather much attention to small detail, so much so as to detract from force and breadth of effect. Still his scenes, especially his English ones, are extremely pleasing. They abound in objects of quiet beauty, such as rivers with wooded margins, meadows, and gently rising grounds, reposing tranquilly beneath an untroubled sky, and secured him a reputation as a landscape-painter superior to that of his father. His Scottish scenery is not so excellent; as its wild grandeur and massiveness were not so suited to his style and general mode of treatment. Hobbima and Ruysdael were his favourite guides; but while he endeavoured to acquire their spirit, he was far from being a copyist: on the contrary, he had a delicacy which was all his own, and gained for him the foremost place in that distinguished family which has obtained the name of the "Nasmyth School."

The success with which his excellences were rewarded was such as to animate him in his labours, and his productions were so highly prized as to be in general request among the lovers of art. The most choice collections of England contain the works of his pencil, and when any of his pictures are brought to sale they generally command great prices. He is sometimes spoken of as Peter, but his pictures are signed *Patk. Nasmyth*. But while patronage was at the height, and orders steadily flowing in upon him, he was dying before his day—not a martyr, however, to the ennobling art he loved so well, and which would have cherished him so affectionately, but to a vice which degrades the highest intellect and most refined tastes to the level of the meanest. At the early age of seventeen Patrick Nasmyth, in consequence of sleeping in a damp bed, was seized with deafness, which continued with him to the last; and being thus in a great measure shut out from the healthful excitement of conversation, he endeavoured to console himself by the stimulus of the bottle—and that, too, in the retirement of his study, where the usual checks were not likely to enter. Of course the habit grew rapidly upon him, so that he became old and feeble while still young in years. At last, being attacked by influenza, he ventured, before he had recovered, to go to Norwood, to make a sketch of a scene which he had particularly admired; but he paid dear for his enthusiasm by a return of the disease, against which his enfeebled constitution had no power to rally. Even then his dying gaze was still in quest of the grand and the beautiful; and in a thunder-storm which occurred while he was dying, he besought his sisters to raise him up in bed, that he might see its passing splendour and its effects before he had himself departed. Thus he passed away, on the 17th of August, 1831, at his lodgings in South Lambeth, at the age of forty-five years.

NEILL, GENERAL JAMES GEORGE. This gallant soldier, who won for himself a high name in the suppression of the Sepoy mutiny of 1857, was the eldest son of Colonel Neill of Burnweill and Swendridge Muir, in Ayrshire, and was born in the neighbourhood of Ayr on the 26th of May, 1810. The daring and decisive spirit by which his military career was distinguished displayed itself in early boyhood. Before he was fully five years old he had strayed from home unattended; and after an absence of several hours, his anxious father, who had gone in search of the truant, saw him coming homeward across a long dangerous embankment which confined the water of

Burnweill Loch. "Where have you been, Jamie?" cried the colonel; to which the boy coolly answered, "Well, I just thought I'd like to take a long walk, and look at all things as I went on, and see whether I could get home by myself. And I have done it!" he added triumphantly, "and now I am to have no more nursery-maids running after me: I can manage myself." "You are quite right, Jamie," replied the father; and from that moment the bold urchin was manumitted from nursery control.

Having received his education at the academy of his native town until he had reached the age of fifteen, James George was sent to the university of Glasgow, to complete it. It was intended that he should devote himself to the profession of the law, but his devotedness to active sports soon showed that he was not likely to shine as a lawyer: he was a daring rider and a good shot, and preferred the liberty of the fields to the seclusion of the study. These tendencies showed his inclination; he would be a soldier; and when the events of the Burmese war were exciting general attention in Britain, he threw his heart enthusiastically into the subject, expressed his eagerness to be in the field of action, and declared that distinction could only be won in India. It was, a modification of Napoleon's well-known declaration, "All glory arises in the East." The father of Neill, like a true soldier, sympathized in the youth's ardour, and obtained for him an Indian cadetship before he had reached the age of seventeen. In January, 1827, young Neill set sail for Madras, and on arriving there, Sir Thomas Munro, who was governor of the presidency, and had married a relative of Neill, got him appointed to the 1st European regiment. It was a corps that had won a high reputation in many a well-fought engagement; and being one of the very few European regiments in the Company's service, it was likely to find abundant employment in the first war that might break out. But at present there was profound peace in India, and Neill devoted himself to his regimental duties and the study of his profession. During the first years of his service his regiment was stationed at Masulipatam, and his diligence obtained for him promotion to the post of fort-adjutant, afterwards that of quarter-master, and subsequently he was appointed adjutant of the Madras Europeans. In this last situation, upon which so much depends, and where the talents and activity of an officer are brought into full exercise, Lieutenant Neill distinguished himself by the pains he took to improve the moral character, as well as professional efficiency, of the soldiers under his command. He regulated the sale of intoxicating liquors, so that indulgence in their use should be limited to what was necessary, and kept the men in healthy activity by adult schools, workshops, and the encouragement of athletic exercises. When years had been passed in such occupations, he, in October, 1835, married Isabella, daughter of Colonel Warde, of the 5th regiment of Bengal cavalry, and in the society of his "dearest Isy" enjoyed a domestic happiness that made amends for the monotony of his professional occupations.

In 1837, when he had now been ten years in India, the effect of the climate upon his health required the wonted relief, and he returned home on a leave of absence for three years. But in his native country he was roused by reports of those commotions in Central India which afterwards terminated in the Afghan war. Hoping to have now a chance of active employment in the field, after so many years of peace, Neill hurried back to India in 1839, long before his leave of absence had expired, and volunteered for service in Afghanistan; but instead of get-

ting what he sought, he received an appointment on the general staff as assistant adjutant-general of the Ceded Districts, an office which he held for some years. His sword being thus doomed to rest in its sheath, he betook himself to those literary occupations with which so many of our Indian officers have honourably filled up their intervals of leisure, and the result was the history of his own regiment, under the title of an *Historical Record of the Madras European Regiment*, which was published in 1843. Nor were his proper duties the while neglected, but were performed with a diligence which called forth the repeated thanks of the general in command of the Ceded Territories. But the military rather than the civil department of the service was still the object of his longing, and in this he had the prospect of being gratified by the breaking out of the second Burmese war. His regiment being ordered out for Burmah, he hurried to rejoin it, but was met on the way by the announcement that he had been appointed adjutant-general of the Madras troops under Sir Scudamore Steele. On the termination of the war he was left in charge of the Madras troops in Burmah, and was actively employed in putting down the insurrections that followed in various parts of the country, a service in which his diligence and ability were repeatedly and highly commended by the governor-general of India. But his zeal and labours were too much for the climate, which laid him prostrate; and a brain fever had nearly deprived him of life, when by the care of his friends he was so far recovered as to be embarked in a steamer bound for England, which he reached in June, 1854.

On his return to his native climate the health of Neill was rapidly recovering, when the cheering prospect of occupation tended to complete the cure. The Crimean war broke out, and among the various plans for conducting it, our government had resolved to organize and discipline an army of Turkish soldiers commanded by British officers. For such a service our officers who had been in India were reckoned to be best adapted, in consequence of the nature of their military experience among Asiatics; and amidst the appointments which took place for this Anglo-Turkish contingent, General Vivian, who had been adjutant-general of the Madras army, was selected as its commander, and Colonel Neill to be his second in command. Impatient to commence his duties, Neill was so fortunate as to be among the first who were conveyed to the Bosphorus; and on assuming the command at the camp of Bayukdere of the division assigned to him, he commenced the work of discipline in good earnest, and was soon able to report his recruits as "good and steady, very smart under arms, and painstaking to a degree." But this orderly spirit unfortunately did not prevail over all the departments of this Anglo-Turkish force. The Bashi-Buzoukhs, an irregular kind of cavalry, although brave and servicable enough in action, were, like the moss-troopers of our old Scottish armies, more intent upon spoil than the cause for which they fought, making plunder of friend and foe without distinction; and in consequence of their excesses a military commission was established, having complete authority to try and punish the offenders, with Colonel Neill for its president. In such active hands the office was not likely to remain a dead letter; and on the second day of its proceedings two notorious trespassers having been tried and convicted, were punished each with 500 stripes administered "with a stick, to the enlivening strains of a quick march played by a band of music," in accordance with the military customs of the Turkish army. The punishment was a wholesome check upon the Bashi-Bu-

zoukhs, but it was necessary to continue the inquiry, and having done this he detected and fearlessly exposed the corruptions of the whole system, and proceeded to the remedy. This stern but necessary severity was so displeasing to General Beatson, the commander of the Bashi-Buzoukhs, that he published indignant contradictions to Neill's statements, which led to a long and angry controversy, and twelve officers, among whom were one brigadier-general, three lieutenant-colonels, and three majors, retired from this branch of the service. But firm in his rectitude, and confident that these wild troopers might be converted into a gallant efficient cavalry, the colonel persevered in his unwelcome reforms until his services were justly appreciated by our government, so that Lord Stratford, the British ambassador at Constantinople, required General Beatson either to adhere to the regulations of Neill in the management of his soldiers, or resign his command into the hands of the latter. It was now the hope of Colonel Neill that he should be called into active service—that he should have an opportunity of displaying the powers he was conscious of possessing, and win those military distinctions which he reasonably regarded as his due. But here, as on former occasions, his hopes were disappointed. Sebastopol fell, the war was terminated, and there was no further need of the Anglo-Turkish contingent. "It has certainly been provoking," he wrote in one of his letters, "that we have been kept back, and thrust out of the way; however, we have the satisfaction of knowing that we have succeeded admirably in organizing this contingent. . . . I have seldom seen men who move better, and are more easily handled in the field; at ball-practice they are first-rate. During the winter, when we were several times threatened, the fellows turned out in the highest possible spirit. Whether the force will be kept up remains to be seen. The French will be averse to it, as giving us so much more influence. The sultan is anxious to have British officers to organize his army, and the report is that they will be lent to him. I of course will stay if the government and Company will allow it." But amidst these surmises for the future the contingent was disbanded, and Colonel Neill returned to England.

During his stay at home, previous to the expiration of his leave of absence, his time was chiefly spent with his wife and family, interrupted at intervals by a vexatious correspondence with the authorities connected with the affair of General Beatson and the Bashi-Buzoukhs. In the midst of these, however, he was gratified by the kindness of some of the directors of the East India Company, through whom cadetships were obtained for two of his sons. But on the 16th of February, 1857, the hour of parting came, and he set out for India, where he landed on the 29th of the following month. His regiment in the meantime had gone to the Persian Gulf, in the expedition of General Sir James Outram, and Neill was about to rejoin it, but was prevented by tidings that the war in Persia had terminated. On the return of his regiment of fusiliers he was appointed to its command, his senior officer having been obliged to go to England in bad health, and he entered upon the duties of his office with alacrity. In this, one of his cares was to keep the younger officers from acquiring a habit of excess in drinking, and to cure a young gentleman of this fault he kindly invited him to live with him in the same house. He had only been two weeks thus employed when the earthquake shock commenced under which all India reeled, and our eastern empire all but toppled down. Colonel Neill had just made arrangements for a per-

manent residence at Madras when he was instantly summoned to Bengal. The call though so sudden was most welcome, for he found that the hour and occasion had arrived in which his services would be needed and found most available.

At the very commencement of his journey to Bengal, the crater of this wide-spreading Indian volcano, Neill showed his sense of the full danger of such an emergency, and the decisive daring with which he was prepared to meet it. His Madras fusiliers were to be hurried to the scene of action, and he sent them off by the quickest means of conveyance to Benares, one detachment by a steamer, while the rest were to be conveyed by railway. Connected with this land conveyance occurred the following important incident, which is best told in his own words:—

“The terminus is on the bank of the river, almost opposite the fort, at Howrah. There is a landing-place and jetty. The train was to start at 8:30 P.M. My men were all on board flats in the river, where they were cool and comfortable, and out of the way of mischief. When a party of 100 men were intended to go by train, the flat on which they were hauled into the jetty. On the night on which the second party left, the flat was hauled in, but there was a squall, and consequent delay. The railway people on shore gave no assistance. As we neared the jetty, a jack-in-office station-master called out to me very insolently that I was late, and that the train would not wait for me a moment. He would send it off without me. A little altercation ensued. Our men were landed by their officers, and went, making the best of their way up to the carriages. The fellow was still insolent, and threatened to start the train; so I put him under charge of a sergeant’s guard, with orders not to allow him to move until I gave permission. The other officials were equally threatening and impertinent. One gentleman told me that I might command a regiment, but that I did not command them; they had authority there, and that he would start the train without my men. I then placed a guard over the engineer and stoker, got all my men safely into the train, and then released the railway people. Off went the train—only ten minutes after time. . . . I told the gentlemen that their conduct was that of traitors and rebels, and fortunate it was for them that I had not to deal with them. The matter has been brought to the notice of government. I have heard nothing more than that Lord Canning thinks I did what was right; and the railway people are now most painfully civil and polite. It is given out that there was never an instance known of the railway officials being interfered with, far less made prisoners, except once in Ireland, in the Smith O’Brien affair, by Sir E. Blakeney.”

Having thus forwarded his regiment, Colonel Neill speedily followed by horse-draw. On arriving at Benares, he found that in addition to seventy men of his own regiment who had reached it, there were 120 men of her majesty’s 10th foot, and thirty European artillerymen, with three guns. But Benares was the venerated capital and nursery of Brahminism, while the native force there consisted of the 37th Sepoy regiment, a regiment of irregular cavalry, and the Sikh regiment of Loodiana. In this state of things, and with the spirit of mutiny approaching their gates, Neill suggested the daring expedient of instantly disarming the 37th regiment, and as Brigadier Ponsonby, his superior in command at Benares, had been disabled from action by a sunstroke, the colonel arranged and conducted the enterprise himself. By the decisive rapidity of his advance the Sepoys were thrown into confusion, and when they

resisted they were met at every point, broken, and put to flight. Thus the mutiny was checked before it had reached Benares, and Colonel Neill had the satisfaction of protecting the inmates of the British residency from that massacre with which the other cantonments had been visited. Not a woman or child had been touched; and having made arrangements for their safety and the protection of the place, he directed his attention to the advancing revolt, in order to check its progress, if possible, at the outset.

The condition of the city of Allahabad was the first subject to attract his attention. It was not merely the nearest point of danger, the city being not more than eight miles in advance, upon the confluence of the Jumna and the Ganges, and reckoned the key of the lower provinces of Hindostan, but the native troops stationed there were of doubtful fidelity, and might at any moment be tempted to join the revolt. Nor were Neill’s anxious surmises without foundation. They had volunteered to march against the insurgents at Delhi, for which they had been thanked by letter from the governor-general; but only three hours after the letter was read to them on parade, they raised the war-cry of rebellion, murdered their English officers, threw open the prisons, and after carrying murder and havoc through the city, prepared to invest the fort in which the remains of the British had taken shelter. But even while all was tranquil at Allahabad, Neill had sent thither a detachment of fifty of his fusiliers, with orders to proceed by forced marches; and his apprehensions were verified by their finding the city and the bridge in the hands of the mutineers, so that they entered the fort with difficulty. Two days after, Neill forwarded another detachment on the same mission; and having provided for the safety of Benares in his absence, he followed in person with a third. On arriving at Allahabad his toils and dangers in reaching the fort were almost incredible. A march of a mile through burning river sand well nigh killed him, and he was only kept alive by having water dashed over him. He could only obtain conveyance by a boat which was stolen from the rebel side of the river, and in the short transit two of his men died in the boat from sunstroke. When he reached the beleaguered fort, he was welcomed with the silent gratitude of its trembling inmates; while the sentries at the gate exclaimed fervently, “Thank God, sir, you’ll save us yet!” He was now more dead than alive, sitting in a choultry unable to move, but with a mind as active as ever he directed every proceeding for the safety of the fort and dispersion of the mutineers. On the 12th of June, the day after his arrival, he recovered the bridge of boats, by which the arrival of other detachments from his regiment was secured, and on the 13th he swept the enemy out of the adjacent villages, where they were mustering in great strength. On the 14th he effected the removal from the fort of a corps of Sikhs who, on account of their unruly and mutinous behaviour, were more to be dreaded than the enemy who were without. By these energetic measures the safety of the fort was insured, while he who superintended them could only sit up for a few minutes at a time, and give his orders and directions while sitting in the batteries. The importance of such a rescue was thus announced in a letter from Lord Canning to the chairman of the East India Company: “At Allahabad the 6th regiment has mutinied, and fearful atrocities were committed by the people on Europeans outside the fort. But the fort has been saved. Colonel Neill, with nearly 300 European fusiliers, is established in it; and that point,

the most precious in India at this moment, and for many years the one most neglected, is safe, thank God!"

After the fort was relieved, Colonel Neill felt as if his duties had only commenced; and although still an invalid, while cholera was making frightful ravages among his troops, he resolved to attempt the relief of Sir Hugh Wheeler at Cawnpore. He accordingly sent a large detachment of his force for this service, under Major Renaud, his second in command, which was to proceed by land; but as speed was of the utmost importance, he also assigned a detachment of 100 men, who were to proceed by water up the Ganges to the same service, under Captain Spurgin. The instructions which he drew out for the guidance both of Renaud and Spurgin on this occasion are master-pieces of military arrangement, as well as characterized by his usual tactics of aiming right at the head of the evil. While thus employed, he was visited by General Havelock, who had just returned from Persia, and been appointed to relieve Lucknow. The meeting of two such men, so like in some respects and so unlike in others, was as cordial as could have been desired, and the instructions which Neill had drawn out to Major Renaud for the relief of Cawnpore met with Havelock's highest approbation. But scarcely had they been signed when tidings arrived of the butchery at Cawnpore, by which all mortal aid was rendered useless. It was such a tale of treachery and horror that Neill was disposed to treat it as a mere invention of the enemy, and urged the immediate commencement of Renaud's march. This was grudgingly allowed, and Havelock soon following, entered upon that path which led him to victory and renown. While he was in the midst of his glorious career, Neill was ordered to join him as soon as possible. "But his health is not strong," added the telegram of the commander-in-chief, "and the season is very trying; it is urgently necessary, therefore, that provision should be made for placing the command of the column in tried hands, of known and assured efficiency, in whom perfect confidence can be placed, in case Havelock should become from any cause unfit for duty. You have been selected for the post, and accordingly you will proceed with every practicable expedition to join Havelock; making over the command of Allahabad to the next senior officer." Neill set off next morning at dawn, and in five days got to Cawnpore, where he found General Havelock in the midst of his victories, and making preparations for more. These preparations he evidently did not wish in any way to be tampered with, and the pair had no sooner met than Havelock said, "Now, General Neill, let us understand each other; you have no power or authority here whilst I am here, and you are not to issue a single order." After superintending the crossing of his troops and material over the Ghaut, he left Cawnpore, and General Neill in command of it.

A stern act of justice characterized the commencement of Neill's command in this memorable place. He instituted strict inquiry into the particulars of the Cawnpore massacre, and having ascertained the particulars of this frightful iniquity and its perpetrators, he resolved that the punishment should be as signal as the crime, and on the 25th of July, 1857, he issued the following appalling order: "The well in which are the remains of the poor women and children so brutally murdered by this miscreant the Nana, will be filled up, and neatly and decently covered over to form their grave: a party of European soldiers will do so this evening, under the superintendence of an officer. The house in

which they were butchered, and which is stained with their blood, will not be washed or cleaned by their countrymen; but Brigadier-general Neill has determined that every stain of that innocent blood shall be cleared up and wiped out, previous to their execution, by such of the miscreants as may be hereafter apprehended, who took an active part in the mutiny, to be selected according to their rank, caste, and degree of guilt. Each miscreant, after sentence of death is pronounced upon him, will be taken down to the house in question, under a guard, and will be forced into cleaning up a small portion of the blood-stains; the task will be made as revolting to his feelings as possible, and the provost-marshal will use the lash in forcing any one objecting to complete his task. After properly cleaning up his portion the culprit is to be immediately hanged, and for this purpose a gallows will be erected close at hand." This sentence, so revolting to the religious feelings of the culprits, and such a dreadful reminder of their offence, was executed without abatement, and the first to undergo it was a Brahmin of the highest caste. The next was a Mahometan officer of our civil court, one of the leading men in Cawnpore. After several instances of merciless retributive justice, General Neill applied himself to keep out the mutiny from Cawnpore, and to maintain the communications of that place with Allahabad, and with General Havelock in Oude—a task for which he had only 300 soldiers, who were all that could be spared. His proceedings for that purpose were conducted with his usual sagacity and promptitude, and he was impatiently waiting for tidings of the advance of Havelock upon Lucknow, when he was paralyzed by the intelligence of that general's retrograde movement in the midst of his successful career, and an angry correspondence between them on the subject was the result. In such an extremity the utmost of daring was, in Neill's opinion, the utmost of prudence, and that to retreat, or even to stand still, was to fall. His continual cry therefore throughout the whole mutiny was "Forward!" and after events indicated that his judgment was in the right. But who, on considering the wonderful campaign of Havelock, will declare that that general was in the wrong? Both were complete commanders; both had remained comparatively unnoticed for years, until the Indian mutiny called them into notice; and both, though with different qualities, were signally adapted for the crises. Even in their death also they were not divided, for the one died in bringing relief to Lucknow, and the other after it had been relieved. The reputation of two such men cannot for a moment be impaired by a trivial disagreement.

While Havelock was thus struggling for a passage through Oude, the difficulties of Neill were multiplying at Cawnpore. About 2000 of the enemy were mustered at Bithoor, only twelve miles distant; 8000 were at Futtehgur, which was only seven miles off; 1500 at Shevrapore, twenty-four miles distant; and about the same number equally high on the opposite side of the river. And against this formidable collection of armies Neill had only his handful of 300 soldiers to encounter and keep them in check. This, however, he did successfully by a series of rapid blows, now at one party now at another; until 4000 men and five guns were about to advance from Bithoor to Cawnpore, for the purpose of cutting off its communications and attacking the town. In such a case, as what resistance he could offer would have been hopeless, he sent tidings of his case to General Havelock, who came immediately to his aid. On the 16th of August they fell upon Bithoor and routed the insurgents, after which Havelock

posted himself in Cawnpore, until the arrival of Sir Colin Campbell as commander-in-chief in India called both generals into the field for the relief of Lucknow.

After so many inevitable delays that object was to be achieved at last, and the expedition was to be commanded by Havelock, who, notwithstanding his previous quarrels with Neill, selected him for the command of the right wing of his force. It was a choice not only honourable to him who made it, but the officer on whom it fell: it showed that the one was superior to all private resentments, and that the other was judged the worthiest to hold such an office. The advance on Lucknow was commenced, and among Neill's military preparations to insure its success, his tender care for the comfort of those who were to be relieved is thus described by one of his officers: "The kind and thoughtful general, who was always thinking what he could do for others without a thought for himself, had taken great pleasure in laying in a little store of arrow-root, sago, candles, and wine, to take to the poor ladies who had been suffering for so long in Lucknow; and he took his palkee carriage to place at the disposal of some of them for their journey back to Cawnpore." The march was commenced on the 19th of September, 1857, and on the evening of the 23d the troops were in possession of the Alumbagh, in the immediate neighbourhood of the city. On the following day there was some hard fighting, but the Sepoys were defeated, and on the 25th Lucknow was to be entered by two divisions, the one commanded by Havelock and the other by Neill. After suffering by the fire from the Kaiser Bagh and the Mess House, Neill's division had entered the city, and were preparing, under a heavy fire of musketry from every house-top, to force their way to the British residency, when the general, who was a conspicuous object on horseback, was aimed at by the enemy, a bullet passed through his head, and in an instant the brave Neill was lying on the ground a corpse. In a few minutes more, had he been spared from the fatal shot, he would have entered the residency a living man and a conqueror; but as it was, his lifeless body was brought into it by his weeping soldiers, who loved him as a father. He was buried in the churchyard of the residency, and his grave was watered with the tears of all ranks, who lamented his death as a bereavement in which all equally shared.

In this manner a great soldier prematurely passed away, when the world had learned his value, and were anticipating for him a brilliant career. Much indeed he had already accomplished, but it was regarded merely as an earnest of what he was yet to achieve. Of the manner in which the loss was felt in India, the following extract from a despatch of Lord Canning, when the report had reached him only as a rumour, will convey some idea: "The governor-general in council forbears to observe further upon information which is necessarily imperfect; but he cannot refrain from expressing the deep regret with which he hears of the death of Brigadier Neill, of the 1st Madras European fusiliers, of which it is feared that no doubt exists. Brigadier-general Neill, during his short but active career in Bengal, had won the respect and confidence of the government of India; he had made himself conspicuous as an intelligent, prompt, and self-reliant soldier, ready of resource and stout of heart; and the governor-general in council offers to the government and to the army of Madras his sincere condolence upon the loss of one who was an honour to the service of their presidency." Nor was our government at home less eager to testify to his worth. For his earlier

services in the war of the Indian mutiny General Neill had already been appointed an aid-de-camp to the queen; had he survived, he would have been recommended for the dignity of knight-commander of the Bath; but as it was, his widow was commissioned by royal order to hold the title, rank, and privileges she would have held had that honour been conferred upon her husband. To these honours a liberal endowment was added by the East India Company. As was most fitting for so distinguished a man, a monument was erected to his memory in the town of Ayr, nigh to the place of his birth. The figure is of colossal size, ten feet high, and stands upon a pedestal of Dalbeattie granite twelve feet high. The incident selected by the artist was that which occurred at the railway station at Howrah. When Neill and his fusiliers were about to proceed to Benares, a portion of his regiment having not yet arrived, the train was about to be started without them, when the general immediately arrested the railway officials, and compelled them to await the expected arrival. The monument itself bears the following inscription:—

"JAMES GEORGE SMITH NEILL, C.B.,
Aid-de-camp to the Queen,
Lieutenant-colonel in the Madras Army,
Brigadier-general in India:
A brave, resolute, self-reliant soldier, universally
Acknowledged as the first who stemmed
The torrent of rebellion in Bengal.
He fell gloriously
At the relief of Lucknow,
26th Sept. 1857,
Aged 47.

NEILSON, JAMES BEAUMONT, the inventor of the hot-blast in its application to the smelting of iron, was born at Shettleston, near Glasgow, 22d June, 1792. His father, Walter Neilson, was what at that time was called an engine-wright, or at the present time an engineer, and died at a good old age, in the employment of the late William Dixon, ironmaster, as engineer at his collieries at Govan—greatly respected by all who knew him, and by his employer, who had his portrait painted and hung on the walls of his residence. Walter had two sons, John and James, who both became engineers. John, who was some years the senior of his brother, received a classical education, and was a great reader and ardent student. At his works, the Oakbank Foundry at Glasgow, in 1825, he designed, and afterwards constructed, the first iron steamer that went to sea. Latterly he became also an ironmaster, and died at a good age: his sons are proprietors of extensive ironworks in Lanarkshire. James, or Beaumont as he was usually called, at an early age assisted his father in erecting and working the steam-engines constructed for mining purposes, and was afterwards apprenticed to his brother. In 1814 he left his brother's works, like his father became engine-wright, and was employed by Mr. William Taylor at his collieries, near Irvine. In 1817 he was appointed engineer to the gas-works then just established at Glasgow, where he remained until he resigned this situation as engineer and manager in 1847. The gas-works were greatly extended under his directions, and many improvements introduced by him into gas manufacture, then practically little known. In consequence of the great eminence to which he rose as a gas-engineer, he was much consulted from all quarters. He introduced clay-retorts instead of iron, and as early as about 1826 heated his retort ovens entirely by the waste coal-tar as liquid fuel—used sulphate of iron solutions to remove the ammonia found so injurious to pipes and gas-fittings, &c. &c.; but the most beautiful and ingenious of his inventions was the

"swallow-tail" burner, since used all over the world. The first large roof constructed entirely of iron was erected by him in the early extensions of the old works at Kirk Street. Neilson patented none of these inventions, but gave them to the company, which in a great measure assisted in bringing them to the very prosperous condition they at that time enjoyed. The boy Beaumont Neilson received a very ordinary education; but in after-life he prosecuted his studies with great diligence and perseverance—had no love for society, his books being his constant companions; and so much was he impressed with the advantages to be gained by a study of the practical sciences, that in 1821 he established a workman's institution for the benefit of the men in his employment, with models, laboratory, and workshop; in fact, a little school for technical education.

Dr. Ure, in his *Dictionary of Arts and Manufactures*, says—"One of the greatest improvements made by simple means in any manufacture was accidentally observed by my pupil Mr. James Beaumont Neilson, at a smith's forge." But here the doctor is in error: the forge was constructed with a furnace under the hearth in which the air or wind was heated before being blown into the fire. This arrangement was not accidental; the experimenter was searching for some means to improve the blast employed to excite the combustion of furnaces in which iron is made, because his attention as a man of science had been drawn by an ironmaker to the fact of the irregularity of the action of these furnaces, particularly the difference between winter and summer working. It was suggested to him that the blast might be submitted to some purifying process; but Neilson thought that the object to be aimed at was to increase the action of the oxygen in the air, and free it from moisture. Many experiments were made, and the result was, that the patent for the hot-blast was taken out on 1st October, 1828, the title having been written by Lord Brougham. The invention may be simply described as the heating of the air-blast by passing it through vessels placed in ovens before it is blown into the smelting-furnace.

The patentee, who had neither the pecuniary means nor the influence necessary to introduce his invention to practice, applied for advice and assistance to his friends Charles Macintosh (the celebrated inventor of waterproof cloth), Colin Dunlop of the Clyde Iron-works, and John Wilson of the Dundee Iron-works. To the two former he gave each three-tenths of his patent, to the latter one-tenth, reserving only three-tenths for himself. Great difficulties were encountered in persuading ironmakers to use the invention, the general belief being that instead of heating the blast, it ought to be made as cold as possible, for which purpose refrigerators had been used, and even ice applied to them to cool the air to the utmost. Ultimately, however, it became universally adopted, and the great value of the invention was proved beyond question by the fact, that thirty-two shillings and sixpence per ton was saved in the manufacture of the iron, besides each furnace making twice the quantity of iron which it formerly did. Coal and ironstone from which iron was with difficulty made by the old system, was found most suitable by the new process. The patentees demanded only one shilling per ton of royalty.

Like other inventors who had gone before him, Neilson was subjected to great persecutions from those he had so much benefited. The ironmakers in Scotland from time to time attempted to destroy his patent; and at last, in 1840, a confederation was secretly formed, united under a formal deed,

in which "they bound themselves to institute, defend, carry on, and follow out to a conclusion such actions, and generally to adopt such proceedings, judicial and extrajudicial, as their advocates or survivors of them shall advise to be expedient and proper for setting aside the said letters-patent, and for resisting the enforcement of the claims founded by the said James Beaumont Neilson, &c. &c."

Now the struggle began in earnest between the patentees and the confederate ironmasters, and continued from 1839 to 1844. Twice a jury refused to deprive the patentee of his rights; twice were appeals to the House of Lords unsuccessful, two jury trials occupied sixteen days, about 140 witnesses were examined, at one and the same time twenty different actions were carried on, and the litigants spent between them on law charges alone not less than £40,000. Neilson was terribly discouraged and broken down in health. When the news arrived of the final decision of the House of Lords in his favour, he lay insensible under typhus fever not expected to recover.

Notwithstanding the small share of the patent he retained, and the losses from litigation, the inventor of the hot-blast realized a moderate fortune; and it may be estimated that his country benefited by his invention to the extent of about twelve millions per annum, besides the impetus it imparted to all those great works in which the price and abundance of iron forms an important element of their success.

Neilson retired to that seclusion he was so fond of on the island of Bute, where he lived several years on a property which belonged to the late marquis, and whose friendship he enjoyed. Married in early life to an Ayrshire lady, an orphan, Barbara Montgomerie, he had by her several sons and daughters. She did not live to share that repose which later in life her husband enjoyed, but by her great spirit and energy, she cheered and stirred him up when with utter despondency his health and courage seemed entirely to fail. In 1851 he bought an estate in Kirkcudbrightshire, where he lived much loved and respected, pleasing and instructing all from the store of knowledge he had accumulated, and taking an active interest in all that tended to the welfare of those around him. His love of education never left him. He built an institution, with library, school, &c., for the instruction of the people on his estate—was a member of the Church of Scotland, but left it with the Free Church at the disruption; a strict Presbyterian, with perhaps a little too much of the Puritan in his character; severe and exacting in all questions of truth or honour. He died 18th January, 1865, at Queenshill, now the property of his eldest son, Walter Montgomerie Neilson, the well-known engineer and locomotive-engine maker of Glasgow.

NICHOL, JOHN PRINGLE, LL.D. This learned professor and popular lecturer on science was one of those many Scotsmen who have raised themselves by their talents and persevering industry from a humble origin to high mark and position in the intellectual world. His father was a respectable trader in the town of Brechin, and there John was born on the 13th of January, 1804. He was the eldest of a family of three sons, all of whom were distinguished by a more than ordinary share of talent, activity, and enterprise. At first he received such an ordinary education as might qualify him for his father's business; but even at school he was so much distinguished by precocious ability and superiority to his class-fellows, that the situation of a provincial trader was thought unworthy of him. It was accordingly resolved that the church should be his future sphere,

and he was sent to the college of Aberdeen, where he maintained the same superiority which he had shown in the academy of Brechin. As his limited means made it necessary that he should work for his own support while he underwent the long course of study, he became a successful candidate for the mastership of the parish school of Dun, and afterwards succeeded to the same charge in the more important town of Hawick. Subsequently he became one of the teachers of the academy in Cupar-Fife, where he was also for some time editor of the only journal in that thriving town, and finally settled in Montrose as the rector of its academy. He thus while still in youth had continued a course every step in which was an ascent, and qualified himself for the honours and office of a professorship. In Montrose he was too active to confine himself to the ordinary task of rector of the academy; and while he faithfully discharged its duties, so as to secure the affection of his pupils and the confidence of their parents, he commenced that office for which he was best qualified, and on which his future fame was chiefly to rest. It was to popularize the abstruse sciences, and make them intelligible to the general mind, which had hitherto been excluded from their mysterious circle by subtle distinctions and an unintelligible nomenclature. He therefore gave public lectures frequently upon light, heat, electricity, and astronomy; and these difficult subjects he illustrated with such apt experiments and in such eloquent language that all acknowledged this work to be his proper office.

After having won such distinction in Montrose and over the whole district as few schoolmasters have achieved, Mr. Nichol, who amidst his professional and other occupations had never ceased to give a few weeks of attendance yearly at the divinity hall of St. Andrews as an irregular or partial student of theology, betook himself to his original destination, and as his prescribed course of college study had expired, he was licensed as a preacher of the gospel. But this was all, for his mind had already acquired a new bias. Even in the theological hall he had been unable to reduce his annual probationary discourses to the common standard of orthodox intelligibility; and a subject in his hands assumed such new forms, and betook itself to such unwonted flights of illustration, that the students were astonished, and even the professor bewildered. The latter, a man of ordinary and matter-of-fact intellect, once endeavoured, at the close of one of these strange disquisitions, to deliver the usual critique upon it—but when he opened his mouth it remained open, while not a sound issued from it. Mr. Nichol soon found that neither his varied scientific knowledge nor his remarkable eloquence were of a character or style to win popularity as a preacher, or secure a call to a church, and he wisely resolved to remain a preacher and expositor of religion as unfolded in the gospel of science. He returned therefore with double ardour to the study of astronomy, in which his essays and lectures could always command a willing audience.

In 1836 the professorship of astronomy in the university of Glasgow became vacant. This was a chair which had hitherto been of little account, as it had no royal endowment, while the small number of students made its fees a narrow revenue. But on the other hand it gave a high status in the literary world, and might be raised to its proper place by a distinguished occupant. These circumstances induced the college to offer, and Mr. Nichol to accept, the appointment. He was now professor of astronomy in Glasgow College, with the royal observatory of that city for his place of residence, and his appointment gave great satisfaction both to the students and

the public. But while he ably discharged the duties of the chair, he did not circumscribe himself to its limited range. On the contrary, during the months that he was free of his class-room, he was employed as the missionary of the science in the cities, towns, and villages of Scotland, where he expounded the wonders of astronomy as earnestly to the peasantry and mechanics as to the most learned and scientific auditories. With the exception of Dr. Dick, author of the *Christian Philosopher*, no one perhaps has ever done more to popularize the sciences, and bring them down to the common understanding. His pen was equally active, and his astronomical works, the chief of which were the *Architecture of the Heavens*, the *Planet Neptune*, the *Cyclopædia of the Physical Sciences*, the *Solar System*, and the *Planetary System*, are still too widely known to require further notice.

Besides being learned in the exact sciences, Professor Nichol was distinguished by his general knowledge and great conversational power, exhibiting in the latter department all the eloquence and aptitude of illustration by which his writings and lectures were distinguished. After a life of such active usefulness and distinction, he died at Glenburn House, Rothesay, on the 19th of September, 1859, aged fifty-five years. He was twice married, and by his first wife, Miss Tullis, daughter of Mr. Tullis, publisher and printer, Cupar-Fife, he had an only son, John Nichol, B.A. Oxon, who now holds the professorship of English literature in the university of Glasgow.

NICHOLSON, PETER. This skilful architect, whose long life was one of continued usefulness, and whose scientific knowledge was constantly turned to practical results, was born in the parish of Prestonkirk, East Lothian, on the 20th of July, 1765. Even before he had reached his ninth year he had unconsciously chosen his future profession, as was manifested by his drawings and models of the numerous mills in the neighbourhood of Prestonkirk. When a young school-boy, his scientific tastes so strongly predominated, that mathematics formed the chief object of his study; and his proficiency was so much beyond his years, that, having on one occasion borrowed from an elder boy Commadine's *Euclid*, translated by Cann, in which the engraved diagrams of the eighteenth proposition of the third book were wanting, he supplied the loss by constructing them from the proposition itself. His ardour in these studies was only increased by the difficulty he experienced in obtaining or borrowing works upon the subjects of his inquiry.

At the age of twelve Peter Nicholson was taken from the parish school of Prestonkirk, where he had been a pupil for three years, that he might assist in the occupation of his father, who was a stone-mason. But having no liking for this uncongenial work, Peter betook himself to that of a cabinet-maker; and having served a four years' apprenticeship to it at Linton, he repaired to Edinburgh, and afterwards to London, working in both capitals as a journeyman. In the latter city he also commenced teaching at an evening-school in Berwick Street, Soho, and his success in this new profession enabled him to abandon the making of chairs and tables for more intellectual pursuits, as was shown by his first publication, *The Carpenter's New Guide*, in 1792, the plates of which were engraved by his own hand. In this work the originality and inventiveness by which he was afterwards distinguished were shown in his new method in the construction of groins and niches. His next productions in authorship were the *Stru-*

dent's Instructor, the *Joiner's Assistant*, and the *Principles of Architecture*—the last-mentioned work, in three volumes, 8vo, having commenced its serial appearance in 1794, and been completed in 1809.

After a residence of eleven years in London, Mr. Nicholson returned to Scotland in 1800, and dwelt eight years in Glasgow, a city already rising into eminence, and which his skill as an architect greatly aided to adorn and benefit. His chief works in Glasgow were the wooden bridge formerly across the Clyde; Carlton Place, which may be termed the commencement of these handsome modern residences in which the city is now so abundant; and the large structure that terminates the second quadrangle of the university.

The next residence of Mr. Nicholson was Carlisle, where, through the recommendation of his countryman Telford—who, like himself, had commenced life as a stone-mason—he was appointed architect of the county of Cumberland, and in this situation he superintended the building of the new court-houses in the county town. While here he also obtained rewards from the Society of Arts for an improvement in hand-railing, and for the invention of an instrument called the centrolinear. After remaining two years in Carlisle, he returned in 1810 to London, and resumed the work of authorship, in which his pen was both active and prolific, as appears by the list of his works at this period. These were, the *Architectural Dictionary*, in two volumes large quarto, the publication of which extended from 1812 to 1819; *Mechanical Exercises*, and the *Builder and Workman's New Director*. Besides these practical works connected with his own profession as an architect, Mr. Nicholson turned his attention to subjects of a more purely scientific character, and was author of the *Method of Increments*, *Essays on the Combinatorial Analysis*, *Essay on Invololution and Evolution* (for which he received the thanks of the Académie des Sciences at Paris), *Analytical and Arithmetical Essays*, and the *Rudiments of Algebra*. In 1827 he commenced the publication of a work entitled the *School of Architecture and Engineering*, which he designed to complete in twelve numbers at 1s. 6d. each; but in consequence of the bankruptcy of the publishers, only five numbers appeared. This failure, combined with the pecuniary loss it occasioned him, so annoyed Mr. Nicholson, that in 1829 he removed from London to Morpeth, and afterwards, in 1832, to Newcastle-on-Tyne, where his time was chiefly spent in teaching, for which purpose he opened a school in the Arcade; and in the production of various scientific works. Here, also, his well-established reputation procured his election as president and honorary member of several societies connected with architecture, civil engineering, and the fine arts. But notwithstanding such a long life of interesting and multifarious authorship, his pecuniary profits by no means kept pace with his merits; and while he was the means of enriching others by his discoveries and instructions, he obtained little else for his own share than the reputation of a highly-talented originator. His writings, twenty-seven in number, were thus justly characterized in a petition from the inhabitants of Newcastle to his majesty in 1835, for the grant of a pension to Nicholson from the privy-purse:—"The works of Peter Nicholson, while they have contributed to the advancement of knowledge, have tended to raise the English mechanic to that pre-eminence he has attained over the other artificers of Europe; and, while they have been honoured with the proudest marks of distinction by the various learned societies of this kingdom, have yet failed to produce to their author those benefits which are

necessary for his existence; and it must ever be a source of regret that an individual who, having devoted his best energies to the advancement of science, should be left at the close of a long and laborious life, and in his seventy-third year, to struggle in penury and want." This application to the royal bounty was made after an attempt of Nicholson's grateful friends in Newcastle had failed to raise for him an annuity by a general subscription. On this occasion the sum of £320 had been subscribed, which only sufficed for present emergencies. Mr. Nicholson left Newcastle for Carlisle in October, 1841, and died there, June 18, 1844, in the seventy-ninth year of his age. He was twice married. By his first wife, who died at Morpeth in 1832, he had one son, Michael Angelo, author of the *Carpenter and Joiner's Companion*, who died in 1842; by his second marriage Mr. Nicholson had a son and daughter, who survived him.

NICOLL, REV. ALEXANDER, D.C.L., canon of Christchurch, and regius professor of Hebrew in the university of Oxford, was the youngest son of John Nicoll, at Monymusk, in Aberdeenshire, where he was born, April 3, 1793. He was carefully reared by his parent in the principles of the Scottish Episcopal church; and, while little more than four years of age, was placed at a private school conducted by a Mr. Sivewright, where he received the first rudiments of learning. Two years afterwards he was put to the parish school, taught by Mr. Duff, who grounded him in classical literature. His behaviour at school was that of a modest, assiduous student, and nothing but a reprimand ever disturbed the composure which was natural to him. At this school his attainments were such as to attract the notice of the clergymen of the presbytery in the course of their professional visitations. In 1805 he removed to the grammar-school of Aberdeen, at which city his elder brother, Mr. Lewis Nicoll, advocate, was able to take charge of his personal conduct. At the commencement of the winter session of the same year he became a candidate for a bursary at the Marischal College, and obtained one of the smallest in the gift of that institution. He therefore attended the classes of Latin and Greek during the session 1805-6, at the close of which he gained the prize of the silver pen, always bestowed on the best scholar. This honour, being as usual announced in the provincial newspapers, caused him to be noticed by various eminent individuals as a young man of peculiar promise. Before the next session he had studied mathematics at home, and pursued a course of miscellaneous reading. Besides attending the classes formerly mentioned, he entered in 1806 that of mathematics, then taught by Dr. Hamilton, the well-known expositor of the national debt; and also attended the prelections of Mr. Beattie in natural and civil history. During the ensuing vacation he directed his attention to drawing, and produced several maps sketched in a very neat manner.

Soon after the commencement of his third college session in 1807, Bishop Skinner, of Aberdeen, informed him that there was a vacancy at Balfol College, in one of the exhibitions upon Snell's foundation, which he thought might be obtained. By the advice of his elder brother he proceeded to Oxford, with a letter of recommendation from Bishop Skinner to Dr. Parsons, the master of the college, and was at once elected to the vacant exhibition. Having been put under the charge of a tutor (the Rev. Mr. Jenkyns), he commenced his studies with great eagerness, particularly in the department of Greek, where his chief

deficiency lay, and where he found himself, with only seven months' study of that language in a Scotch university, pitted against youths who had studied at the much superior schools of Oxford for three years. His native capacity and unwearied application soon placed him on a level with his companions, and a college life then began to have great charms for him. At Baliol he had the society of a little knot of Scottish students, partners with himself in the enjoyment of Snell's foundation, and among whom were several individuals afterwards distinguished in public life. For several years he prosecuted his studies with much diligence and success; and in 1811, after the usual examination, obtained the degree of Bachelor of Arts. It was not till 1813 that he directed his attention to the languages of the East, in which he was destined to become so noted a proficient. In a letter to his brother dated in December that year, he says: "For the last year I have been chiefly engaged in the study of the oriental languages, the Hebrew, Arabic, and Persic, and occasionally the modern languages. I have latterly obtained some knowledge of French, Italian, Spanish, Portuguese, and German. There is no place where there are finer opportunities for studying the oriental languages than in Oxford. The Bodleian Library, to which I have had access for the last two years, is said to be richer in that department than any other. I have lately been introduced to Dr. Winstanley, principal of Alban Hall, one of the best linguists in Oxford. I also know Dr. Macbride, who has lately been appointed principal of Magdalen Hall and lecturer in Arabic, who has already shown me great kindness." Soon after, on account of his knowledge of languages, particularly those of the East, he was appointed, without solicitation, one of the sub-librarians of the Bodleian, a situation which greatly favoured the progress of his studies.

In 1817 Mr. Nicoll received deacon's orders, and was appointed the curate of one of the churches in Oxford, where he had part of the duty to perform. This, however, did not in the least retard his studies, or his exertions in the Bodleian. On considering various circumstances in the history of this institution, he had marked out for himself a line of duty, by which he greatly benefited its interests and elevated his own reputation. He perceived that the enormous treasure of oriental manuscripts, about 30,000 in number, was in a great measure useless, from being imperfectly catalogued; and to remedy this defect he forthwith applied himself. He first drew up a catalogue of the manuscripts brought from the East by Dr. E. D. Clarke, and, by publishing it, at once established his fame as an orientalist of the first class. He then entered on the gigantic task of completing the general catalogue of the eastern manuscripts, which had been begun about a hundred years before by Uri, the celebrated Hungarian. The first fasciculus which he put forth of this work, embracing manuscripts in nearly a dozen different tongues, analyzing their contents, and estimating their merits in clear, forcible, and elegant Latin, diffused Nicoll's reputation throughout Europe, and brought him into acquaintance and correspondence with all the eminent orientalist at home and abroad. Every summer thereafter he visited the Continent in order to examine various celebrated collections; and ere he died, there was not one of any note which he had not seen. His epistolary correspondence with the eminent foreign literati was conducted chiefly in Latin, which he wrote with perfect facility; but his knowledge of the modern European languages was hardly less extraordinary than his oriental scholarship. He spoke and wrote with ease and

accuracy French, Italian, German, Danish, Swedish, and Romain. In short, it was the common saying of the Oxonian common-rooms, that Nicoll could walk to the wall of China without need of an interpreter. In the midst of all the honours that were paid to him, and though his intercourse with so many distinguished men had given ease and elegance to his manners, he never lost the original modesty and reserve of his nature. It was forcibly said of him by an eminent scholar, after conversing with him, "Sir, he is not modest—he is modesty itself."

The time at length arrived when he was to receive a reward due to his great merits and exertions. In June, 1822, on the promotion of Dr. Richard Laurence to the archbishopric of Cashel, Nicoll was, without solicitation, appointed to the vacant chair of regius professor of oriental languages; the following being the letter in which Lord Liverpool announced the appointment:—

"*Fife House, 19th June, 1822.*

"SIR,—In consequence of the promotion of Dr. Laurence to the archbishopric of Cashel, the regius professorship of Hebrew in the university of Oxford, together with the canonry of Christchurch attached to it, becomes vacant. The high reputation which you have acquired as an oriental scholar, and the value attached to your labours, have induced his majesty to approve of you as Dr. Laurence's successor; and I can entertain no doubt that this mark of royal favour conferred upon you without solicitation, will be a strong inducement to you to persevere in those studies by which you have acquired so much credit, and to use your utmost endeavours to promote the study of oriental literature in the university of Oxford.—I have the honour to be, Sir, your very obedient humble servant,

(Signed)

"LIVERPOOL."

Nicoll was thus elevated from a salary of about £200 a year, and the comparatively humble situation of a sub-librarian in the Bodleian, to the enjoyment of £2000, and two of the highest dignities in the university. He soon after took the degree of D.C.L.

For some years Dr. Nicoll performed the duties of his high station with the greatest zeal and success, producing a considerable increase in the attendance of his class, and not neglecting at the same time the important task which he had undertaken at the Bodleian. He had nearly completed the catalogue, when, on the 24th of September, 1828, having previously weakened his constitution by intense study, he was cut off by an inflammation in the windpipe, in the thirty-sixth year of his age.

Dr. Nicoll was twice married; first, to a Danish lady, who died in 1825; secondly, to Sophia, daughter of the Rev. J. Parsons, the learned editor of the *Oxford Septuagint*, and by whom a memoir of Dr. Nicoll was prefixed to a posthumous volume of his sermons. By his second wife Dr. Nicoll had three daughters, who survived him. "This great scholar," said one of the journals in alluding to his death, "has left behind him a reputation which his family may well consider as their dearest treasure. While his attainments were of the first order, his personal character was without spot or blemish. He was virtuous in every relation of life; cheerful in poverty; humble in prosperity; sincere, kind, generous, and eminently pious."

NICOLL, ROBERT. The life of a poet born and nursed in poverty is generally continued in poverty to the close: his career is a struggle of want and privation, of which the end too often is nothing but defeat and disaster. Such was the history of Robert Nicoll, a poet of great promise, but whose career was

terminated before the promise was fulfilled: he was only shown to us, and then snatched away. He was the second son in a family of nine children, and was born at the farm of Little Tulliebeltane, in the parish of Auchtergaven, in Perthshire, on the 7th of January, 1814. At the time of his birth his father was a farmer in comfortable circumstances; but having rashly become security to the amount of £500 or £600 for a friend who failed, he was reduced to the condition of a day-labourer on the fields which he had formerly rented. It was one of those numerous cases in which Scottish caution is no match for Scottish clannishness. Not only was the worthy ex-farmer thus a sufferer, but his family also; for as fast as they grew up to active boyhood they were sent out to work for their living. Such was the fate of poor Robert Nicoll, who, when only seven years old, was employed in herding all summer, that he might be able to afford attendance at school during the months of winter. It was fortunate for him that with means of education so scanty and precarious, he had, in his mother, the best of all teachers. She taught him to cherish the love and practice of truth—to struggle boldly with adversity, that he might eat, however sparingly, the bread of independence—and, what was better still, she instructed him to rest his hopes and aspirations upon something nobler than mere earthly subsistence. These lessons, moreover, were given not merely in formal words, but also in living practice, for she too was frequently employed in field labour, to contribute her full share in the maintenance of the family, while she endured her hard fate not only with resignation but cheerfulness. When Scotland ceases to abound in such mothers, it will no longer have a history worth recording.

Having thus laid an educational foundation that could bear a superstructure however broad or weighty, Robert Nicoll found that he was fitted for something better than tending cattle. It had now done its good work, as he afterwards testified:—

"A wither'd woodland twig would bring
The tears into my eye:—
Laugh on! but there are souls of love
In laddies herding kye."

He bound himself apprentice to Mrs. J. H. Robertson, wine-merchant and grocer in Perth, and during the little spare time which his new duties allowed him he commenced the work of self-education in good earnest. For this purpose he purchased Cobbett's *English Grammar*, and did not rest till he had made himself master of its principles. He thus writes to his brother: "I am grown very industrious. I read in the morning while sluggards are snoring; all day I attend to my business; and in the fore-nights I learn my grammar." He thus also specifies the amount of his opportunities: "I am employed in working for my mistress from seven o'clock in the morning until nine at night, and I must therefore write when others sleep." His means of intellectual improvement were greatly facilitated by the kindness of a friend, who lent him his ticket to the Perth Library, and the books which he especially selected for study were such as showed the serious cast of his mind: they were Milton's prose works, Locke's works, and several of the writings of Jeremy Bentham, the last of which became his chief favourites. And that he was studying to purpose, the following extract from a letter to his mother will sufficiently attest: "I look upon the earth as a place where every man is set to struggle and to work, that he may be made humble and pure-hearted, and fit for that better land to which earth is the gate. I think, mother, that to me has been given talent; and if so, that

talent was given to make it useful to man. I am determined never to bend to the storm that is coming, and never to look back on it after it has passed. Fear not for me, dear mother; I feel that, whether I be growing richer or not, I am growing a wiser man, which is far better."

On finishing his apprenticeship, Nicoll repaired to Edinburgh; but not finding employment there, he opened a circulating library in Dundee, for which undertaking his affectionate mother lent him £20—to her an absolute fortune—the raising of which must have involved her in trying difficulties, but which he gave himself no rest until he had repaid. It was the year 1835, the year in which he became "of age," and by the character as well as amount of his labour, he soon showed how conscious he was of the duties of full-grown manhood. He became an extensive contributor to the newspapers of the liberal party in Dundee; he delivered political lectures; he made speeches at public meetings. It will be seen from these that he was an enthusiastic politician, as well as a devout believer in the fact that everything good in government can be made better still. But that species of intellectual labour by which he will be best and longest known, and with which we have most to do, consisted of poetry, of which he published a volume, under the title of *Songs and Lyrics*. The chief faults of these were, that they were written in many cases in the Scottish dialect, of which he had not full mastery—and that his language, when impassioned, overflowed into redundancy. Had he lived longer, it is probable that a more matured experience would have induced him to abandon the former, and correct the latter error. Even as it is, however, these poems are admirable, considering that they were written at such an early period: they strike those key-notes of the heart which matured age cannot always reach, but to which old age as well as youth can gladly listen. Indeed, the character and spirit of his poesy, so gentle, so thoughtful, and devout, and withal so imbued with deep truthful feeling, are perhaps best embodied and illustrated in the following extract:—

"The green leaves waving in the morning gale—
The little birds that 'mid their freshness sing—
The wild-wood flowers, so tender-ey'd and pale—
The wood-mouse sitting by the forest spring—
The morning dew—the wild bee's woodland hum,
All woo my feet to nature's forest home.

"There I can muse, away from living men,
Reclining peacefully on Nature's breast—
The wood-bird sending up its God-ward strain,
Nursing the spirit into holy rest!
Alone with God, within this forest fane,
The soul can feel that all save Him is vain.

"Here I can learn—*will* learn—to love all things
That He hath made—to pity and forgive
All faults, all failings. Here the earth's deep springs
Are open'd up, and all on earth who live
To me grow nearer, dearer than before—
My brother loving, I my God adore."

There were times, however, when the heart of Nicoll, otherwise so gentle, could express its feelings in the most indignant outburst. In proof of this we have only to allude to his *Bacchanalian*, a wild, but eloquent and heart-rending appeal in behalf of the poor, on account of the reckless intemperance with which the pangs of starvation and the precariousness of utter poverty are too generally accompanied.

The shop which Nicoll opened as a circulating library gave little promise of success: an attachment, also, which he had formed for a young and amiable woman, whom he wished to make his partner in life, induced him to seek more remunerative occupation, for which he had already shown himself to be fully qualified. He therefore left Dundee in 1836, and

was soon after appointed editor to the *Leeds Times*, through the kind interposition of Mr. Tait, the Edinburgh publisher. He now considered himself settled for life, so that after a short continuance in Leeds he ventured, at the close of 1836, to bid adieu to the love of change, by becoming a married man. Everything now wore the rose-hue of happiness: he had a delightful home and an affectionate partner to animate him in his literary duties; and these duties were so successful, that the journal which he conducted was weekly increasing in circulation. But a cankerworm was at the root of this fair-spreading gourd, and even already it was about to wither. The origin of this is to be found more or less in the nature of provincial journalism over the whole of Britain. Although the *Leeds Times* was a large weekly paper, filled within and without, and so ably managed that its circulation was increasing at the rate of 200 subscribers per week, the salary it afforded was nothing more than £100 per annum. Thus it is that the great political *Jupiter Tonans* of a county town, whose *W*e seems to "shake the spheres," is often the miserable thrall of a knot of shareholders, whose only aim is to secure a large dividend at the smallest amount of outlay; and thus he is compelled to occupy a position in society for which his income is totally inadequate. It is, in short, the very perfection of poverty, because the show of respectability eats up the substance: the larder is empty, that the neat drawing-room may be kept up. All this Robert Nicoll soon experienced; and although he was already overtoiled with the labours of his journal, which he performed without an assistant, he found that additional toil must be endured to meet the necessary expenditure of his station. He therefore undertook, in the spring of 1837, the task of writing the leading articles of a journal newly started in Sheffield; and this, with his duties in the *Leeds Times*, which he continued without abatement, soon turned the balance. His health gave way, and his constitution was broken. He continued to struggle on, and perhaps might have rallied for a new life of exertion, for as yet he had only entered his twenty-third year, but the general parliamentary election in the summer of 1837 interposed, in which the representation of Leeds was contested between Sir John Becket and Sir William Molesworth; Nicoll espoused the cause of the latter, and entered the contest with such ardour that his health was injured beyond recovery. Unable any longer to toil at the editorial desk, he returned to Scotland, in the hope that his native air would cure him; but after a few months of painful lingering he died at Laverock Bank, near Edinburgh, on the 9th of December, 1837. It is gratifying to know that his last days were soled by the kindness of influential friends, whom his genius and virtues had deeply interested in his behalf. After his death a complete edition of his poems was published by Mr. Tait, with a biographical sketch prefixed, from which, and a short article in *Tait's Magazine* by Ebenezer Elliott, we have derived the foregoing particulars.

NIMMO, ALEXANDER, F.R.S.E., M.R.I.A. Among the members of a profession so congenial to the intellectual character of Scotland as that of a civil engineer, Alexander Nimmo deservedly holds an honoured place. He was born at Kirkcaldy, Fifeshire, in 1783. His father, who was distinguished in his own sphere by remarkable talents and acquirements, had originally been a watchmaker, but afterwards kept a hardware store. Alexander's education was commenced at the grammar-school of his native town, afterwards continued for two years at

the university of St. Andrews, and completed at the university of Edinburgh. The result was, that besides being an accomplished scholar in Latin and Greek, he was distinguished for his proficiency in algebra and the higher branches of mathematics. The latter departments, however, by which he was ultimately to be brought into notice, employed the greater part of his attention.

As early occupation was necessary for his limited means, Alexander Nimmo, at the age of nineteen, was obliged to commence the business of life as a schoolmaster. This commencement was honourable to his talents, as well as predictive of his future distinction; for it was as rector of the academy of Inverness, a situation laid open to public competition, which he won by a unanimous vote of the trustees, after an examination of three days, where he had several candidates of high talent for competitors. In this situation his scientific attainments were so highly estimated by Mr. Telford, that the latter recommended him to the parliamentary commission appointed for fixing and determining the boundaries of the Scottish counties. On being employed on this arduous scientific duty Mr. Nimmo accomplished it during the vacations in a manner that gave complete satisfaction. This was attested by a further recommendation of Mr. Telford in his behalf, to the commissioners for reclaiming the bogs of Ireland, by whom he was appointed to the survey. Mr. Nimmo accordingly repaired thither, and not only constructed an admirable series of maps and reports upon the subject, but thoroughly acquainted himself with the character, manners, and necessities of the Irish peasantry, and the best modes of alleviating their poverty. After this survey was finished he made a tour through France, Germany, and Holland, to inspect public works, especially those connected with his new profession.

In consequence of the able manner in which Mr. Nimmo had discharged these public duties, fresh occupations were poured upon him, by which his whole life became one of continual action. The first of these upon his return from the continental tour was the construction of Dunmore harbour, a work of immense difficulty, in consequence of the great depth of water and the heavy roll of the Atlantic to which that coast is exposed. After this followed a commission, in which he was employed by the Fishery Board to make surveys of the harbours of Ireland, and construct harbours and piers all round the coast. Another office connected with this duty, and in which he was employed by the Ballast Board, was to make a chart of the whole coast, which he executed with his usual ability and accuracy. He also compiled a book of sailing directions for St. George's Channel and the Irish coast—a work of high utility in a navigation at that time so imperfectly known, and so full of danger. His services in behalf of Ireland did not here terminate; for, during the great distress of that country in 1822, he was appointed engineer of the western district. The experience which he had formerly acquired while surveying the Irish bogs with a view to their cultivation, was now brought into active practical use; and between the year already mentioned and 1830 he caused £167,000 to be expended in reclaiming waste land, improving what was as yet but partially cultivated, and establishing new settlements, upon which the destitute peasantry were located and employed. The increase of the revenue of that district to the amount of £106,000 per annum was the result of these labours and provident outlay, independently of the industry and comfort which they created, and the moral improvement of the population.

The labours of Mr. Nimmo as a civil engineer, extending to the year 1832, are thus briefly enumerated in the notices of his professional career. Besides his surveys in Scotland and Ireland, above thirty piers or harbours were built upon the Irish coast under his direction. He also designed the Wellesley bridge and docks at Limerick. He superintended the construction of the harbour at Perth Cawl in South Wales. Latterly he was engaged in Lancashire in projecting a railway from Liverpool to Leeds, and also employed upon the Manchester, Bolton, and Bury Railway.

These tasks, which occupied a life of no long continuance, left Mr. Nimmo little time to distinguish himself in authorship, notwithstanding his numerous attainments and ardent love of science in general; and therefore his productions in this way were miscellaneous treatises rather than formal volumes. He wrote an occasional paper for the various periodicals, in which he unbent his mind from the more severe studies of his profession. He also published an article in the *Transactions of the Royal Irish Academy*,

showing how the science of geology might be made available in navigation. He was author of the article in *Brewster's Cyclopædia* on "Inland Navigation." He wrote, jointly with Mr. Telford, the article on "Bridges;" and with Mr. Nicholson that on "Carpentry." The evidence he delivered on the trial between the Corporation of Liverpool and the Medway Company, which has been published, was also greatly admired by mathematicians and engineers, as containing a sound and practical elucidation of the scientific principles of their profession.

As Mr. Nimmo's first success in life was owing to his accomplishments as a scholar, his early love of literature continued with him to the close. His acquirements therefore were extensive, so that besides being well acquainted with the classical languages, he was master of French, German, Dutch, and Italian; he was also thoroughly skilled in the sciences of practical astronomy, chemistry, and geology. He died at Dublin, on the 20th of January, 1832, in the forty-ninth year of his age.

O.

OGILVIE, JOHN, D.D., a poet and miscellaneous writer, was born in the year 1733. His father was one of the ministers of Aberdeen, and he received his education in the Marischal College in that city. Having qualified himself as a preacher, he was settled, in the year 1759, as minister of the parish of Midmar, in Aberdeenshire, where he continued to exercise his useful duties till the close of his life, in 1814. With the exception of the publication of a book and an occasional visit to London, the life of Dr. Ogilvie was marked by hardly any incident. The list of his works is as follows: *The Day of Judgment*, a poem, 1758; a second edition of the same with additional poems, 1759; *Poems on Several Subjects*, 1762; *Providence, an Allegorical Poem*, 1763; *Solitude, or the Elysium of the Poets, a Vision*, 1765; *Paradise*, a poem, and two volumes of poems on several subjects, 1760; *Philosophical and Critical Observations on the Nature, Character, and various Species of Composition*, 1774; *Rome*, a poem, 1775; *An Inquiry into the Causes of Infidelity and Scepticism in all Times*, 1783; *The Theology of Plato compared with the Principles of the Oriental and Grecian Philosophy*, 1793; *Britannia*, an epic poem, in twenty books, 1801; and *An Examination of the Evidence from Prophecy in behalf of the Christian Religion*, 1802.

The name of Ogilvie is certainly not unknown to fame; yet it cannot be said that any of his numerous works has maintained a place in the public eye. To account for this, one of his biographers makes the following remarks: "Ogilvie, with powers far above the common order, did not know how to use them with effect. He was an able man lost. His intellectual wealth and industry were wasted in huge and unhappy speculations. Of all his books there is not one which, as a whole, can be expected to please the general reader. Noble sentiments, brilliant conceptions, and poetic graces may be culled in profusion from the mass; but there is no one production in which they so predominate (if we except some of his minor pieces) as to induce it to be selected for a happier fate than the rest. Had the same talent which Ogilvie threw away on a number of objects

been concentrated on one, and that one chosen with judgment and taste, he might have rivalled in popularity the most renowned of his contemporaries."¹

OGILVIE, JOHN, LL.D. This talented and industrious pioneer in literature, whose labours were so available for its progress, and whose worth was more in substance than show, was the son of a small farmer, and was born in the parish of Mar-noch, Banffshire, in 1797. He was one of a family of six children, who were taught reading at home, and there also received careful moral and religious training, while made useful in farm labours as soon as their strength permitted. The subject of our memoir, after receiving additional instruction for two quarters at a parish school, went out as a farm-servant, and soon became a stout and skilful ploughman. When a boy he had been noted for an insatiable thirst for information, and for asking questions which few who heard them could answer; and in farm service most of his spare time was given to reading, when books were accessible. At the age of twenty-one, in the exercise of his employment, he met with an accidental injury which forced him, after much severe suffering, to submit to the amputation of one of his legs. Unfitted now for farm-labour, he supported himself, for a few years, by teaching a subscription-school in a rural district, eagerly gathering knowledge wherever he could reach it, making considerable unaided progress in mathematics, and often expressing to a friend his regret that he had not got a classical education. Encouraged by this friend he began the study of Latin; and his progress showed how disaster or deprivation, instead of damping the ardour of a brave heart, will stimulate its efforts, and accelerate its progress. In the short space of sixteen months, chiefly by self-teaching, and although conducting his school for three-fourths of the period, he made such progress that, in October, 1824, he gained a high bursary at Marischal College, Aberdeen. Although we use the term *high*, it is in the sense of

¹ *Lives of Eminent Scotsmen*, ii. 137.

university honour merely, for the bursary, measured by pounds, shillings, and pence, was a very small modicum. Such as it was, however, it was enough, aided by a little private teaching, to clear off his college and other expenses, and carry him through his curriculum until he took the degree of A.M. A few years afterwards, on a teachership in Gordon's Hospital, Aberdeen, becoming vacant, he presented himself as candidate for the appointment, and carried it by comparative trial over several others whose qualifications were above the common standard. The lame peasant had having thus fought his way to a comfortable position in society, could employ his leisure hours in those occupations to which his bias directed him, and in which he could win emolument as well as literary distinction.

The commencement of John Ogilvie in authorship was as a poet; and in the local press several of his contributions appeared, especially *Imitations of Horace in the Scottish Garb*, which attracted considerable attention. His ambition in this attempt had probably been awakened by the example of Allan Ramsay, whose Scottish paraphrase of the *Mæneas atavis editæ regibus* of Horace must be known to most of our readers. But although an enthusiast in poetry, and an absolute worshipper of Burns, he was fitted for a higher distinction than that of a fourth-rate poet, or an occasional contributor to provincial magazines and newspapers—and it was perhaps as well for him that the current of his genius and great acquirements was turned into another direction.

While Messrs. Blackie & Son were publishing an edition of Stackhouse's *History of the Bible*, some contributions were sent by Mr. Ogilvie, which were of such a suggestive and satisfactory character, that he was requested to continue his communications; and when the work was completed, the publishers entered into arrangements with him to prepare an English dictionary for popular use. This publication was to be mainly an abridgment of Webster's dictionary; but after many months had been expended in the task, it became evident both to editor and publishers that a more ample work than any abridgment could produce was required. The great and acknowledged desideratum of the day was a complete English and technological dictionary, and nothing less would have proved satisfactory. In consequence of this conviction, the work already done was laid aside, and Mr. Ogilvie commenced anew upon a greatly enlarged and more comprehensive plan. The result of ten years' unremitting labour and research was the "*Imperial Dictionary*, English, Technological, and Scientific." In recognition of the great merits of the *Imperial Dictionary* the Senatus Academicus of Marischal College, Aberdeen, conferred upon Mr. Ogilvie the degree of LL.D. The success of this work, and the direction it had given to his studies, was naturally followed by other cognate productions, in which he was employed during the rest of his life, comprising the long period of thirty years. During the earlier part of it he spent as much time upon these philological occupations as was consistent with his duties in Gordon's Hospital; and after his retirement from that institution, his whole time and that of several assistants was devoted to the works in question.

Of the first and greatest of these works—the *Imperial Dictionary*—something more than a passing notice is necessary. Notwithstanding the great and acknowledged merits of Webster's dictionary, which was adopted as the basis of the *Imperial*, it is not abreast of the present condition of literature, science, and art: many additions and emendations had there-

fore to be introduced, and many Americanisms thrown out. These additions alone amount to 15,000 words, terms, and phrases, which were still further augmented by 20,000 in the "Supplement." In the *Imperial Dictionary*, also, the technical and scientific terms were revised by scientific and practical men who had devoted themselves to the several departments of science and art committed to them for revision, and who besides verifying the definitions of the terms included by Dr. Ogilvie, supplied a number of additional terms, many of them of recent origin. On the appearance of the *Imperial Dictionary*, it was universally welcomed as an invaluable contribution to our literature, and critical journals of every class were loud in its praise. It was pronounced not only the best existing English dictionary, but, so far as the actual state of knowledge permitted, to have made some approach towards perfection. "The extent and value of his labours," writes an experienced practical educationist, "can be appreciated only by those who are acquainted with the condition of English lexicography before the appearance of the *Imperial Dictionary*. Todd's edition of Johnson and Richardson's dictionary were practically the only works of authority in this department available for the students of English. But both of these works, admirable as they are, are limited in their scope; the former confining itself to the definition of common words, with illustrative extracts, while the latter essentially is simply a dictionary of derivations and extracts. In the *Imperial Dictionary* Dr. O. may be said to have inaugurated a new era in this branch of literature, not so much by his modifications and improvements on Webster's, and his addition of many thousands of new words, as by his having combined in it the characteristics of a word-book of the highest class, with those of a succinct but accurate and scientific encyclopedia."

The *Imperial Dictionary* was published in parts, and first appeared in its complete form in 1850, but long before that period the necessity for a "Supplement" to it became apparent. Among the myriads of words defined and explained it was inevitable that many should be omitted; many new terms had sprung up in science and art; and it was considered desirable to introduce such obsolete words contained in Chaucer, Spenser, Shakspeare, and Milton, as had not been included in the dictionary, as also the Scottish words contained in the writings of Burns and Sir Walter Scott. These alone made an addition of 20,000 words, terms, and phrases to the original work. This labour of compilation occupied six additional years before the "Supplement" was finished, and as in the case of the larger work, it underwent a careful revision by writers versed in the different departments of science and art, who also contributed and defined many additional terms.

In 1863 appeared Dr. Ogilvie's "*Comprehensive English Dictionary*, Explanatory, Pronouncing, and Etymological," which is to a large extent a condensation and abridgment of the *Imperial*. In this work the department of pronunciation was confided to the care of Mr. Richard Cull, F.S.A., London. Although less extensive in its range, it retains the principal features of the larger work, and is valuable not only as an English dictionary, but as a work of general reference on miscellaneous subjects.

In 1865 was published the "*Student's English Dictionary*, Etymological, Pronouncing, and Explanatory." In this work the best evidence of Dr. Ogilvie's tact and versatility will be found in accommodating himself to the intellectual requirements of the public. Its appearance was met with universal approval. It was hailed as a great advance beyond any dictionary

of the kind previously published, and has taken its place as a standard. In the *Student's Dictionary* the etymology is more carefully elaborated than in either of the two preceding works, while the meanings are arranged in their natural order of sequence more logically than in any previous dictionary whatsoever, the root meaning being regularly placed the first.

In all these three dictionaries illustrative engravings, inserted in the text, are extensively employed as a means of elucidating significations not otherwise easy of comprehension. The *Imperial Dictionary* was the first in which this useful element was recognized since the days of Bailey.

The last work produced by Dr. Ogilvie was an "*English Dictionary, Etymological, Pronouncing, and Explanatory, for the use of Schools,*" which was published in 1867. It stands in the same relation to the *Student's Dictionary* as the *Comprehensive* does to the *Imperial*, being a succinct and successful abridgment. It was pronounced the most comprehensive and intelligible of all school dictionaries. In all these works, which are so extensively known and highly prized, it is perhaps unnecessary to add that there is abundant proof of Dr. Ogilvie's ability, scholarship, extensive reading, sound judgment, and patient industry. In the preparation of the two lesser dictionaries it is just to add that he received much valuable assistance from Mr. John Wilson, A.M. From this list the nature of Ogilvie's authorship will be seen, as well as the variety of his talents and his unwearied industry, which had thus found an outlet in the way most suited for it. His productions are a literary life-task which few would have dared to face, and which not one litterateur in a thousand could have done so well. Still, with ardour undiminished, he was employed upon a new edition of his great work the *Imperial Dictionary*, when death unexpectedly arrested the brain that had toiled so unweariedly and the hand that had written so much.

Little remains to be added to this brief memoir of Ogilvie. He remained in office in Gordon's Hospital for about thirty years, and in his situation of teacher acquitted himself so satisfactorily, that about eight years before his death, when he retired from office, he was presented by his pupils with a substantial token of their gratitude. During his long tenure of office not only his zeal as a teacher, but his quaint sayings and caustic jokes, had won upon their esteem. He was a man of very retiring manners, yet he was distinguished by his social qualities in company, though sometimes thought misanthropical by those who did not know him, or were unable to appreciate his dry humour. With his life of intellectual toil is also to be taken into account his health, which had never been vigorous after the accident above referred to, and the fact that for many years before his death he was almost blind. In recognition of the boon he had conferred on the nation at large by the eminently useful character of his literary labours, an application was made by his friends to obtain for him a pension on the civil list; but although the application was made by leading men of all sects and parties, it did not meet with the response which might well have been expected. He was seized with typhoid fever in the midst of his literary labours, and after two months of suffering died at Strawberry Bank, Aberdeen, on the 21st of November, 1867, aged seventy years.

OGILVY, JOHN, a poet and geographer, was born in the year 1600 at or near Edinburgh. While he was very young his parents removed with him to London, where his father, some time after, fell into debt, and was confined in the King's Bench Prison.

Notwithstanding family misfortunes the subject of this memoir was able to pick up a slender knowledge of Latin grammar. What is still more to his praise, he put himself apprentice to a teacher of dancing, and with the first money he procured from his master freed his father from confinement. A sprain which he got in dancing at a masque put a temporary stop to his career in this profession and made him slightly lame ever after, yet he is found to have been retained by the celebrated Earl of Strafford as teacher of dancing in his lordship's family, at the same time that he accompanied the earl to Ireland as one of his troop of guards. At this time he wrote a humorous piece, entitled the *Character of a Trooper*. Under favour of the Earl of Strafford he became in time Master of Revels, and built a theatre in Dublin. The civil war, however, which had made shipwreck of the fortunes of his patron, seems to have also blasted the prospects of Ogilvy, who, about the time of its conclusion, arrived in a necessitous condition in London, and soon after applied himself at Cambridge to remedy the defects of his original education. In the latter object he succeeded so far as to be able to publish, in 1649, his translation of Virgil into English verse; which was followed in 1660 by a similar version of Homer. In 1651 he produced the *Fables of Æsop Paraphrased in Verse*, in a quarto volume, with commendatory verses prefixed by Sir William Davenant, and James Shirley, the dramatic poet. Four years afterwards he published another volume of translations from Æsop, with some fables of his own. Ogilvy was a fertile writer of original verses. We are fortunately saved the trouble of making an estimate of his literary character, by Winstanley, whose panegyric, utterly preclusive of all rivalry, is as follows:—"John Ogilvy was one who, from a late initiation into literature, made such progress as might well style him the prodigy of his time; sending into the world so many *large volumes*; his translations of Homer and Virgil, *done to the life*, and with *such excellent sculptures*; and, what added *great grace to his works*, he printed them all on *special good paper* and of a *very good letter*." Miserable as his translation of Homer is allowed to have been, it was a favourite of Pope in his younger days, and it is impossible to say to what extent we may be indebted for the beautiful versions of the latter writer to the early bias thus given to his taste. It is also to be mentioned to the honour of Ogilvy, that the elegance of the typography of his translations was in a great measure owing to his own exertions for the improvement of that art. The engravings, moreover, which he caused to be executed for his Virgil were of such superior merit for their time, as to be afterwards employed in illustrating an edition of the original poet, and subsequently for the decoration of Dryden's translation. At the Restoration our author was replaced in his situation of master of the revels in Ireland, and once more erected his theatre in the capital of that kingdom. His chief attention, however, seems to have been now devoted to the composition of an epic poem, entitled the *Carolies*, in honour of Charles I., the manuscript of which was lost in the great fire of London when his house was burned down. He immediately commenced reprinting all his former publications, and sold them, as he had previously done, by means of a lottery, whereby he now raised £4210, which enabled him to set up a printing-office, for the purpose of producing geographical works, he having received the appointment of cosmographer and geographic printer to the king. In this capacity he projected a general atlas of the world, of which he only lived to complete the parts descriptive of China, Japan,

Africa, Persia, Britain, &c. He also produced several topographical works, one of which, entitled the *Traveller's Guide*, describing the roads of Eng-

land from his own actual survey, was long a well-known and serviceable book. Mr. Ogilvy concluded an active, and upon the whole useful, life, in 1676.

P.

PANTHER, DAVID (whose name is diversely spelled Panter and Paniter), a learned diplomatic character of the sixteenth century, was descended from an ancient family near Montrose. He successively held the ecclesiastical offices of vicar of Carstairs, prior of St. Mary's Isle, commendator of Cambuskenneth, and Bishop of Ross, and in the latter part of the reign of James V., and for some years later, was principal secretary of state. In this latter character he wrote many official letters to foreign courts, which have been highly praised for the extraordinary elegance of their Latinity. In 1722 Ruddiman published two well-known volumes, entitled *Epistole Jacobi Quarti, Quinti, et Marie Regine Scotorum, eorumque Tutorum et Regni Gubernatorum, ad Imperatores, Reges, Pontifices, Civitates et Alios, ab Anno 1505 ad Annum 1545*; of which the whole of the second is the composition of David Panther, while the first contains letters written in a similar official character, by Patrick Panther, his near relation.

Panther subsequently acted for seven years as ambassador of Scotland at the French court. After a life distinguished by high services, but it appears by no great purity of morals, he died at Stirling, October 1, 1558.

PARK, MUNGO, the distinguished African traveller, whose name became a household word, was born at Fowlshiels, in Selkirkshire, September 10, 1771. His father, who rented the farm of Fowlshiels from the Duke of Buccleuch, had thirteen children, of whom Mungo was the seventh. Notwithstanding his limited resources he kept a private tutor in his house for the education of his family; and of the advantage of this arrangement the subject of the present memoir largely partook. He was afterwards sent to the grammar-school of Selkirk, where he made astonishing progress, not so much by his ready talents, as by his remarkable perseverance and application; and, despite of many disadvantages, uniformly kept the place of *dux*, or head of his class. This early devotion to study and aptitude of acquirement, together with his thoughtful and reserved disposition, seemed to his father to point out the church as his future profession, but upon his son's expressing a decided preference for that of medicine, he at once agreed, and bound him apprentice for three years to Mr. Thomas Anderson, surgeon in Selkirk. At the close of his indenture, in 1789, being then eighteen years of age, he went to Edinburgh, and attended the classes for three successive sessions, continuing to exhibit the same thirst of knowledge, and unwearied application to all the studies connected with his profession, particularly botany. In the latter he is said to have been greatly assisted and encouraged by a brother-in-law, Mr. James Dickson, who, from an origin even more humble and obscure than that of Park himself, subsequently raised himself to fame and fortune, and became celebrated as one of the first botanists in the kingdom. He had gone to London in search of employment as a journeyman gardener, and procured

an engagement in that humble capacity with a nurseryman at Hammersmith, where he had the good fortune to attract the notice of Sir Joseph Banks, to whose kind friendship and patronage he was mainly indebted for his future success and celebrity.

After qualifying himself in his profession at Edinburgh, young Park went to London in search of employment, and was very speedily appointed assistant-surgeon on board the *Worcester*, East Indiaman, through the interest of Sir Joseph Banks, to whom Mr. Dickson had introduced him. Mr. Park showed himself every way worthy of this appointment, and made an adequate return to his distinguished patron, by the valuable observations and discoveries he made in botany and other branches of natural history, in a voyage to Bencoolen, in the island of Sumatra. On his return in 1794, being then only twenty-three years old, he had the honour of reading a paper before the Linnæan Society in London, giving a description of eight new species of fishes he had observed in Sumatra, which was afterwards published in the *Transactions* of the society.

After leaving the *Worcester*, Mr. Park appears to have had no certain or fixed views as to his future career, but his talents and genius had already distinguished him too much to allow him to remain long unemployed. The wealthy and scientific Association for the Promotion of Discovery through the Interior of Africa were at that time preparing to send out an expedition, with the view of endeavouring to trace the course of the Niger, and procuring every information relative to the great central city of Timbuctoo, of which little more than the name was then known. Sir Joseph Banks, one of the leading men of the association, immediately pointed out Park as one peculiarly eligible for taking the management of the expedition, and the offer being accordingly made to him, was eagerly accepted. He immediately prepared himself, therefore, for the task, being liberally supplied, according to his own statement, with the means of furnishing himself with everything he reckoned necessary, and sailed from Portsmouth on the 22d of May, 1795, in the brig *Endeavour*. His instructions were to proceed to the Niger by the nearest and most convenient route, and endeavour to trace its course, from its rise to its termination; as also to visit, if possible, all the principal towns and cities on its banks, particularly Timbuctoo and Houssa, and afterwards return to Europe by the river Gambia, or any other way he thought advisable. He arrived at Jillifica, in the kingdom of Barra, and lying on the northern bank of the Gambia, on the 21st of June; and after proceeding up the river as far as Jonkakonda, he quitted the *Endeavour*, and proceeded by land to a small British factory which had been established at Pisania, in the King of Yam's territories, where he took up his residence for a short time with Dr. Laidley. He immediately applied himself to the study of the Mandingo tongue, and to collect all the information possible relative to the various people and countries in the interior, preparatory to his journey. In consequence, however, of exposure to the night dew

while observing an eclipse of the moon in the month of July, he was seized with fever, attended with delirium, which brought him almost to the grave; nor was he sufficiently recovered to commence his journey till December. On the 2d of that month he set out, having for his escort a negro servant, named Johnson, who had resided many years in Great Britain and understood both the English and Mandingo languages, as a guide and interpreter; a negro boy belonging to Dr. Laidley, and whom that gentleman promised to set free on his return, in the event of his good conduct; with four others, not immediately under his control, but who were made to understand that their own safety depended upon their fidelity to him. It may be interesting also to notice the nature and value of his equipments for a journey of such length, peril, and importance. These consisted of a horse for himself, two asses for his servants, provisions for two days, a small assortment of beads, amber, and tobacco, a few changes of linen and other apparel, an umbrella, a pocket-sexant, a magnetic compass, a thermometer, two fowling-pieces, two pairs of pistols, and a few other trifling articles. Such were all the means of sustenance, comfort, and safety, with which this intrepid man was provided for an expedition the duration of which it was out of his power to calculate, but whose route, he well knew, lay in some places through pathless deserts, where neither tree grew nor water ran, and beset with beasts of prey; in others, through the territories of barbarous tribes, from whose inhospitality or savage dispositions he had scarcely less to fear.

At the very outset an event occurred which seemed to bode ill for the result of his journey. Dr. Laidley, and a few other of the Europeans at Pisania, having escorted him during the first two days, bade him adieu, convinced that they would never see him more; and scarcely were they out of sight when he was surrounded by a horde of native banditti, from whom he only got free by surrendering the greater part of his small store of tobacco. Park, however, was not a man to be depressed by evil auguries, and he accordingly pushed on to Medina, the capital of Woolli, where the king, a benevolent old man, received him with much kindness, and furnished him with a trusty guide to the frontiers of his dominions. Our traveller then engaged three elephant-hunters as guides and water-bearers through the sandy desert which lay before him, where water was frequently not to be found for several days together. He performed the journey in safety, but after much fatigue, and reached Fatteconda, the residence of the King of Bondon, situated upon the very frontiers of his dominions, adjoining the kingdom of Kajaaga. It was at Fatteconda, and at the hands of the same chief, that Park's predecessor in enterprise, Major Houghton, had received such ill-usage, and was plundered of almost everything he possessed; but the only article he exacted from Park, and that not by force but by such warm and animated expressions of admiration as left our traveller no alternative to choose, was his new blue coat, with gilt buttons, in return for which he presented him with five drachms of gold. From Fatteconda he proceeded to Joag, the frontier town of Kajaaga, travelling in the nighttime for fear of robbers, and through thickets abounding with wolves and hyenas, which glided across their silent path in the clear moonshine, and hung round the small party with yells and howlings, as if watching an opportunity to spring upon them. At Joag, and whilst preparing to proceed on his journey, he was honoured by a visit from the king's son, who plundered him of the half of his little stores, on pre-

tence of his having forfeited all his property by entering the kingdom without leave. As a sort of consolation for this disaster, and whilst appeasing his hunger with a few ground-nuts which a poor negro slave had given him in charity, he was waited upon by the nephew of the King of Kasson, who had been at Kajaaga on an embassy, and who, taking pity on him, offered to escort him to his uncle's capital, to which he was now returning, and which lay in the line of our traveller's route. After crossing the river Senegal, however, which was the boundary of Kasson, his royal guide left him, having first taken from him the half of the little property he had left. A few days after this Park, for the first time, had an opportunity of observing the manners of the barbarous and untutored natives of Africa in all their primitive simplicity and unchecked ardour. They came to a village which was the birth-place of one of his faithful escort, a blacksmith that had accompanied him from Pisania, and who was now about to leave him, having amassed a considerable deal of money in his profession on the coast, and resolving to spend the rest of his days in ease and independence amongst his family and friends. The meeting which ensued was characterized by the most extravagant demonstrations of joy and triumph, and Park was convinced that, "whatever difference there is between the negro and European in the conformation of the nose and the colour of the skin, there is none in the genuine sympathies and characteristic feelings of our common nature."

With these warm-hearted villagers our traveller rested for a day or two, and then proceeded to Kooniakary, where the king, a worthy old man who was greatly beloved by his subjects, received him with much kindness. From this point new perils beset Mr. Park's further progress, in consequence of war breaking out between the people of Bambarra, to which kingdom his course was directed, and other tribes, through whose territories he had to pass on his way thither. He nevertheless persevered, although even his faithful negro Johnson, who was aware of the dangers he was running into, refused to accompany him farther. They parted accordingly at Jarra, in the kingdom of Ludimar (the people of which, as well as of the neighbouring nations, were found to be Mahometans), and Mr. Park, having intrusted Johnson with a copy of his journal to carry back with him to Pisania, set out for the camp of Ali at Benowm, accompanied only by Dr. Laidley's slave-boy and a messenger who had arrived from Ali to conduct him thither. On the way he suffered great privations, and was repeatedly beaten and robbed by the fanatical Moors, to whom he was an object of peculiar detestation as a Christian. All the sufferings and insults which he had yet undergone, however, were nothing to what he was doomed to endure while in the power of the tyrant Ali. His appearance at Benowm excited the greatest astonishment and consternation amongst the inhabitants, scarcely one of whom had ever seen a white man before. When taken before Ali, the latter was engaged in the dignified occupation of clipping his beard with a pair of scissors, and paid little regard to him; but the ladies of the court fully maintained the character of their sex for inquisitiveness, searched his pockets, opened his waistcoat to examine his white skin, and even counted his toes and fingers to make sure of his being human. It would occupy far more space than the limits of this memoir will allow, to detail the innumerable and unremitting sufferings of our unfortunate countryman during his detention at this place. The unfeeling tyrant would neither permit him to depart, nor grant him any protection from the per-

secution of the fanatical rabble. He was beat, reviled, compelled to perform the meanest offices, frequently on the point of starvation, and was often necessitated to sleep in the open air. All his baggage was taken from him to deter him from running away, with the exception of a pocket compass, which was supposed to be the work of magic, from the needle always pointing in the same direction, and was therefore returned to him. At last it began to be debated how he was to be disposed of—some advising that he should be put to death, others that his right hand should be cut off, and another party that his eyes should be put out. Park's health at length gave way under the accumulated horrors of his situation, and he was seized with a fever and delirium, which brought him to the brink of the grave. Yet even in this extremity his persecutors never desisted from their cruelties, and tormented him like some obnoxious animal for their amusement. Perhaps the strongest proof that can be given of the extent of his sufferings at this time, and of the deep and lasting impression they made on his mind, is the fact, that years afterwards, subsequent to his return to Scotland, and while residing with his family on the peaceful banks of the Tweed, he frequently started up in horror from his sleep, imagining himself still in the camp of Ali at Benownm. But perhaps nothing gave our traveller so much permanent grief as the fate of his faithful slave-boy Demba, whom Ali impressed into his service as a soldier, and who had conceived a great affection for Mr. Park, who describes their parting as very affecting.

After a month's residence at Benownm Ali removed to Jarra, back to which place of course Mr. Park was obliged to accompany him. Here all was alarm and terror, from the approach and apprehended attack of the King of Kaarta; and amid the bustle and confusion of the inhabitants fleeing from their homes, the preparations for war, &c., Mr. Park at last, after great difficulty and amid many perils, found an opportunity of escaping, and struck into the woods back towards Bambarra. Being under the necessity of avoiding all intercourse with the natives, in order to avoid being recaptured by the emissaries of Ali, who were in pursuit of him, he was at one time nearly famished in the wilderness, and we will take his own account of his sensations at this awful crisis. Thirst, intense and burning thirst, was the first and direst of his sufferings; his mouth and throat became parched and inflamed, and a sudden dimness frequently came over his eyes, accompanied with symptoms of fainting. The leaves of the few shrubs that grew around were all too bitter for chewing. After climbing up a tree in the hopes of discovering some signs of a human habitation, but without success, he again descended in despair. "As I was now," says he, "too faint to attempt walking, and my horse too fatigued to carry me, I thought it but an act of humanity, and perhaps the last I should ever have it in my power to perform, to take off his bridle and let him shift for himself; in doing which I was affected with sickness and giddiness, and, falling upon the sand, felt as if the hour of death was fast approaching. Here then, thought I, after a short but ineffectual struggle, terminate all my hopes of being useful in my day and generation; here must the short span of my life come to an end. I cast, as I believed, a last look on the surrounding scene; and whilst I reflected on the awful change that was about to take place, this world and its enjoyments seemed to vanish from my recollection. Nature, however, at length resumed her functions; and on recovering my senses, I found myself stretched upon the sand, with the bridle still in my hand, and the

sun just sinking behind the trees. I now summoned all my resolution, and determined to make another effort to prolong my existence: and as the evening was somewhat cool, I resolved to travel as far as my limbs would carry me, in hopes of reaching (my only resource) a watering-place. With this view I put the bridle upon my horse, and driving him before me, went slowly along for about an hour, when I perceived some lightning from the north-east; a most delightful sight, for it promised rain. The darkness and lightning increased very rapidly, and in less than an hour I heard the wind roaring behind the bushes. I had already opened my mouth to receive the refreshing drops which I expected, but I was instantly covered with a cloud of sand, driven with such force by the wind, as to give a very disagreeable sensation to my face and arms; and I was obliged to mount my horse and stop under a bush to avoid being suffocated. The sand continued to fly for nearly an hour in amazing quantities, after which I again set forwards, and travelled with difficulty until ten o'clock. At this time I was agreeably surprised by some very vivid flashes of lightning, followed by a few heavy drops of rain. I alighted, and spread out all my clean clothes to collect the rain, which at length I saw would certainly fall. For more than an hour it rained plentifully, and I quenched my thirst by wringing and sucking my clothes."

Park at length entered the kingdom of Bambarra, where he found the people hospitable, and was astonished at the opulence and extent of cultivation he everywhere found. The country, he says, was beautiful, intersected on all sides by rivelets, which, after a rain-storm, were swelled into rapid streams. He was, however, such an object of amusement and ridicule to the inhabitants, from his own tattered condition, together with the appearance of his horse, which was a perfect skeleton, and which he drove before him, that the very slaves, he says, were ashamed to be seen in his company. Notwithstanding all this, however, he held on his way, and at last, on the 21st of July, 1796, had the inexpressible gratification of coming in sight of Sego, the capital of Bambarra, situated on the Niger, which the natives denominated *Joliba*, or the "Great Water." "As we approached the town," says Park, "I was fortunate enough to overtake the fugitive Kaartans, and we rode together through some marshy ground, where, as I anxiously looked around for the river, one of them called out *Geo affilli* (see the water). Looking forwards, I saw, with infinite pleasure, the great object of my mission—the long-sought-for majestic Niger, glittering to the morning sun, as broad as the Thames at Westminster, and flowing slowly to the eastward. I hastened to the brink, and having drunk of the water lifted up my fervent thanks in prayer to the great Ruler of all things, for having thus far crowned my endeavours with success." Sego consisted of four distinct towns, two on the northern and two on the southern bank of the Niger; "and the view of this extensive capital," says our traveller, "the numerous canoes on the river, the crowded population, and the cultivated state of the surrounding country, formed altogether a prospect of civilization and magnificence which I little expected to find in the bosom of Africa." The king, Mansong, however, refused to see Mr. Park, for fear of exciting the envy and jealousy of the Moorish inhabitants, and ordered him to remove to a village in the vicinity. He had no alternative but to comply; and it was here that one of those fine traits of female compassion, and of the kind interposition of Providence in his favour when at the last extremity, which he has frequently borne testimony to with thankfulness

and gratitude, occurred; and this truly affecting incident we cannot avoid giving in his own simple language. On arriving at the village he was inhospitably driven from every door with marks of fear and astonishment. He passed the day without victuals, and was preparing to spend the night under a tree exposed to the rain and the fury of the wild beasts, which there greatly abounded, "when a woman, returning from the labours of the field, stopped to observe me, and perceiving me weary and dejected, inquired into my situation, which I briefly explained to her; whereupon, with looks of great compassion, she took up my saddle and bridle, and told me to follow her. Having conducted me into her hut she lighted up a lamp, spread a mat upon the floor, and told me I might remain there for the night. Finding that I was very hungry she said she would procure me something to eat; she accordingly went out, and returned in a short time with a very fine fish, which having caused to be broiled upon some embers, she gave me for supper. The rites of hospitality being thus performed towards a stranger in distress, my worthy benefactress (pointing to the mat and telling me I might sleep there without apprehension) called to the female part of her family, who had stood gazing on me all the while in fixed astonishment, to resume their task of spinning cotton, in which they continued to employ themselves great part of the night. They lightened their labour with songs, one of which was composed extempore, for I was myself the subject of it; it was sung by one of the young women, the rest joining in a chorus. The air was sweet and plaintive, and the words, literally translated, were these: 'The winds roared and the rains fell. The poor white man, faint and weary, came and sat under our tree—he has no mother to bring him milk, no wife to grind his corn.' Chorus—'Let us pity the white man; no mother has he!' &c. &c. Trifling as this recital may appear to the reader, to a person in my situation the circumstance was affecting in the highest degree. I was so oppressed by such unexpected kindness, that sleep fled before my eyes. In the morning I presented my compassionate landlady with two of the four brass buttons that remained on my waistcoat, the only recompense I could make her."

Mansong, the king, having ordered Park to leave the neighbourhood (sending him, however, a guide, and a present of 5000 cowries as some recompense for his involuntary inhospitality), our traveller proceeded down the Niger along the northern bank. On one occasion, while passing through the woods, he narrowly escaped being devoured by a large red lion, which he suddenly came upon crouching in a bush, but which did not attack him. He proceeded first to Sansanding, thence to Moodiboo, Moorzan, and finally to Silla. Here, worn out by fatigue and suffering of mind and body, destitute of all means either of subsistence or of prosecuting his journey—for even his horse had dropped down by the way—his resolution and energy, of which no man ever possessed a greater share, began to fail him. The rainy season had set in and he could only travel in a canoe, which he had no money to hire; and he was advancing farther and farther into the territories of the fanatical Moors, who looked upon him with loathing and detestation, and whose compassion he had no gifts to propitiate. It was with great anguish of mind that he was at last brought to the conviction of the necessity of returning; but no one who has read his own simple and manly statement of his actual situation, and of the prospect before him, together with his poignant sensations at his disappointment, can for a moment blame him for turning back. Pre-

paratory to doing so he collected all the information in his power respecting the future course of the Niger, and the various kingdoms through which it flowed; but subsequent discoveries have since proved how little credit could be attached to the accounts of the natives, either from their positive ignorance or their suspicious jealousy of strangers. Later and more fortunate travellers have solved the great problem, the honour of explaining which was denied to Park; and we now know that this great river, after flowing to a considerable distance eastward of Timbuctoo, makes a bend or elbow, like the Burampooter, and after pursuing a south-westerly course, falls into the Atlantic Ocean on the coast of Benin. The narrative of Mr. Park's return from the interior of Africa would be little else than a repetition of the various sufferings, adventures, and dangers he experienced on his way there, but only in a more aggravated form, in consequence both of his utterly destitute condition, and from the inundation of the level country, which compelled him to seek his way over chasms and precipices, without a guide, or any other means of shaping his course. He frequently waded for miles breast-deep in water. Once he was beset by banditti who stripped him of everything but two shirts, his hat, and a pair of trousers; and on arriving at Sibidooloo, he was attacked by fever, which stretched him on his back for many weeks. Here, however, he was fortunate enough to meet with a slave-merchant, named Karfa Taura, who treated him with great kindness and humanity—took him into his own house—nursed him until he was well—kept him as his guest for seven months without asking the smallest recompense—and finally conducted him in safety to Pisanía, with a cargo of his living merchandise. Our traveller immediately took his passage in an American vessel bound for the West Indies, whence he had no difficulty in getting to Britain, and landed at Falmouth on the 22d of December, 1797, after an absence of two years and seven months.

Mr. Park was received with distinguished honour by the African Association and almost all the other scientific bodies and eminent literary characters of the metropolis, and was for some time what is familiarly termed the *lion* of the town. Having made arrangements in London for the publication of his travels, he proceeded to Scotland in June, 1798, and spent the succeeding summer and autumn at his native place, Fowlshiels, among his relations and friends, his mother being the only parent then alive. His time, however, was far from being passed in idleness, or merely in social meetings with old friends and acquaintance, much as his company, as may readily be imagined, was sought after. He applied himself indefatigably to the compilation and composition of his travels, which he finished and carried back with him to London in the end of the year. In the following spring they were published, and it is needless to say how universally, or with what avidity, not to mention *incredulity* by many, they were read. For the latter contingency Mr. Park himself was prepared, and with a judicious caution, which few of his rivals in discovery, either before or since, have had the prudence or *self-denial*, as it may aptly be termed, to adopt, omitted the relation of many real incidents and adventures, which he feared might shake the probability of his narrative in the public estimation. This fact has been proved beyond doubt by the testimony of many of his intimate friends and relatives, to whom, although by no means of a communicative disposition, he freely mentioned many singular anecdotes and particulars which he scrupled to submit to the jealous eye of the

critical public. Amongst those friends to whom Mr. Park frequently communicated in a colloquial way many most interesting and remarkable circumstances which did not appear in his printed travels, was Sir Walter Scott, between whom and Mr. Park a strong intimacy was contracted subsequent to the return of the latter from Africa, and who tells us, that having once noticed to his friend the omissions in question (which appeared to one of his romantic temperament and ardent imagination to be unaccountable), and asked an explanation, Mr. Park replied, "that in all cases where he had information to communicate which he thought of importance to the public, he had stated the facts boldly, leaving it to his readers to give such credit to his statements as they might appear justly to deserve; but that he would not shock their credulity, or render his travels more marvellous, by introducing circumstances, which, however true, were of little or no moment, as they related solely to his own personal adventures and escapes." If this scrupulousness on the part of the traveller is to be regretted in one sense, as consigning to oblivion many curious and interesting facts, it certainly raises him as a man and an author incalculably in our estimation, and bespeaks the most implicit belief and confidence in what he has promulgated to the world.

After the publication of his travels he returned to Scotland, and in August the same year married Miss Anderson, the eldest daughter of his old master at Selkirk. For some time after his marriage, and before he set out on his second expedition, Mr. Park appears to have been quite undecided as to his prospects in life; and perhaps the comparative independence of his circumstances, from the profits of his publication and the remuneration he obtained from the African Association, rendered him somewhat indifferent to any immediate permanent situation. But it was likewise strongly suspected by his intimate friends, that he entertained hopes of being soon called upon to undertake another mission to the Niger, although he kept perfectly silent on the subject.

As time continued to elapse without any such proposition from the expected quarter being made, Mr. Park perceived the imprudence of remaining in idleness, and in 1801 removed to Peebles, where he commenced practice as a surgeon. But it would appear he was not very successful in this speculation; and this fact, together with the natural restlessness of his disposition, seems to have rendered his situation peculiarly irksome to him. In answer to a friend who suspected his design of again proceeding abroad, and earnestly remonstrated with him against it, he writes, "that a few inglorious winters of practice at Peebles was a risk as great, and would tend as effectually to shorten life, as the journey he was about to undertake." In the meantime his *ennui* or impatience was much relieved by the enjoyment of the best society in the neighbourhood, and by being honoured with the friendship of many of the most distinguished characters in Scotland at that time. Amongst these were the venerable Dr. Adam Ferguson, then resident at Hallyards, near Peebles; Colonel Murray of Cringletie; and Professor Dugald Stewart. As before mentioned, too, a strong intimacy sprung up between our traveller and Sir Walter Scott, then but little known in the literary world, and who resided with his family at Ashiestiel, on the banks of the Tweed. This friendship commenced in 1804, after Mr. Park had removed from Peebles to Fowlshiels and was preparing for his second expedition to Africa, of which he had then got intimation. It is pleasing to know the cordiality and affectionate familiarity which subsisted between

these celebrated men, and also that it arose from a marked congeniality in their tastes and habits.¹ Park was an enthusiastic lover of poetry, especially the minstrelsy with which his native district was rife; and although he made no pretensions to the laurel crown himself, he occasionally gave expression to his feelings and thoughts in verse, even from his earliest years. It was little wonder, then, that he should own a particular predilection for the society of one whose heart and memory were so richly stored with the ancient ballad lore of his country, although his reserve towards strangers in general, which was carried even to a repulsive degree, was notorious. In particular Sir Walter Scott has noticed the strong aversion of his friend to being questioned in a promiscuous company on the subject of his adventures, of which grievance, as may be imagined, he had frequent cause to complain.

The new mission to Africa, which was now sanctioned and promoted by government, had been projected so far back as 1801; but owing to changes in the ministry, and other causes of delay, the preparations for it were not completed till 1805. Mr. Park parted from his family, and proceeded to London with his brother-in-law, Mr. James Anderson, who, as well as Mr. Scott, an artist, had resolved to accompany him in his expedition. On this occasion Mr. Park received the brevet commission of captain in Africa, and a similar commission of lieutenant to his relative Mr. Anderson. Mr. Scott also was employed by government to accompany the expedition as draughtsman. Mr. Park was, at the same time, empowered to enlist soldiers from the garrison of the island of Goree, to the number of forty-five, to accompany him in his journey; and the sum of £5000 was placed at his disposal, together with directions as to his route, &c. The expedition sailed from Portsmouth on the 30th January, 1806, and arrived at Pisanía on the 28th of April, where preparations were immediately made for the inland journey. The party consisted of forty men, two lieutenants, a draughtsman (Mr. Scott), and Park himself; they had horses for themselves, and asses for carrying the provisions and merchandise. Mr. Park wrote to several friends at home, previously to setting out, in the highest spirits, and seemingly perfectly confident of success. In his letter to Mr. Dickson, he says, "This day six weeks I expect to drink all your healths in the Niger;" and again, "I have little doubt but that I shall be able, with presents and fair words, to pass through the country to the Niger; and if once we are fairly afloat, *the day is won*." Alas! how sadly these sanguine expressions contrast with the melancholy issue of the expedition. Park's chance of reaching the Niger in safety depended mainly upon his doing so previously to the commencement of the rainy season, which is always most fatal to Europeans; but scarcely had they got half-way when the rain set in, and the effect on the health of the men was as speedy as disastrous. They were seized with vomiting, sickness, dysentery, and delirium; some died on the road, others were drowned in the rivers, and several were left in the precarious charge of the natives in the villages. Some, still more unfortunate, were lost in the woods, where they would inevitably be devoured by wild beasts; while the native banditti, who imagined the caravan to contain immense wealth, hung upon their march and plundered them at every opportunity. In crossing the Wondou, they nearly lost their guide Isacco by a large crocodile, which pulled him below

¹ It chanced that they were born within a month of each other.

the water several times, but from which he at last got free, much lacerated. At another time they were encountered by three large lions, but which took to flight at the sound of Mr. Park's musket. At last the miserable remnant of the party—only nine out of forty-four, and these nine all sick, and some in a state of mental derangement—reached Bambakoo, on the Niger. Here Mr. Scott was left behind on account of sickness, of which he shortly died; while the rest proceeded to Sego, the capital of Bambarra, which they reached on the 19th of September. Mansong was still king, and was so highly gratified with the presents brought to him, that he gave them permission to build a boat, and promised to protect them as far as lay in his power. Mr. Park forthwith opened a shop for the sale of his European goods, which immediately obtained such demand, that his shop was crowded with customers from morning till night, and one day he turned over no less than 25,756 cowries. Here, however, he lost his brother-in-law Mr. Anderson, a circumstance which afflicted him greatly, and made him feel, as he himself expressed it, "as if left a second time lonely and friendless amidst the wilds of Africa." But not all the sufferings he had undergone—the loss of his companions, or the dismal condition of the remainder, and the perilousness of his situation—nothing could damp the native ardour of his mind. Having got a sort of schooner constructed and rigged out, he prepared for setting out on his formidable journey, previously to which, however, he took care to bring his journal up to the latest hour, and wrote several letters to his friends and relatives in Britain. These were intrusted to his faithful guide Isaaco, to carry back to the Gambia, whence they were transmitted to England. His letter to Mrs. Park, excepting that part of it which mentions the death of her brother and Mr. Scott, was written in a cheering and hopeful strain; speaks with confidence of his reaching the ocean in safety, and of the probability of his being in England before the letter itself! His companions were now reduced to four, viz. Lieutenant Martyn and three soldiers, one of whom was deranged in his mind; and with this miserable remnant, and a guide named Amadi Fatouma, he set sail, as near as could be ascertained, on the 19th of November, 1806. The progress of the unfortunate travellers after this period, and their ultimate fate, so long a mystery, are now familiarly known, although there are many circumstances attending the unhappy closing scene which are yet shrouded in doubt and uncertainty.

Vague rumours of the death of Park and his companions were brought by some of the natives to the British settlements on the coast even so early as the end of 1806; but no information could be got for several years of a nature to be at all relied on, during which time the suspense of his friends and of the public at large, but more particularly of his afflicted family, was of the most painful nature. At length, in 1810, Colonel Maxwell, governor of Senegal, despatched Isaaco, Park's former guide, into the interior, in order to ascertain the truth or falsehood of the reports which prevailed. After an absence of a year and eight months this individual returned, and the many facts of the narrative which he gave as the result of his labours, are not only but too probable in themselves, but seem to have been thoroughly confirmed by the investigations of subsequent travellers. Isaaco stated that he had fallen in with Mr. Park's guide, Amadi Fatouma, at Medina, near Sansanding, who, on seeing Isaaco, and hearing the name of Park, began to weep, saying, "They are all dead;" and was with great difficulty induced to detail

the melancholy circumstances of the catastrophe. The account which he gave is too long to be introduced entire here, but the substance of it was as follows:—After leaving Sansanding, Mr. Park navigated his way down the Niger, as far as Boussa, in the kingdom of Yaour, which was more than two-thirds of the distance between the ocean, or Gulf of Guinea, and where the river is termed by the natives *Quorra*. They had frequent skirmishes with the natives, particularly in passing Timbuctoo, where several of the natives were killed. On reaching Yaour Mr. Park sent Amadi Fatouma ashore with various presents, some of which were to the chief or governor of the place, but the most valuable portion for the king, to whom the chief was requested to send them. A short while after, the latter sent to inquire if Mr. Park intended to come back; and on being answered that he could return no more, the treacherous chief appropriated the presents intended for the king to his own use. This piece of knavery proved fatal to the unfortunate travellers. The king, indignant at the supposed slight cast on him, assembled a large army at the above-mentioned village of Boussa, where a large high rock stretches across the whole breadth of the river, the only passage for the river being through an opening in the rock in the form of a door. The army posted themselves on the top of the rock, and on Mr. Park's attempting to pass, assailed him with lances, pikes, arrows, stones, and missiles of every description. The beleaguered travellers defended themselves for a long time, till all were either killed or severely wounded; when, seeing the uselessness of further resistance, Mr. Park, Lieutenant Martyn, and one or two more, jumped out of the boat, and were drowned in attempting to get ashore. Only one slave was left alive. Such was the narrative of Amadi Fatoumi, who had left Mr. Park at Yaour, where his engagement with him terminated, and where he was for many months afterwards confined in irons on suspicion of having purloined the presents intended for the king, which had been made away with by the treacherous chief. Amadi had obtained the accounts of the fatal scene from those who had taken a part in it. The natives afterwards endeavoured to account for the disappearance of Park, to the inquiries of subsequent travellers, by saying that his vessel had foundered against the rock, and that he and his companions were drowned by accident. But there is now not the shadow of a doubt that the above narrative of Amadi is substantially true.

So perished Mungo Park, in the thirty-fifth year of his age—a man whose natural enthusiasm, scientific acquirements, undaunted intrepidity, patience of suffering, and inflexible perseverance—in short, every quality requisite for a traveller in the path he adopted—have never been surpassed, and who, had he survived, would no doubt have reaped those laurels which more fortunate successors in the same career have won. To these qualities in his public character, it is pleasing to be able to add those of amiable simplicity of manners, constancy of affection, and sterling integrity in private life.

Mr. Park's papers were, with the exception of a few scraps,¹ unfortunately all lost with him, and this is much to be regretted, as, notwithstanding the important discoveries of the Landers, who subsequently

¹ These were an old nautical publication (of which the title-page was missing, and its contents chiefly tables of logarithms), with a few loose memoranda of no importance between the leaves. One of these papers, however, was curious enough, from the situation and circumstances in which it was found. It was a card of invitation to dinner, and was in the following terms:—"Mr. and Mrs. Watson would be happy to have the plea-

traced the course of the Quorra or Niger from Boussa, where Park fell, down to the Gulf of Guinea, they were unable to explore a great part of that immense portion of it which flows between Boussa and Timbuctoo, and which Park must of necessity have navigated. Their united labours have, however, solved the grand problem which has engaged the attention of all civilized nations from the earliest ages to which history leads us back; and there seems little cause for doubt, that, in a short time, the still broken links in the great chain of communication with the centre of Africa will be united.

PARK, PATRIC. This talented sculptor, whose career was cut short by a premature death when his professional excellence had attained maturity and given promise of a career of distinction, was born in Glasgow in 1811. His father was Matthew Park, a distinguished builder in that city, who erected the new part of Hamilton Palace. Having shown in early life a decided taste for art, especially in relation to sculpture, he went to Rome, and studied as a pupil under Thorwaldsen; and on his return he settled in London, and was much employed in bust-sculpture, so that at different periods he had a studio in Glasgow and Edinburgh, and in the later period of his life at Manchester. Among the numerous busts which he executed of the most eminent characters of the day, was one of Napoleon III., whom, as a subject for an artist, he greatly admired, and of whom he produced a likeness in marble distinguished for its faithfulness of resemblance and beauty of execution. This bust is now in the South Kensington Museum. Of his other busts we may particularize those of Thomas Campbell, author of the *Pleasures of Hope*; of Mr. Layard, M.P., General Sir Charles Napier, the Duke of Cambridge, Lord Macaulay (now in possession of Lady Trevelyan), Lord Jeffrey, D. O. Hill, R.S.A., Sir Archibald Alison, and Professor Ayton; and of these, the last two have been engraved. Another bust not inferior to his choicest productions, entitled *A Scottish Lassie*, now belonging to the Royal Scottish Academy, and placed in the National Gallery of Scotland at Edinburgh, being a likeness of his wife idealized, is particularly worthy of notice and commendation.

Although the excellence of Patric Park as an artist was thus so generally recognized, and so largely employed, he was dissatisfied with the mere production of busts; his ambition aspired to complete large, open-air statues, a higher department of art, and better fitted for his genius; but in this longing he was disappointed, as no commission of the kind was offered to him. It may have been that the eccentricities of genius, of which he had no small share, would have made his idealizations not only too poetical for the common taste, but have overrun the established bounds of art; and that in public monumental effigy, with the prosaic multitude for judges, he would have only subjected himself to failure, and it may be also to ridicule. At all events, such was the result of the only attempt he made upon the public to vindicate his claims as a sculptor of history. The subject of his selection was an allegorical statue of Sir William Wallace; the place of its exhibition was Edinburgh; and in due time the eyes of Modern Athens were astonished with the display of a colossal

statue of the revered national champion in plaster of Paris with the Scottish lion by his side. Could this be Wallace? Nothing was to be seen but a huge, burly, naked athlete, ready for the field of glory, and the lion raising his tail in token that he was ready to second the onset. The puzzled spectators, unless they had been told that this king of men and king of beasts meant the Scottish hero and the Scottish nation, might have mistaken it for Samson and the lion which he tore in pieces, or Androclus and his shaggy friend of the forest taking an airing after the lamed foot of the latter had been cured; and they departed in dudgeon, as if a deception had been played upon them, instead of pausing to admire the artistic beauty of the model. Notwithstanding the adverse remarks of the general public, which were exclusively levelled at a mistaken mode of treatment, critics recognized in this colossal figure a work of high genius and of great merit.

In 1851 Mr. Park was elected an associate of the Royal Scottish Academy of Painting, Sculpture, and Architecture, and was subsequently chosen an Academician. His death was sudden and tragic. He had gone from Manchester, where he now resided, to Warrington, where he was employed upon the bust of a gentleman who had given him a sitting, and was returning to the railway station at Warrington, when he perceived a porter endeavouring to carry a trunk that was too heavy for him. Park hurried forward to assist him; but in attempting to raise the load he overtasked his strength, and burst a blood-vessel, by which his death was occasioned almost instantaneously. This melancholy event occurred on the 16th of August, 1855, and his worth and talents were thus recorded in the annual report of that year by the Royal Scottish Academy:—

“A vacancy has occurred in the list of academicians by the premature and lamented death of their highly talented brother academician Patric Park, Esq., sculptor, an event which occurred suddenly at Warrington on the 16th of August last. Mr. Park had at the time of his decease only attained the age of forty-four years; and being an enthusiastic student and lover of his profession, his works, especially his portrait-busts—long distinguished by some of the highest qualities of his noble art—seemed every succeeding year to gain in strength and refinement, so that had life been spared many works of still higher excellence might have been looked for from his prolific studio. The Academy exhibitions for a long series of years past, and none of them more strikingly than that of 1855, when his fine bust of the Emperor of the French occupied a place of honour, sufficiently attest the justice of this brief eulogium of the council, and justify their sorrow that, in the death of Patric Park, the Academy has lost one of its most talented members, and the department of sculpture in which he more peculiarly excelled one of its most eminent professors.”

Mr. Park, as already noticed, was married; his wife was daughter of Robert Carruthers, Esq., Inverness, by whom he had four sons and a daughter.

PATERSON, WILLIAM, the original projector of the Bank of England and of Scotland, and of the celebrated settlement of Darien, was born, it is supposed, in the year 1655, at Skipmyre, in the parish of Tinwald, Dumfriesshire. It is deeply to be regretted that no satisfactory memorials have been preserved of this remarkable man. Of his education nothing is known, but it is stated in one memoir that he was bred to the church. That Mr. Paterson was either a churchman or a buccaneer at any period of his life appears a gratuitous assumption, un-
sup-

sure of Mr. Park's company at dinner on Tuesday next, at half-past five o'clock. An answer is requested.

“Strand, 9th Nov. 1804.”

These were the only written documents belonging to Park which the Messrs. Landers, after the most anxious inquiries and investigations, were able to discover. They succeeded, however, in recovering his double-barrelled gun, and the tabor, or short cloak, which he wore when he was drowned.

ported by any direct evidence, and at variance with the known course of his after-life. It is certain that he was in the West Indies, but it is much more likely that his pursuits there were commercial than either clerical or piratical. In whatever capacity he may have acquired his commercial and geographical knowledge, he returned to Europe with a scheme of trade which he was desirous of establishing under the protection and patronage of some European power. Paterson, himself a merchant, formed an intimate connection with other merchants of London, and with them concerted the establishment of the Bank of England, which he originated and planned. He was admitted one of the original directors, but jealousies arose, and he voluntarily withdrew, by selling out his qualification of £2000 stock. Under these circumstances, having already, before the revolution of 1688, become acquainted in Holland with some of his countrymen, particularly with Fletcher of Saltoun, who had penetration enough to see and to appreciate the simple splendour of his project with regard to Darien, he accordingly came to Scotland along with Fletcher, who introduced him to the various members of the Scottish administration. The Earl of Stair, in particular, gave the project of Mr. Paterson the support of his powerful eloquence.

The result of all this was, that an act was passed by the Scottish parliament on the 26th of June, 1695, "constituting John Lord Belhaven, WILLIAM PATERSON, Esq., and others in Scotland and in London, a free incorporation, by the name of the Company of Scotland trading to Africa and the Indies, providing that of the fund or capital half should be allowed to Scotland." The company was invested with full powers to hold parliaments and make laws, and administer justice, &c., in any colonies they might plant in Asia, Africa, and America. This act was drawn up under the eye of Mr. Paterson, and was certainly highly favourable for his purposes. The Isthmus of Darien, where there was a large tract of land bordering on both seas, the Indian and the Atlantic, was the spot he had fixed upon for the scene of his operations, and the advantages of which he thus graphically pointed out: "The time and expense of navigation to China, Japan, the Spice Islands, and the far greater part of the East Indies, will be lessened more than half, and the consumption of European commodities and manufactures will soon be more than doubled. Trade will increase, and money will beget money, and the trading world shall need no more want work for their hands, but will rather want hands for their work. Thus this door of the seas and key of the universe, with anything of a reasonable management, will of course enable its proprietors to give laws to both oceans, without being liable to the fatigues, expenses, and dangers, or contracting the guilt and blood, of Alexander and Cæsar. In all our empires that have been anything universal, the conquerors have been obliged to seek out and court their conquests from afar; but the universal force and influence of this attractive magnet is such as can much more effectually bring empire home to the proprietors' doors. But from what hath been said, you may easily perceive that the nature of these discoveries are such as not to be engrossed by any one nation or people with exclusion to others; nor can it be thus attempted without evident hazard and ruin, as we may see in the case of Spain and Portugal, who, by their prohibiting any other people to trade, or so much as to go to or dwell in the Indies, have not only lost that trade they were not able to maintain, but have depopulated and ruined their countries therewith, so that the Indies have rather conquered Spain and Por-

tugal than they have conquered the Indies; for by their permitting all to go out and none to come in, they have not only lost the people which are gone to the remote and luxuriant regions, but such as remain are become wholly unprofitable and good for nothing. Thus, not unlike the case of the dog in the fable, they have lost their own countries, and not gotten the Indies. People and their industry are the true riches of a prince or nation, and in respect to them all other things are but imaginary. This was well understood by the people of Rome, who, contrary to the maxims of Sparta and Spain, by general naturalizations, liberty of conscience, and immunities of government, far more effectually and advantageously conquered and kept the world than ever they did or possibly could have done by the sword." Seeing clearly his way, Mr. Paterson seems not to have had the smallest suspicion but that others would see it also, and "he makes no doubt but that the affection we owe to our sister nation will incline the company to be zealous in using all becoming endeavours for bringing our fellow-subjects to be jointly concerned in this great, extensive, and advantageous undertaking. That a proposal of this kind from the company will be other than acceptable ought not to be supposed, since by this means the consumption and demand of English manufactures, and consequently the employment of their people, will soon be more than doubled. England will be hereby enabled to become the long-desired seaport, and yet its public revenues, instead of being diminished, will thereby be greatly increased. By this their nation will at once be eased of its laws of restraint and prohibitions, which, instead of being encouragements, always have, and still continue to be, the greatest lets to its trade and happiness." These liberal views seem to have made a greater impression on the public mind than at that time could have been anticipated. In the month of October, 1695, Lord Belhaven, Mr. Robert Blackwood, and Mr. James Balfour went on a deputation to London, accompanied by Mr. Paterson, where the subscription-books were first opened, and in the course of nine days £300,000 were subscribed; one-fourth of all subscriptions being paid in cash. This promising state of things, however, was, by the jealousy of the English monopolists, suddenly reversed. The East India Company were the first to take the alarm, and they communicated their terrors to the House of Commons. The latter requested a conference with the lords on the alarming circumstance, and a committee was appointed to inquire by what methods such an act had been obtained, who were the promoters, and who had become subscribers to the company. This was followed by an address to the king from both houses of parliament, stating, "That by reason of the superior advantages granted to the Scottish East India Company, and the duties imposed upon the Indian trade in England, a great part of the stock and shipping of this nation would be carried thither, by which means Scotland would be rendered a free port, and Europe from thence supplied with the products of the East much cheaper than through them, and thus a great article in the balance of foreign commerce would be lost to England, to the prejudice of the national navigation and the royal revenue." The address went on to state, "that when the Scots should have established themselves in plantations in America, the western branch of traffic would also be lost. The privileges granted their company would render their country the general storehouse for tobacco, sugar, cotton, hides, and timber; the low rates at which they would be enabled to carry on their manufactures would render it impossible for

the English to compete with them; while, in addition, his majesty stood engaged to protect, by the naval strength of England, a company whose success was incompatible with its existence." This address his majesty received graciously, observing "that he had been ill-served in Scotland, but he hoped some remedy might yet be found to prevent the inconvenience that might arise from the act." To satisfy his English parliament that he was in earnest, William dismissed his Scottish ministers, and among the rest the Earl of Stair.

The English parliament, with a spirit worthy of the darkest ages and the most barbarous nations, proceeded to declare Lord Belhaven, William Paterson, and twenty-two other members of the company, guilty of a high misdemeanour. Those of their own people who had become partners in the company were compelled to withdraw their subscriptions. Upwards of £200,000 sterling were afterwards subscribed to the scheme by the merchants of Holland and Hamburg, and the English resident at the latter city, Sir Paul Rycault, was instructed to present a remonstrance on the part of the king to the magistrates, complaining of the countenance they had given to the commissioners of the Darien Company. The answer of the city was worthy of itself in its best days. "They considered it strange that the King of England should dictate to them, a free people, how, or with whom, they were to engage in the arrangements of commerce, and still more so, that they should be blamed for offering to connect themselves in this way with a body of his own subjects incorporated under a special act of parliament." From this interference, however, the Hamburgers, aware that the company was to be thwarted in all its proceedings by the superior power of England, lost confidence in the scheme, and finally withdrew their subscriptions. The Dutch, too, equally jealous of commercial rivalry with the English, and influenced perhaps by the same motives with the Hamburgers, withdrew their subscriptions also, and the company was left to the unassisted resources of their own poor and depressed country. But nothing could exceed the eagerness with which all classes of the Scottish people hastened to enrol themselves in the magnificent copartnery now forming. Every burgh, every city, and almost every family of any consequence became shareholders. Four hundred thousand pounds were subscribed—an astonishing sum when it is known that at that time the circulating capital of the kingdom did not exceed £800,000 sterling. To this enthusiasm a variety of causes contributed. The scheme of Paterson was politically good. It was drawn up with great ability, and promised important results in a moral and religious as well as in a commercial point of view. Many of the subscribers, indeed, were influenced solely by religious motives, as they considered the setting up of a church regularly constituted on that continent the most likely means for spreading the gospel among the natives, and as affording facilities for that purpose which could not in any other way be obtained. But it must also be admitted that the scheme, having become a national mania, was not left to work its way by its own intrinsic merits. The scene of the intended operations became the subject of numberless pamphlets, wherein fancy was much more largely employed than fact. The soil was represented as rich, and teeming with the most luxuriant fertility; the rivers as full of fish, and their sands sparkling with gold; the woods smiling in perpetual verdure, at all times ringing with the melody of spring, and loading every breeze that swept over them with the most delightful odours.

Having completed their preparations, and the public authorities having assured them of protection and encouragement, the colony, in presence of the whole city of Edinburgh, which poured out its inhabitants to witness the scene, embarked at Leith, from the roads of which they sailed on the 26th of July, 1698. The fleet consisted of five ships purchased at Hamburg or Holland—for they were refused even the trifling accommodation of a ship of war which was laid up at Burntisland—and were named the *Caledonia*, *St. Andrew*, *Unicorn*, *Dolphin*, and *Endeavour*; the two last being yachts laden with provisions and military stores. The colony consisted of 1200 men, 300 of them being young men of the best Scottish families. Among them were also sixty officers, who had been thrown out of employment by the peace which had just been concluded, and who carried along with them the troops they had commanded; all of whom were men who had been raised on their own estates or on those of their relations. Many soldiers and sailors whose services had been refused—for many more than could be employed had offered themselves—were found hid in the ships, and when ordered ashore clung to the ropes, imploring to be allowed to go with their countrymen without fee or reward. The whole sailed amidst the praises, the prayers, and the tears of relations, friends, and countrymen; "and neighbouring nations," says Dalrymple, "saw with a mixture of surprise and respect the poorest nation of Europe sending forth the most gallant colony which had ever gone from the old to the new world." The parliament of Scotland met in the same week that the expedition for Darien sailed, and on the 5th of August they presented a unanimous address to the king, requesting that he would be pleased to support the company. The lord-president, Sir Hugh Dalrymple, and Sir James Stuart, lord-advocate, also drew out memorials to the king in behalf of the company, in which they proved their rights to be irrefragable, on the principles both of constitutional and public law. All this, however, did not prevent orders being sent out by the English ministry to all the English governors in America and the West Indies, to withhold all supplies from the Scottish colony at Darien, and to have no manner of communication with it, either in one shape or another. Meanwhile, the colony proceeded on its voyage without anything remarkable occurring; and on the 3d of November landed between Portobello and Carthage, at a place called Acta, where there was an excellent harbour, about four miles from Golden Island. Having obtained the sanction of the natives to settle among them, they proceeded to cut through a peninsula, by which they obtained what they conceived to be a favourable site for a city, and they accordingly began to build one, under the name of New Edinburgh. They also constructed a fort in a commanding situation, for the protection of the town and the harbour, which they named St. Andrew; and on the country itself they imposed the name of Caledonia. The first care of the council which had been appointed by the company, but of which Mr. Paterson was unfortunately not a member, was to establish a friendly correspondence with the native chiefs, which they found no difficulty in doing. To the Spanish authorities at Carthage and Panama they also sent friendly deputations, stating their desire to live with them upon terms of amity and reciprocal intercourse. On the 28th of December, 1698, the council issued a proclamation, dated at New Edinburgh, to the following effect:—"We do hereby publish and declare, That all manner of persons, of what nation or people soever, are and shall

from henceforward be equally free, and alike capable of the said properties, privileges, protections, immunities, and rights of government, granted unto us; and the merchants and merchant ships of all nations may freely come to and trade with us without being liable in their persons or goods to any manner of capture, confiscation, seizure, forfeiture, attachment, arrest, restraint, or prohibition for or by reason of any embargo, breach of the peace, letters of marque or reprisals, declaration of war with any foreign prince, potentate, or state, or upon any other account or pretence whatsoever. And we do hereby not only grant, concede, and declare a general and equal freedom of government and trade to those of all nations who shall hereafter be of or concerned with us, but also a full and free liberty of conscience in matters of religion, so as the same be not understood to allow, connive at, or indulge the blaspheming of God's holy name, or any of his divine attributes, or of the unhallowing or profaning the Sabbath-day; and, finally, as the best and surest means to render any government successful, durable, and happy, it shall, by the help of Almighty God, be ever our constant and chiefest care, that all our further constitutions, laws, and ordinances be consonant and agreeable to the Holy Scriptures, right reason, and the examples of the wisest and justest nations; that from the righteousness thereof we may reasonably hope for and expect the blessings of prosperity and increase." So far all was well, but the want of a leading spirit, of one who could overawe the refractory, and of summary laws for their punishment, soon began to be felt; Mr. Paterson, before sailing, had been refused a position, and the event showed the grossness of that error. In the original articles of the company it had been agreed that he should be allowed two per cent. on the stock, and three per cent. on the profits, but he had given up both these claims long before leaving Scotland. "It was not," he said, "suspicion of the justice or gratitude of the company, nor a consciousness that his services could ever become useless to them, but the ingratitude of some individuals experienced in life, which made it a matter of common prudence in him to ask a retribution for six years of his time, and £10,000 spent in promoting the establishment of the company. But now," he continues, "that I see it standing upon the authority of parliament, and supported by so many great and good men, I release all claim to that retribution; happy in the noble concession made to me, but happier in the return which I now make for it." The whole management was vested in a council of seven, under regulations, the fifth of which ran thus—"That after their landing and settlement as aforesaid, they, the council, shall class and divide the whole freemen inhabitants of the said colony into districts, each district to contain at least fifty and not exceeding sixty freemen inhabitants, who shall elect yearly any one freeman inhabitant whom they shall think fit to represent them in a parliament or council-general of the said colony, which parliament shall be called or adjourned by the said council as they see cause; and being so constitute, may, with consent of the said council, make and enact such rules, ordinances, and constitutions, and impose such taxes, as they think fit and needful for the good of the establishment, improvement, and support of the said colony; providing always, that they lay no further duties or impositions of trade than what is after stated." One of the councillors, writing at this time to the directors at home, says, "We found the inconvenience of calling a parliament, and of telling the inhabitants that they were freemen so soon. They had not the true notion

of liberty. The thoughts of it made them insolent, and ruined command. You know that it's expressly in the 'Encouragements,' that they are to serve for three years, and at the three years' end to have a division of land." It was the opinion of this director that no parliament should have been called till at least the three years of servitude had expired. Even then, from the characters of the settlers, who had not been selected with that care which an experiment of such vast consequence demanded, there might have existed causes for delaying the escape. Among the better class, there were too many young men of birth. These were inexperienced and wholly unfit for exercising authority, and equally ill adapted for submitting to it. Among the lower class were many who had been opposed to the Revolution, and who had resorted to the colony purely from dissatisfaction with the government at home. These, instead of submitting with patience to the privations and labour necessary in that state of society in which they were now placed, would gladly have laid aside the mattock and the axe, and have employed themselves in plundering incursions upon the Indians or the Spaniards. The subscribers to the scheme were so numerous, that the idle, the unprincipled, and profligate had found but too little difficulty in attaching themselves to the infant colony. Those who were nominated to the council, too, had been selected without judgment. "There was not," Paterson writes in a letter to Mr. Shields, "one of the old council fitted for government, and things were gone too far before the new took place."

The colony was first established at the beginning of winter, the best season for Europeans first encountering the climate of Darien; and the first letter from the council to the directors thus expresses the satisfaction of the colonists with their new destination:—"As to the country, we find it very healthful; for though we arrived here in the rainy season, from which we had little or no shelter for several weeks together, and many sick among us, yet we are so far recovered, and in so good a state of health, as could hardly anywhere be expected among such a number of men together. In fruitfulness this country seems not to give place to any in the world; for we have seen several of the fruits, as cocoa-nuts, barillas, sugar-canes, maize, oranges, &c. &c., all of them, in their kinds, the best anywhere to be found. Nay, there is hardly a foot of ground but may be cultivated; for even upon the very tops and sides of the hills there is commonly three or four feet deep of rich earth, without so much as a stone to be found therein. Here is good hunting and fowling, and excellent fishing in the bays and creeks of the coast; so that, could we improve the season of the year just now begun, we should soon be able to subsist of ourselves; but building and fortifying will lose us a whole year's planting." This was, however, no more than all of them must have foreseen; and they never doubted of obtaining more provisions than they could want from the West India islands or from the American colonies. Orders, however, as has already been noticed, were sent out after them to all the English governors, prohibiting all communication with them. These proclamations were rigidly adhered to, and the unfortunate Scottish colonists were denied those supplies which had seldom been withheld from lawless smugglers, buccaneers, and pirates. In addition to this, which was the principal source of all their misfortunes, those who superintended the equipment of the expedition had, through carelessness or design, furnished them with provisions, part of which were uneatable; the consequence of which was, that the colony had to be put

on short allowance when the sickly season was thinning their numbers, and bringing additional duty on those who were in health. In this emergency their Indian friends exerted themselves on their behalf, putting to shame their Christian brethren, who, from a mean jealousy, were attempting to starve them; and they might still have done better, had not insubordination broken out among themselves, and a conspiracy been formed, in which some of the council were implicated, to seize one of the vessels and to make their escape from the colony. After matters had come this length, Paterson and others became councillors—a measure which had the effect of checking the turbulence of the discontented. The new council also despatched one of their own number to Britain, with an address to the king, and a pressing request to send them out supplies of provisions, ammunition, and men. On receiving this despatch the directors lost no time in sending out the requisite supplies. They had already sent despatches and provisions by a brig, which sailed from the Clyde in the end of February, 1699, but which unhappily never reached her destination. On the arrival in Britain of another of their number Mr. Hamilton, who was accountant-general to the colony, and whose absence was highly detrimental to its interests, the *Olive Branch*, Captain Jamieson, and another vessel, with 300 recruits and store of provisions, arms, and ammunition, were despatched from Leith Roads on the 12th of May, 1699. Matters in the colony were in the meantime getting worse; and on the 22d of June they came to the resolution of abandoning the place within eight months of the time they had taken possession of it. The projector himself resisted this measure manfully. He, however, fell ill in mind and body, but recovered the full powers of his mind at New York, whence he returned to Scotland to make his report to the company, and give them his best advice regarding the further prosecution of their undertaking. Two of their captains, Samuel Veitch and Thomas Drummond, remained at New York. The *Olive Branch*, the vessel alluded to as having gone out to the colony with recruits and provisions, was followed by a fleet of four ships, the *Rising Sun*, *Hope*, *Duke Hamilton*, and *Hope of Borrowstonness*, with 1390 men. These ships all sailed from the Kyles of Bute, on the 24th of September, 1699, and reached Caledonia Bay on the 30th of November following. With this fleet went out William Veitch, son of the Rev. William Veitch of Dumfries, and brother to Samuel already mentioned. Individuals were also sent out by various conveyances, with bills of credit for the use of the colony. Everything now, however, went against them. The *Olive Branch* and her consort having arrived in the harbour of New Edinburgh, the recruits determined to land and repossess themselves of the place, the huts of which they found burned down and totally deserted. One of their ships, however, took fire and was burned in the harbour, on which the others set sail for Jamaica. When the fleet which followed arrived in November, and, instead of a colony ready to receive them, found the huts burned down, the fort dismantled, and the ground which had been cleared overgrown with shrubs and weeds, with all the tools and implements of husbandry taken away, they were at a loss what to do. A general cry was raised in the ships to be conducted home, which was encouraged by Mr. James Byers, one of the new councillors, who seems to have been himself deeply impressed with that dejection of spirit which, as a councillor, it was his duty to suppress. Veitch, however, assisted by Captain Thomas Drummond, who had come out in the *Olive Branch*, and had

taken up his residence among the natives till the fleet which he expected should arrive, succeeded in persuading the men to land. As the Spaniards had already shown their hostility, and having been defeated by a detachment of the colonists in the preceding February, were preparing for another attack—encouraged, no doubt, by the treatment which the colony had met with from the English government—Drummond proposed an immediate attack on Portobello, which they could easily have reduced, and where they might have been supplied with such things as they were most in want of. In this he was cordially seconded by Veitch, but was prevented by the timidity of his colleagues and the intrigues of Byers, who at length succeeded in ejecting him from the council. Two ministers, Messrs. James and Scott, went out with the first expedition, but the one died on the passage, and the other shortly after landing in New Caledonia. The council having written home to the directors regretting the death of their ministers, and begging that others might be sent to supply their place, the commission of the General Assembly of the Church of Scotland, at the particular desire of the board of directors, sent out the Rev. Messrs. Alexander Shields (the well-known author of the *Hind let Loose*, *Life of Renwick*, &c.), Borland, Stobo, and Dalgleish. These persons sailed in the last fleet. They were instructed on their arrival, with the advice and concurrence of the government, to set apart a day for solemn thanksgiving, to form themselves into a presbytery, to ordain elders and deacons, and to divide the colony into parishes, that thus each minister might have a particular charge. After which it was recommended to them, “so soon as they should find the colony in case for it, to assemble the whole Christian inhabitants, and keep a day together for solemn prayer and fasting, and with the greatest solemnity and seriousness to avouch the Lord to be their God, and dedicate themselves and the land to the Lord.” The Church of Scotland took so deep an interest in the colony of Darien, that the commission sent a particular admonition by the ministers, of which the following may be taken as a specimen:—“We shall, in the next place, particularly address ourselves to you that are in military charge, and have command over the soldiery, whether by land or sea. It is on you, honoured and worthy gentlemen, that a great share of the burden of the public safety lies. You are, in some respects, both the hands and the eyes of this infant colony. Many of you have lately been engaged in a just and glorious war, for retrieving and defending the Protestant religion, the liberties and rights of your country, under the conduct of a matchless prince. And now when, through the blessing of the Lord of hosts, his and your arms have procured an honourable peace at home, you, and others with you, have, with much bravery, embarked yourselves in a great, generous, and just undertaking, in the remote parts of the earth, for advancing the honour and interest of your native country. If in this you acquit yourselves like men and Christians, your fame will be renowned both abroad and at home.” The ministers found the colony in circumstances very different from what the address of the commission naturally supposed; and it was but few of their instructions they were able to carry into effect. Two of them, however, preached on land, and one on board the *Rising Sun*, every Sabbath-day. But in addition to the unfavourable aspect of their affairs, the irreligion and licentiousness of the colonists oppressed their spirits and paralyzed their efforts. With the view of forming an acquaintance with the natives, they undertook a

journey into the interior, accompanied by a Lieutenant Turnbull, who had some slight knowledge of the Indian language. They spent several nights in the cabins of the natives, by whom they were received with great kindness; and on their return brought back to the colonists the first notice of the approach of the Spaniards. When apprised of all the circumstances, the directors felt highly indignant at the conduct of those who, upon such slight grounds, had left the settlement desolate; and whose glory, they said, it ought to have been to have perished there, rather than to have abandoned it so shamefully. In their letters to their new councillors and officers they implored them to keep the example of their predecessors before their eyes as a beacon, and to avoid those ruinous dissensions and shameful vices on which they had wrecked so hopeful an enterprise. "It is a lasting disgrace," they add, "to the memories of those officers who went in the first expedition, that even the meanest planters were scandalized at the licentiousness of their lives, many of them living very intemperately and viciously for many months at the public charge, whilst the sober and industrious among them were vigilant in doing their duty. Nor can we, upon serious reflection, wonder if an enterprise of this nature has misgiven in the hands of such as, we have too much reason to believe, neither feared God nor regarded man." They also blamed the old council heavily for deserting the place *without ever calling a parliament* or general meeting of the colony, or in any way consulting their inclinations, but commanding them to a blind and implicit obedience, which is more than they ever can be answerable for. "Wherefore," they continue, "we desire you would constitute a parliament, whose advice you are to take in all important matters. And in the meantime you are to acquaint the officers and planters with the constitutions, and the few additional ones sent with Mr. Mackay, that all and every person in the colony may know their duty, advantages, and privileges." Alarmed by the accounts which they soon after received from Darien, the council-general of the company despatched a proclamation, declaring "that it shall be lawful to any person, of whatever degree, inhabiting the colony, not only to protest against, but to disobey and oppose, any resolution to desert the colony;" and, "that it shall be death, either publicly or privately, to move, deliberate, or reason upon any such desertion or surrender, without special order from the council-general for that effect. And they order and require the council of Caledonia to proclaim this solemnly, as they shall be answerable." Before this act was passed in Edinburgh, however, New Caledonia was once more evacuated. The men had set busily to the rebuilding the huts and repairing the fort; but strenuous efforts were still made in the council to discourage them, by those who wished to evacuate the settlement. Veitch was with difficulty allowed to protest against some of their resolutions; and for opposing them with warmth Captain Drummond was laid under arrest. Speaking of Drummond, Mr. Shields says, "Under God, it is owing to him and the prudence of Captain Veitch that we have stayed here so long, which was no small difficulty to accomplish." And again, "If we had not met with Drummond at our arrival, we had never settled in this place, Byers and Lindsay being averse from it, and designing to discourage it from the very first; Gibson being indifferent if he got his pipe and dram; only Veitch remained resolved to promote it, who was all along Drummond's friend, and concurred with his proposal to send men against the Spaniards at first, and took the patronizing as

long as he could conveniently, but with such caution and prudence, as to avoid and prevent animosity and faction, which he saw were unavoidable, threatening the speedier dissolution of this interest, if he should insist on the prosecution of that plea, and in opposition to that spate that was running against Drummond. But now Finab coming, who was Drummond's comrade and fellow-officer in Lorn's regiment in Flanders, he is set at liberty." This was the son of Colonel Campbell of Finab, who, with 300 of his own men, had come out and joined this last party about two months after their arrival. The Spanish troops meantime, from Panama and Santa Maria, conducted through the woods by negroes, were approaching them. They had advanced, to the number of 1600 men, as far as Tubucantee, in the immediate neighbourhood of the colony, when Finab marched against them with 200 men, and defeated them in a slight skirmish, in which he was wounded. The victory, which at one time would have been of signal service to the colony, was now unavailing; a fleet of eleven ships, under the command of the governor of Carthage, Don Juan Pimentia, having blocked up the harbour and landed a number of troops, who, advancing along with the party which had found their way through the woods, invested the fort. Cut off from water, reduced by sickness, and otherwise dispirited, the garrison was loud in its demands for a capitulation, and the council had no other alternative but to comply with it. Finab being laid up at the time with a fever, Veitch conducted the treaty, and was allowed honourable terms. The inhabitants of the colony having gone on shipboard with all that belonged to them, they weighed anchor on the 11th of April, 1700, and sailed for Jamaica, after having occupied New Caledonia somewhat more than four months. The *Hope*, on board of which was Captain Veitch and the greater part of the property, was wrecked on the rocks of Colorades, on the western coast of Cuba. Veitch, however, was dead before this accident happened. The *Rising Sun* was wrecked on the bar of Carolina, and the captain and crew, with the exception of sixteen persons who had previously landed, were lost. Of the few survivors, some remained in the English settlements, some died in Spanish prisons; and of the 3000 men that at different periods went out to the settlement, perhaps not above twenty ever regained their native land.

In this melancholy manner terminated the greatest attempt at colonization ever made by Scotland. The conception was splendid, the promise great and every way worthy of the experiment; and but for the jealousy of the English and the Dutch, more particularly the former, it must have succeeded. The settlers, indeed, were not all well selected; the measures actually pursued fatal to success; and above all, the council were men of feeble minds, utterly unqualified to act in a situation of such difficulty as that in which they came to be placed. Had the wants of the Scottish settlers been supplied by the English colonies, which they could very well have been even with advantage to the colonies, the first and most fatal disunion and abandonment of their station could not have happened; and had they been acknowledged by their sovereign, the attack made upon them by the Spaniards, which put an end to the colony, would never have been made. Time would have smoothed down the asperities among the settlers themselves; experience would have corrected their errors in legislation; and New Caledonia might have become the emporium of half the commerce of the world.

Mr. Paterson, not disheartened by the failure of

his Darien project, instead of repining, revived the scheme in a form to induce England, whose hostility had hitherto thwarted all his measures, to share in the undertaking, and he succeeded; when the sudden death of King William stopped the design, and Queen Anne's ministers, who approved of it, had no vigour to carry it out.

Mr. Paterson died at an advanced age, in poor circumstances. After the union, he claimed upon the Equivalent Money for the losses he had sustained at Darien, and in 1715 obtained his indemnity. Had Paterson's scheme succeeded—and it was no fault of his that it did not—his name had unquestionably been enrolled among the most illustrious benefactors of his species; and if we examine his character in the light of true philosophy, we shall find it greatly heightened by his failure. We never hear from him a single murmur. When disappointed or defeated, he did not give way to despair, but set himself coolly and calmly to another and still greater undertaking. When this failed, through the injustice of those who ought to have been his protectors and the imbecility of those whom he ought to have commanded, he only sought to improve his plan. There is one part of his character which, in a man of so much genius, ought not to pass unnoticed: "he was void of passion; and he was one of the very few of his countrymen who never drank wine."

PATRICK, SAINT, the celebrated apostle of Ireland, was born near the town of Dumbarton, in the west of Scotland, about the year 372 of the Christian era. His father, whose name was Calpurnius, was in a respectable station in life, being municipal magistrate in the town in which he lived. What town this was, however, is not certainly known, whether Kilpatrick, a small village on the Clyde five miles east of Dumbarton; Duntocher, another small village about a mile north of Kilpatrick; or Dumbarton itself. One of the three, however, it is presumed it must have been, as it is described as being situated in the north-west part of the Roman province; but though various biographers of the saint have assigned each of these towns by turns as his birthplace, conjecture has decided in favour of Kilpatrick. His father is supposed (for nearly all that is recorded of the holy man is conjectural, or at best but inferential) to have come to Scotland in a civil capacity with the Roman troops under Theodosius. His mother, whose name was Cenevessa, was sister or niece of St. Martin, Bishop of Tours; and from this circumstance it is presumed that his family were Christians.

The original name of St. Patrick was Succat or Succach, supposed to have some relation to Succoth, the name at this day of an estate not far distant from his birthplace, the property of the late Sir Ilay Campbell. The name of Patricius, or Patrick, was not assumed by the saint until he became invested with the clerical character.

In his sixteenth year, up to which time he had remained with his father, he was taken prisoner, along with his two sisters, on the occasion of an incursion of the Irish, and carried over a captive to Ireland. Here he was reduced to a state of slavery, in which he remained for six or seven years with Milcho, a petty king in the northern part of that country. The particular locality is said to be Skerry, in the county of Antrim. At the end of this period he effected his escape; on which occasion, it is recorded, he had warning that a ship was ready for him, although she lay at a distance of 200 miles, and in a part of the country where he never had been, and where he was unacquainted with any one. On making his escape

he proceeded with the vessel to France, and repaired to his uncle at Tours, who made him a canon regular of his church. St. Patrick had already entertained the idea of converting the Irish, a design which first occurred to him during his slavery, and he now seriously and assiduously prepared himself for this important duty. But so impressed was he with the difficulty and importance of the undertaking, and the extent of the qualifications necessary to fit him for its accomplishment, that he did not adventure on it until he had attained his sixtieth year, employing the whole of this long interval in travelling from place to place, in quest of religious instruction and information. During this period he studied also for some time under St. Germanus, Bishop of Gaul. By this ecclesiastic he was sent to Rome with recommendations to Pope Celestine, who conferred upon him ordination as a bishop, and furnished him with instructions and authority to proceed to Ireland to convert its natives. On this mission he set out in the year 432, about the time that a similar attempt by Palladius had been made, and abandoned as hopeless. St. Patrick was, on this occasion, accompanied by a train of upwards of twenty persons, among whom was Germanus. He sailed for Ireland from Wales, having come first to Britain from France, and attempted to land at Wicklow, but being here opposed by the natives, he proceeded along the coast till he came to Ulster, where, meeting with a more favourable reception, he and his followers disembarked. He soon afterwards obtained a gift of some land, and founded a monastery and a church at Downe or Downpatrick. From this establishment he gradually extended his ministry to other parts of Ireland, devoting an equal portion of time to its three provinces, Ulster, Munster, and Connaught, in each of which he is said to have resided seven years, making altogether a period of one and twenty. During this time he paid frequent visits to the Western Isles, with the view of disseminating there the doctrines which he taught. Being now far advanced in years, he resigned his ecclesiastical duties in Ireland, and returned to his native country, where he died. The place, however, at which this event occurred, the year in which it occurred, the age which he attained, and the original place of his interment, have all been disputed, and differently stated by different authors. The most probable account is, that he died and was buried at Kilpatrick—this, indeed, appears all but certain from many circumstances, not the least remarkably corroborative of which is, the name of the place itself, which signifies, the word being a Gaelic compound, the burial-place of Patrick—that he died about the year 458; and that he was about eighty-six years of age when this event took place.

PENNECUIK, ALEXANDER, M.D., author of a *Description of the County of Tweeddale*, and of various poems, was born in 1652, being the eldest son of Alexander Pennecuik, of Newhall, county of Edinburgh, who had served as a surgeon, first to General Bannier in the Thirty Years' war, and afterwards in the army sent by the Scots into England in 1644, in terms of the Solemn League and Covenant. The latter individual sold, in 1647, the original property of his family to the ancestor of the Clerks, baronets, who have since possessed it, and purchased, instead, the smaller adjacent estate of Newhall, to which he afterwards added by marriage that of Romanno in Peeblesshire. The subject of the present memoir, after being educated to the medical profession, and travelling, as would appear, on the Continent, settled at no advanced period of life on these patri-

monial estates, where for some years he devoted himself with warm filial affection to the care of his aged parent. The elder gentleman died at an advanced age, after having seen five Kings of Scotland, and been contemporaneous with four revolutions in the state religion; which would seem to indicate that he survived the year 1692, the date of the last establishment of Presbytery. The subject of this memoir then succeeded to the possession of Newhall and Romanno, continuing, however, to practise as a physician, in which profession he seems to have enjoyed a high reputation. Dr. Pennecuik was one of a small knot of Scottish gentlemen who cultivated letters and science at a time of comparative darkness in this country—the latter end of the seventeenth and beginning of the eighteenth centuries. His literary efforts were chiefly confined to facetious poetry, for which he seems to have found models in Butler and Dryden, and in the homely strains of the native muse. His poems refer mostly to local characters and affairs, and are now only to be valued for the vestiges of contemporary manners which are to be traced in them, but which are not always remarkable for their good taste and purity. The presbytery meetings of a Moderate district, with their convivial accompaniments, occasionally provoked the satire of his pen. The following are almost the only verses deserving to be remembered:—

INSCRIPTION FOR MY CLOSET.

Are not the ravens fed, great God, by thee?
And wilt thou clothe the lilies and not me?
I'll ne'er distrust my God for clothes nor bread,
Whilst lilies flourish, and the raven's fed.

Dr. Pennecuik has less credit for his poetry than for his devotion to botanical pursuits, as science was then even more rare than literature. For this study he enjoyed some advantages in the peripatetic nature of his life as a country physician, and in a correspondence which he carried on with Mr. James Sutherland, the superintendent of the first botanic garden in Edinburgh. In 1715 he was induced to give the result of his literary and scientific labours to the world, in a small quarto volume, containing a description of Tweeddale and his miscellaneous poems; the botany of the county being a prominent department of the volume. About a century afterwards this production was reprinted by the late Mr. Constable. Dr. Pennecuik is not only meritorious as himself a cultivator of letters, but as an encourager of the same pursuits in others. He was one of the literary gentlemen to whom Ramsay so frequently expresses his obligations, and not improbably communicated the incidents upon which that poet founded his *Gentle Shepherd*, the scene of which pastoral is, almost beyond question, the estate of Newhall, which, however, through the extravagance of a son-in-law of Dr. Pennecuik, had then passed into a different family. The subject of this memoir died in 1722.

Another writer of Scottish verses named ALEXANDER PENNECUIK flourished in the earlier part of the eighteenth century. He was a burgher of Edinburgh; the author of *Streams from Helicon*, published in 1720, and *Flowers from Parnassus*, in 1726. He wrote also a historical account of the *Blue Blanket*, or *Craftsman's Banner*; and shortly before his death commenced a periodical under the title of *Entertainment for the Curious*. In his verses he imitated Allan Ramsay. Several of his poems display considerable talent for humour. His life was dissipated and his death miserable.

PERRY, JAMES, an eminent journalist, was born in Aberdeen, on the 30th of October, 1756. He

received the rudiments of his education at the school of Garioch, and was afterwards removed to the high-school of Aberdeen. Having gone through the usual course of learning at this seminary with much credit to himself and satisfaction to his teachers, he entered Marischal College in 1771, and was afterwards, on completing his curriculum at the university, placed under Dr. Arthur Dingwall Fordyce, to qualify him for the profession of the law, a profession to which he originally intended to devote himself. The misfortunes of his father, however, who was an eminent house-builder in Aberdeen, and who had about this period entered into some ruinous speculations, compelled him suddenly to abandon his legal studies, and to resign all idea of adopting the law as a profession. In these unfortunate circumstances young Perry went to Edinburgh, in 1774, with the humble hope of procuring employment as a clerk in some writer's chambers. Even this, however, he could not obtain; and after hanging about the city for many weeks, making daily but ineffectual efforts to get into a way of earning a subsistence, he came to the resolution of trying his fortune in England. With this view he proceeded to Manchester, where he succeeded in obtaining a situation in the counting-house of a Mr. Dinwiddie, a respectable manufacturer, in which he remained for two years. During his stay in Manchester, Mr. Perry, who was yet only in the nineteenth year of his age, attracted the notice, and procured the friendship and patronage, of several of the principal gentlemen in the town, by the singular talents he displayed in a debating society which they had established for the discussion of moral and philosophical subjects. This favourable opinion of the youthful orator's abilities was still further increased by his producing several literary essays of great merit.

Encouraged by this success Mr. Perry determined to seek a wider field for the exercise of his talents; and with this view set out for London in the beginning of the year 1777, carrying with him a number of letters of introduction and recommendations from his friends in Manchester to influential individuals in the metropolis. For some time, however, these were unavailing. He could find no employment; and he seemed as hopelessly situated now in the English as he had been in the Scottish capital two years before. But the occurrence of a circumstance, not uninteresting in the memoirs of a literary man who fought his way to fame and fortune by the mere force of his talents, at length procured him at once the employment which he sought, and placed him on the path to that eminence which he afterwards attained. While waiting in London for some situation presenting itself, Mr. Perry amused himself by writing fugitive verses and short essays for a journal called the *General Advertiser*. These he dropped into the letter-box of that paper, as the casual contributions of an anonymous correspondent, and they were of such merit as to procure immediate insertion. It happened that one of the parties to whom he had a letter of recommendation, namely, Messrs. Richardson & Urquhart, had a share in the proprietorship of the *Advertiser*, and on these gentlemen Mr. Perry was in the habit of calling daily to inquire whether any situation had yet offered for him. On entering their shop one day to make the usual inquiry, Mr. Perry found Mr. Urquhart earnestly engaged in reading an article in the *Advertiser*, and evidently with great satisfaction. When he had finished, the former put the now almost hopeless question, Whether any situation had yet presented itself? and it was answered in the usual negative; "but," added Mr. Urquhart, "if you could write

such articles as this," pointing to that which he had just been reading, "you would find immediate employment." Mr. Perry glanced at the article which had so strongly attracted the attention of his friend, and discovered that it was one of his own. He instantly communicated the information to Mr. Urquhart; and at the same time pulled from his pocket another article in manuscript, which he had intended to put into the box, as usual, before returning home. Pleased with the discovery Mr. Urquhart immediately said that he would propose him as a stipendiary writer for the paper, at a meeting of the proprietors which was to take place that very evening. The result was that on the next day he was employed at the rate of a guinea a week, with an additional half-guinea for assistance to the *London Evening Post*, printed by the same person.

On receiving these appointments Mr. Perry devoted himself with great assiduity to the discharge of their duties, and made efforts before unknown in the newspaper establishments of London. On the memorable trials of Admirals Keppel and Palliser, he, by his own individual exertions, transmitted daily from Portsmouth eight columns of a report of proceedings taken in court, an achievement which had the effect of adding several thousands to the daily impression of the paper. Even while thus laboriously engaged Mr. Perry wrote and published several political pamphlets and poems on the leading topics of the day, all possessed of much merit, though of only transient interest.

In 1782 Mr. Perry commenced a periodical publication, entitled the *European Magazine*. This work, which was on a plan then new, comprising a miscellany on popular subjects and reviews of new books, appeared monthly, and from the ability with which it was conducted added greatly to the reputation and popularity of its editor. Having conducted this journal for twelve months, Mr. Perry was, at the end of that period, chosen by the proprietors of the *Gazetteer* to be editor of that paper, in which shares were held by some of the principal booksellers in London, at a salary of four guineas per week; but under an express condition, made by himself, that he should be in no way constrained in his political opinions and sentiments, which were those of Mr. Fox, of whom he was a devoted admirer. While acting as editor of the *Gazetteer* Mr. Perry effected a great improvement in the reporting department, by employing a series of reporters who should relieve each other by turns, and thus supply a constant and uninterrupted succession of matter. By this means he was enabled to give in the morning all the debates which had taken place on the preceding night, a point on which his predecessor in the editorship of the *Gazetteer* had frequently been in arrears for months, and in every case for several weeks.

One of Mr. Perry's favourite recreations was that of attending and taking part in the discussions of debating societies. In these humble but not inefficient schools of oratory, he always took a warm and active interest, and himself acquired a habit of speaking with singular fluency and force; a talent which procured him the notice of Pitt, who, then a very young man, was in the practice of frequenting a society in which Mr. Perry was a very frequent speaker, and who is said to have been so impressed with his abilities as an orator, as to have caused an offer of a seat in parliament to be conveyed to him, after he had himself attained the dignity of chancellor of the exchequer. A similar offer was afterwards made to Mr. Perry by Lord Shelburne, but his political principles prevented his accepting either of these flattering proposals.

Mr. Perry edited for several years Debrett's *Parliamentary Debates*, and afterwards, in conjunction with a Mr. Gray, bought the *Morning Chronicle* from Mr. Woodfall, a paper which he continued to conduct with great ability and independence of spirit and principle till his death, which took place at Brighton, after a painful and protracted illness, on the 6th December, 1821, in the sixty-fifth year of his age.

PHILLIP, JOHN, R.A. This admired painter, who achieved so high a reputation in modern art, was of very humble origin, his father, Peter Phillip, being nothing more than a working shoemaker, who had previously served as a soldier. John, the eldest of a family of five boys, only one of whom survived him, was born at Skene Square, in the city of Aberdeen, on the 19th April, 1817. From the poverty of his father's household it was necessary that he should contribute something towards the family maintenance; and accordingly, instead of continuing to enjoy the easy life of a school-boy at the Lancastrian school, which he had attended until he was eleven years old, he was employed as an errand-boy to a tinsmith in Hutcheson Street. Even in this occupation, however, and at so early an age, he gave indications of his favourite bent; and he was wont, when he became an admired artist, to speak of his boyish apprenticeship to art in the tinsmith's shop. A part of his master's occupation was to paint with a thick coating the pails and watering-cans which he fabricated. With the coarse pigments used for such a purpose, John Phillip began not only to draw but to paint pictures, such as fancy or the surrounding objects might suggest. After having in this way attempted the rudiments of form and colour, and when he had reached his thirteenth year, better help was provided for him by William Mercer, a prolific, if not a distinguished, portrait-painter at Mounthooly, with whom he accidentally became acquainted. Mercer supplied him with a few instructions and some better colours, and these Phillip used to such purpose that the teacher began to fear that his pupil would soon eclipse him. By this time Phillip had become known to a small circle in Aberdeen by his emblematic paintings on aprons and other insignia used in trades' processions. The procession at Aberdeen in consequence of the passing of the reform bill—perhaps the most gorgeous spectacle young Phillip had ever witnessed—seems to have called forth his ambition in this direction. His success in this department encouraged him to attempt a portrait of his grandmother, of whom he is said to have produced a striking likeness.

The first rise of the embryo artist from this lowly commencement was to the shop of Mr. Spark, a house-painter and glazier at Wallace Nuiik, Nether-kirk-gate, where his chief duties consisted in preparing the materials for his master's trade, and making himself "generally useful." Here he had better opportunities for pursuing his beloved occupation, his workshop being a dim cellar lighted by a little square window with a hinged shutter; and in this humble locality, situated at the top of the brae, next Wallace Tower, young Phillip dreamed glorious dreams of beauty, and endeavoured to embody his conceptions in painting, the pleasure of the occupation being enhanced by that which usually accompanies a draught of "stolen waters." For Mr. Spark was not an exacting master; and if he saw that work was going on under his eye, he concluded that it was equally brisk in his absence. Of this confidence young Phillip availed himself with the mischievous glee and cunning of boyhood. While Spark was

present, he diligently occupied himself in kneading putty, or some such process of the trade; but no sooner had the master gone out than the concealed sketch or unfinished painting was withdrawn from its hiding-place under the work-bench, and diligently continued until the sound of advancing footsteps warned him that Spark was returning. Back then went the picture to its hiding-place, and the artist to his grinding of putty. Many years afterwards he pointed to the little square window of this otherwise dark studio, by the light of which he had sketched and painted amidst all the excitement of a game of hide-and-seek that was going on outside. In this manner he remained in the employ of the house-painter and glazier until his growing progress made such a restricted scene and occupation uncongenial, when he was freed from it by an accidental hurt received while cleaning the windows—one of the drudgeries of the establishment which had been thrust upon him. On his recovery he refused to go back to his cellar, and being fortunately not indentured, he passed into the service of Mr. Anderson, a house-painter in Queen Street; but here his stay was very short, as the same ambition made him averse to the thought of an apprenticeship to the trade of house-painting. He now felt that he was fit for something better than colouring walls and ceilings. About this time one of his paintings had been publicly exhibited, but it was in the form of a sign-board. It blazed proudly over the shop-door of a basket-maker in Queen Street, and was the picture of a wicker-basket, with all its minute intricacy depicted with exactness. In like manner one of the earliest paintings of Wilkie, executed in boyhood, was that of a boy leading a horse to water, which served as the sign-board of a common inn at Cupar-Fife, until it was rescued from such ignominy, and is still preserved as a relic. Another painting by Phillip at this period was a portrait of Alexander Brechin, his maternal grandfather.

A happy change was now at hand, by which the genius of the young artist was to be aided, animated, and directed into its right course. Mr. James Forbes, portrait-painter, had set up his studio in Aberdeen, and to this he had added a gallery of pictures copied by himself from the originals in the Stafford collection. Such a golden opportunity of a regular education in art was not to be disregarded by John Phillip. Nor was he long in applying for it in the right way. One day, when Forbes was working in his studio, a boy called upon him, and inquired if he wanted a young lad to grind his colours, and was told that no one was needed for that purpose. Caught, however, by the stripling's intelligent eyes and eager countenance, the artist questioned him further, and the boy told him how, and with whom, he was employed. "And why," said Forbes, "if you are already with a painter, do you want to leave him?" "Because," said the other, who was Phillip himself, "I want to be a painter of pictures." Struck with his answer and the applicant's trembling eagerness, the kind artist's heart relented, and after obtaining the concurrence of the boy's father took him into his employ. To Phillip it was an entrance into Elysium: he had now the means and appliances of art at command; he was surrounded with the copies of the paintings in the Stafford gallery; and from these he was permitted to draw under the teaching of his employer, who was charmed with his attempts and the rapidity of his progress. Already, too, his power as a colourist, by which his paintings were afterwards so distinguished, was clearly indicated. Phillip had already commenced his profession by painting portraits at the price of a guinea for a pair, when husband

and wifewere included; and in one of these—a female face—the flesh tints were so well laid on, that Forbes declared he would never be able to equal it, though he should "paint his eyes out."

The first visit of Phillip to the metropolis was the most important event of his early life; and for the following account of it we are indebted to one of his friends:—"At seventeen he had an ardent desire to see the pictures in the famous metropolitan exhibition at the Royal Academy, then located at Somerset House, and had confided his wish to the friendly skipper of a coasting vessel, who, probably more in jest than in earnest, promised its fulfilment. Wearied, however, by two or three disappointments, the young enthusiast secreted himself on board, and only discovered himself after the smack had left port. The skipper enraged at finding he had been so unexpectedly taken at his word, threatened chastisement, but, soon pacified, set the extra hand to paint the figure-head. Arrived at London, the poor lad was detained two days to work out the ballast from the hold. At five o'clock in the morning of the third day he started from the docks, and reached Somerset House long before the doors were opened. Purchasing a biscuit for the day's consumption, he at length gained admission, and remained in the rooms gloating over the pictorial marvels till, using the painter's own words, he was 'swept out with the sawdust in the evening.' He saw no other 'London sight.' The same night, to redeem his promise, he went back to the smack, and in her returned to Aberdeen."

This was the exhibition of 1834. On a subsequent visit to London the paintings of Sir David Wilkie, which he had hitherto known only by engravings, greatly arrested his attention. He could understand their Scottish character and appreciate their genius, the effect of which was, that on his return to Aberdeen, he attempted a subject in the same style. It was the interior of a cobbler's kitchen, the house of his own father, with the stall, its adjuncts, and several figures, and in these he imitated not a little the style and treatment of Wilkie. This picture, after being exhibited in a shop-window in Aberdeen, was purchased by the late Mr. Farquharson of Haughton. Another painting of the same character, the "Packman's Visit," succeeded. The pedler has arrived at a farm-house; and the peasantry are assembled to witness the unpacking of his goods, and be tempted to a purchase.

This last production had an important influence on the career of the aspiring artist. Major Pryse Gordon, a connoisseur in painting and also an author on the subject, on visiting the studio of Mr. Forbes was struck with the merits of the "Packman's Visit," especially its power of colour, and at once recognized the qualities of an artist that only needed cultivation to attain eminence. He constituted himself the guardian of this youth, by receiving him into his house, and procuring a tutor to instruct him. All this was well; but unfortunately the patron and his client could not well understand each other, or be at one on the means by which excellence was to be reached; and while Major Gordon thought that regular industry was everything, and that Phillip, to become eminent, should keep painting from morning till night, the other thought that inspiration as well as industry was necessary, and that due intervals ought to be allowed in order to make its visits effectual. "Does he think," exclaimed the young artist indignantly, "that I can paint at no more expense of mind than what it took to put the red and green on the pails and roozers" [watering-cans]?—alluding to the occupation of his boyhood in the tinsmith's

shop. The bondage was so irksome, that twice he attempted to escape from it by going to sea, but was as often won back by a friend whose counsels he regarded. It must be acknowledged, however, that in other respects Gordon proved a kind and affectionate friend, and was always ready to advance the interests of his *protégé*. When he had got Phillip settled in his house, he not only engaged a tutor to instruct him, but proposed among his friends a subscription for his education in art. "Nay," said the late Lord Panmure, when the proposal was suggested, "if you have found such a gem to polish, as you say, we'll do it ourselves." These were not mere words; and it was the considerate kindness and munificence of his lordship which helped to smooth the young artist's career, and lead him to fame and comfortable independence. During the two years that Phillip resided with Major Gordon, he obtained so many commissions in portrait-painting, that he was soon in possession of £300 or £400. Among the kind exertions of Major Pryse Gordon was an arrangement which he had made with Mr. T. M. Joy, an artist in London, that Phillip should live with him and study under his direction; and in 1836 the latter repaired to the metropolis for the purpose. But their connection was short, as their tastes were different; for while Phillip was mainly attracted by colour, Mr. Joy was severely devoted to form. A parting between such ill-paired votaries of art was the consequence, and each went onward in his own way. Phillip, however, had not far to seek for other instructors; he was early admitted into the school of the Royal Academy, and soon took rank among the foremost pupils. The copies of pictures which he made there were greatly admired, and obtained a ready sale; and so highly did he think of them himself in after-years, that he was ready to repurchase them when occasion offered.

A sketch-portrait of himself painted in 1837, when he had reached his twentieth year, drew forth high commendations from competent judges for its excellent qualities, and for some years thereafter he maintained himself mainly by painting portraits. In 1838 and 1839 he sent some of his portrait productions to the exhibitions of the Royal Academy, where they were of such recognized merit as to find places on the wall. In 1840 Phillip returned to his native Aberdeen, and continued to reside there the next seven years, supporting himself by portrait-painting, but also carrying onward his professional studies into the regions of ideal art, and producing various fancy compositions.

The subjects of his earlier paintings of this kind were chiefly Scottish, and among the first of these in point of time was "The Eve of Bannockburn," painted for his generous patron the late Lord Panmure, which is now, with others of his works, in the Mechanics' Institution at Brechin.

In 1840 he first ventured to exhibit one of his imaginative productions at the Royal Academy: the subject being "Tasso in Disguise relating the History of his Persecutions to his Sister;" but this picture failed to arrest attention or excite remark, being hung in the architectural room. In the same year, at the exhibition of the Society of British Artists, were his "Roland Grème's first Interview with Catherine Seyton," "Maiden Meditation," and a portrait of J. James, Esq. Also at the British Institution, "A Falconer" and "Don Quixote." In 1841 he sent to the Royal Scottish Academy's exhibition four works:—"A Reaper," "Old Age—a Study," "A Pony with Terrier," and the picture of Tasso and his Sister already referred to; and in 1843, to the Society of British Artists, "Seeking whom she had displeased." These were followed in 1844 by

"She gave me a blink of her bonnie black e'e," and "Sancho Panza solving a Problem;" and in 1845 by "And the Child grew and waxed strong." In 1847 Phillip returned to London, and during this year he sent to the Royal Academy his picture of "Presbyterian Catechising," which showed a very marked improvement on his previous productions. This indeed was the first work which brought him into particular notice in London, and from this time he sent his contributions regularly to the Academy, although sometimes he had cause to complain that his pictures were placed in inferior positions. But however he might feel chagrined on such occasions, he continued to persevere, feeling satisfied that success would be achieved by determined industry. In 1848 he sent to the Royal Academy "A Scotch Fair," a large composition abounding in figures, displaying a great variety of life, character, and action. In 1849 he sent "Drawing for the Militia;" in 1850, "Baptism in Scotland;" and in 1851, "A Scotch Washing," "A Sunbeam," and "The Spæwife."

After twelve years of ardent occupation, and while his artistic reputation had been steadily advancing, a change occurred that formed an important epoch in his professional career. His health failed him, and he was advised to try the influence of a milder climate. In the autumn of 1851 Phillip went to Seville, and spent seven or eight months in that city, with much benefit to his health, and in a way that enabled him to make great advance in his art. With renewed strength and vigour he threw off any imitative tendency that appeared in his earlier works, and developed a style of his own, founded on no especial master, though partaking of some of the best qualities of the chiefs of the Spanish schools, whom he loved and admired, especially Velasquez.

On returning from Spain, where, during his brief sojourn, Phillip had produced an immense number of studies and sketches, he visited Sir Edwin Landseer, who was so much struck with their admirable qualities that he recommended their author to her majesty Queen Victoria. By royal order the Spanish sketches were transmitted to Windsor Castle, where they remained a week for inspection, and from that time her majesty became one of Phillip's most cordial as well as influential patrons. He was sent for to paint portraits of the two daughters of King Leopold of Belgium; and the queen and her royal consort selected several of the Spanish sketches, from which Phillip was commissioned to make pictures for the royal collection. Of these productions in her majesty's possession it is enough to mention the picture termed "El Paseo," "The Letter-writer of Seville," and the "Spanish Contrabandistas."

"In 1853 Phillip exhibited at the Royal Academy the first of his Spanish pictures, 'Life among the Gipsies at Seville,' and 'La Perla de Triana.' Their colour and masterly execution astonished every one;—in them technical qualities of the highest kind, combined with great variety of character and powerful expression and feeling, were brought out in a manner far higher than in the former much-prized works of the artist, who seemed at once to have imparted to his original style such depth of tone and richness of colour, that his works in these qualities now challenged comparison with those of the best masters, ancient or modern. The succeeding exhibitions of the Royal Academy were enriched by numerous works, mostly Spanish subjects, with occasionally portraits or incidents in Scottish life. In the catalogue of the exhibition of 1854, for instance, will be found the 'Lady Cosmo Russell;' and in 1855 that of 'Collecting the Offering at a Scotch Kirk'—a

picture full of character, and very powerful in colour and effect. In 1857 Phillip was elected an associate of the Royal Academy; and the pictures he exhibited that year were 'The Prison Window, Sevilla,' and 'Charity, Sevilla, 1857.' His much-admired picture in the exhibition of 1859, 'A Huff'—remarkable for its embodiment of female beauty, variety of character, brilliant colouring, and dexterous execution—secured his election as an academician in the unusually short period of two years after he was made an associate. The picture painted for her majesty of 'The Marriage of the Princess Royal with Prince Frederic William of Prussia,' exhibited in 1860, was a striking proof of the artist's power of overcoming the difficulty of representing a state ceremony, with all its regulated details, in such a way as to make it an admirable work of art; the perhaps even more difficult subject, representing the speaker and a number of the most distinguished members of the House of Commons engaged in their deliberations, was mastered with equal success; and, being one of the best portrait compositions executed in the British school, may be ranked as an historical picture of the highest interest and value. Numerous admirable productions every successive year showed the fertility of his imagination, his rapidity of execution, and constant advancement in his art. 'La Gloria' (1864), 'The Early Career of Murillo' (1865), and 'A Chat round the Braserio' (1866), are noteworthy examples. Phillip's second visit to Spain was in 1856-57; his third and last in 1860-61. In the spring of 1866 he went to Italy, and remained there about three months, the most of the time being spent in Rome.¹

The pictures which Phillip exhibited at the Royal Academy were fifty-one in number, and comprise his chief works. Of these the following is a list, with the years in which they were severally produced, and some notices of their subjects.

1840—Tasso in Disguise relating the History of his Persecutions to his Sister.

1847—Presbyterian Catechising.

A large picture. The scene is in the kitchen of a substantial farmer, which is thronged by an assembly of all ages, called together by the occasion. The chief figure is that of the minister, who is catechising a youth and a maiden standing before him.

1848—A Couple of Rustic Lovers.

They are consulting the Fates by blowing the down from the head of a seeded dandelion.

A Scotch Fair.

A large picture, showing every variety of character found in such a scene. Even episodes of love are seen in the midst of the buying and selling.

1849—Drawing for the Militia.

A large picture. The scene is a town-hall or court-house, wherein the authorities are assembled on the left, while the right is thronged by a great variety of characters. The principal incident is the operation of measuring the men, and the most important personage in the group in this quarter is a burly recruiting sergeant in the military fashion of the early part of the present century.

1850—Baptism in Scotland.

A picture remarkable for the amount and quality of the light which pervades it. The scene is the interior of a humble cottage; the figures are numerous; the principal impersonations being placed near the window. These are the father and mother with their infant, and on the other side the officiating minister; from this focus the composition opens upon each side into complimentary groups, embracing a great variety of character, and from this centre also the light is distributed and graduated.

1851—Scotch Washing.

A burnside, with groups of women and girls busied in washing clothes. Engraved on a large scale

in mixed style by S. Bellin. The print is titled "Heather Belles."

A Sunbeam.

A child on its mother's knee trying to catch a ray of light that streams through the cottage window.

The Spaewife of the Clachan.

1853—La Perla de Triana.

A characteristic study of a Spanish rustic coquette. Life among the Gipsies at Seville.

A large picture. The scene is apparently the yard of a *posada*, where two young Englishmen are surveying the lower strata of Spanish life, themselves as much observed by others as observers. The work comprises numerous figures, and presents great variety of character and grouping. Some of the gipsies as well as the townspeople are arrayed in their bright holiday attire. There is no leading incident, but plenty of action, and the interest is sustained throughout.

1854—The Lady Cosmo Russell.

A cabinet portrait. The lady is dressed in the Spanish style.

A Letter-writer—Seville.

At a street corner, an elderly man is writing a love-letter to the dictation of a lady. A woman of the lower orders with two children is standing by with a letter which she wishes to have read to her. Now in the royal collection at Osborne. Engraved by L. Stocks, A.R.A., in the *Art Journal*, vol. for 1858.

1855—El Paseo.

Two Spanish ladies on the promenade in national costume. The figures are half-length. Now in the royal collection at Osborne. Engraved by Devachez in the *Art Journal* vol. for 1859.

Collecting the Offering in a Scotch Kirk.

A tall elder presents a long-handled box ("ladle") to the tenants of a pew, some of whom contribute, others decline. A little girl has got a penny to pass into the box, but she holds it tightly, and would evidently rather retain it.

Portrait of Sir John Bent, late mayor of Liverpool.

Sunshine in the Cottage.

1856—Agua Fresca—on one of the Bridle Roads of Spain.

A muleteer has halted at a roadside well, where a woman is drawing water, one of whose earthen vessels he raises above his head and suffers the stream to flow into his mouth.

And the Prayer of Faith shall save the Sick.

The interior of a church in Spain during public worship. A woman, with an infant in her arms, has brought her sick boy to the church in the faith of a cure; behind her stands a tall aged man of the labouring class; on her right two damsels, one with a missal, the other with a fan—a procession is passing by.

Dona Pepita.

A Spanish lady seated as if at the theatre, shading her face with her fan.

A Gipsy Water-carrier of Seville.

A woman with water-jars. A life-sized study.

1857—The Prison Window—Sevilla, 1857.

A prisoner is at the window, to which his wife on the outside holds up their child that he may kiss his father; the mother looks down weeping. Engraved large by T. O. Barlow.

Charity—Sevilla, 1857.

A Spanish beggar-woman carrying a child asks alms of a priest, who, with a red umbrella under his arm, and his hands folded before him, passes by without taking any notice of her. Bread is seen exposed for sale on a stall near by.

1858—H. R. H. the Prince Consort.

Painted for the city of Aberdeen. A whole-length portrait in the Highland dress.

Al Duena.

The duena is in attendance on a lady young and pretty. Half-length figures.

El Cortejo.

Two Spanish figures, a man and a woman, in the costume of humble life.

Portrait of John Thomas, Esq.

Spanish Contrabandistas.

A large picture. It shows an interior in which some Spanish smugglers have taken refuge; one of their number mortally wounded, is anxiously tended by a woman who may be his wife. Another stands at a window preparing to fire on their pursuers. A mule, still in its trappings, stands near the dying man.

Youth in Seville.

A youth and a maiden in festal costume.

¹ Biographic notice in the *Catalogue of the National Gallery of Scotland*.

Daughters of the Alhambra.

Two girls at a window of Moorish design.

1859—A Huff.

A large composition, presenting a group of Spanish holiday-makers, of whom the principal and centre figure is a girl who stands pouting and angry, while her companion wishes her to turn round and speak to a man on horseback (her husband or lover), with whom she appears to have quarrelled.

Portrait of Augustus L. Egg, A.R.A.

A small picture. The subject is seated with a terrier on his knee.

1860—The Marriage of the Princess Royal with the Prince Frederick William of Prussia, January 25, 1858.

On the left is the Archbishop, and before him kneel the Prince and Princess. Immediately behind the latter the bridesmaids are kneeling, and towards the right stand the Queen, the Prince Consort, the Prince of Wales, and other members of the royal family, with a numerous attendance. On the left are the members of the Prussian court, and in the back-ground a number of figures more or less in shade. This picture has been engraved on a large size in the line manner by Blanchard.

Prayer.

A Spanish woman—a fruit-seller—sits in a church in fervent prayer; near her is a girl who is flirting her fan and showing little trace of penitence. The artist's diploma work, deposited in the Royal Academy on his election as academician.

1861—Spanish Gossips at a Well.

Some men—one of them a muleteer—have met two buxom girls at a fountain, and are bantering and jesting with them. One of the girls stands in pretended dignity, while the head of the other is half-hidden behind her; and the muleteer has withdrawn his cigar from his mouth to give utterance to some jest.

1862—A Spanish Volunteer.

The volunteer before setting out is embracing his wife, who clings closely to him, while his mother holds his gun.

Doubtful Fortune!

A Spanish lady is consulting a gipsy fortune-teller, and drawing a card from a pack held by her.

Water Drinkers.

Two ladies stop in the street to drink water poured for them from a jar by a sturdy fellow, who, cigarette in mouth, raises the vessel on his knee. The figures are half-length.

Dolores.

1863—Agua Bendita.

A scene at the porch of a church in Spain. Before the holy-water vessel fixed near the entrance, two parties have met—a young lady with her infant and her husband, and a gipsy woman, who kneels and receives the holy water from the child's fingers.

The House of Commons, 1860.

The most prominent figure is that of the prime minister, Lord Palmerston, who stands in the act of addressing the House; in various parts are grouped the other important members of the House. All are portraits, and the difficulties incident to the pictorial rendering of such a scene are very successfully overcome. Painted for the late Speaker. Engraved on a large size in mixed style by T. O. Barlow.

1864—La Gloria—a Spanish Wake.

At one side of the picture an open door gives a glimpse into a partly darkened room, where on a couch lies the dead body of a child, crowned with flowers. Near the door crouches the young mother, whose face and action strikingly express her sense of bereavement. Two women address her with soothing words, and entreat her to join a noisy throng of friends and neighbours who dance and sing in the street,—their mode of showing their belief that the child is now in glory.

Portrait of the Earl of Dalhousie.

1865—The Early Career of Murillo, 1634.

A market-place in the great square of a town. Murillo, who is little more than a boy, has come among others to dispose of his wares—little pictures of saints, male and female. Two friars have halted to look at his work, and one of them has taken a picture into his hand to examine it. A Spanish peasant woman with a child in her arms is staring eagerly at the picture which is under judgment. On the left

of the woman is a fellow seated sideways on a mule, who munches his dinner as he swings along.

A Prima Donna in the Character of Rosina.

Fan in hand and peeping sideways at a letter.

1866—The Right Hon. Duncan M'Neill, of Colonsay, Lord President of the Court of Session; to be placed in the Parliament House, Edinburgh.

A Chat round the Brascero.

A Spanish priest is telling stories to a number of women as they sit together round a brazier in the middle of a room. He has paused to light his cigarette, and also to enjoy the laughter his story has caused. An old woman is shaking with laughter; a dark brown damsel covers her mouth, while another young woman rolls backward in her chair, giving full vent to her merriment.

Portrait of Mrs. Cooper.

1867—"O Nannie, wilt thou gang wi' me?"

A lad and lass in confidential converse.

A Highland Lassie reading.

Antonia. A half-length figure.

Besides these, two paintings, said to be the last from the easel of this great artist, ought still to be mentioned. They are illustrative of the national lottery in Spain, the one being the "Purchase of the Tickets," the other "The Results of the Drawing." In the first all are rushing helter-skelter to the purchase, while the face of every buyer is lighted with hope; in the second, there are the few happy countenances of the winners, while the looks of the many are distorted with every shade from disappointment to despair. The subjects are treated not only with the humour but much of the moral power of Hogarth. These paintings were exhibited, not at the Royal Academy, but by the Messrs. Agnew in the summer of 1867.

While in his earlier years Phillip industriously painted portraits for a living, in his after-years, when he had gained both fame and emolument, he painted portraits for enjoyment, when he found a subject worthy of his powers, or one that personally interested him.

He was fond "of presenting to his friends sketches or portraits of themselves or of relatives dear to them; and the houses of many who had the honour and pleasure of his acquaintance are thus enriched by productions of his ready and industrious pencil, which could be readily sold at high prices did not their owners prefer to cherish them as memorials of the painter's friendship. Indeed, his devotion to his art for its own sake was so great as to induce in him an almost blamable disregard of fit remuneration—and certainly in the course of his work he never considered the rate of payment, but bent his best powers to everything he undertook. At the same time, for fifteen or sixteen years all that he did secured high prices. He was overwhelmed with orders, and it had long been easier to get from him a specimen of his work for love than for money. At the time of his death he had work before him for many years—having on hand, it is understood, commissions to the amount of £20,000. He left a number of noble works in progress, many of them of Spanish subjects, but some of the very latest are Scotch. Among the former of these may be mentioned "Spanish Boys Playing at Bull-fighting." In this large painting, the spirit of the boys, while engaged in an imitation of the great national pastime, is admirably delineated; all are animated by chivalrous ardour mixed with boyish glee; and while a beautiful woman is withdrawing hastily from the uproar, a veteran bull-fighter seems to be warming into "a boy again" at the spectacle. This painting, executed in his best style, Phillip brought from Spain. He received a commission from the Royal Association for the Promotion of the Fine Arts to finish it, with a view to its being placed in the National Gallery of his native

country; but death made the purpose unavailing. Such, however, even in its unfinished state, are the remarkable qualities of the picture, that the Royal Association accepted it at the price for which they had stipulated when finished, and it now adorns the National Gallery in Edinburgh. In the same collection is a reduced copy by Phillip of the celebrated picture by Velasquez of the "Surrender of Breda," in the museum at Madrid, generally called "Las Lanzas," from the spears or pikes of the soldiers in line, in the middle distance.

To this general sketch only a few particulars need to be added. Besides being a member of the Royal Academy, Phillip was an honorary member of the Royal Scottish Academy, an institution in which he took a warm interest, and during the last twelve years he annually enriched its exhibitions by several important works of his own which were among the chief attractions of the collection. These pictures had previously been exhibited in London, and were obtained in loan from their owners.

Although half a Spaniard in the choice of his line of art, and half a Londoner by long residence in the British capital, his heart never ceased to beat affectionately towards Scotland; he was well-known in Edinburgh, where his almost unbroken annual visits created a stir of satisfaction; and one of the chief objects of his ambition was to obtain a habitation and resting-place upon his native soil, in which he succeeded a few years before he died by the purchase of a cottage or shooting-box in Glen Urquhart. It was at Divach, a picturesque spot at the head of the glen; and in this Highland abode, he hoped not only to enjoy a healthful summer residence, but a permanent at last, when his toils were exchanged for the enjoyment of a tranquil old age. In the meantime he prosecuted his art so diligently that his works continued steadily to improve in excellence; and being still in little more than the meridian of life—for he had not yet completed his fiftieth year—his admirers reasonably anticipated such success from his matured powers as would exceed his past performances, distinguished though they had been. An attack of low fever however, from which he recovered, was succeeded on Tuesday the 19th of February, 1867, while conversing with a brother artist, by a stroke of paralysis, from the effects of which he died on the 27th of the same month. The unexpectedness of such an event deepened the sorrow of his friends and the public at large, who hoped that he would be continued to them many years longer, and that he would yet attain still higher excellence. Thus passed away our modern Velasquez—an artist who had won for himself the reputation of being perhaps the first colourist not only in Britain, but in Europe. The chief technical characteristics of his style may be said to be great breadth of treatment and powerful colour. "He threw his whole soul into his subject, seizing with the instinct of genius its main points and effects, and he worked with a zeal and enthusiasm which often overtasked his physical powers. The result of his Spanish experience, however, was only a splendid development, or gorgeous blossoming, of his genius. He was the same painter, as he was the same man throughout, only growing greater in his art, and dearer to his friends, year by year. His vigorous and characteristic delineations of the manners and customs of the Andalusians—in number almost numberless, and infinite in variety; some simply descriptive, some humorous, some full of passion or of pathos—excited universal admiration in the world of art—admiration warmly shared by his brother artists, who acknowledged him with one voice as at

the very head of his profession in his own style. And on art he has undoubtedly left his mark more distinctly and emphatically than any of his contemporaries can hope to do."

His personal character is thus given by one who knew him intimately and enjoyed his friendship:—"Manliness, honesty, perseverance, fortitude, and geniality were the chief traits of Phillip's character as a man. He was alike beloved and respected by all who knew him, and throughout a life chastened by severe trial and affliction, conducted himself at all times so as to enhance the love and esteem of those who knew him best. The suffering and depression he occasionally endured never disabled him from rejoicing with those that rejoiced: in his many trials he always found solace in the society of his friends, or in devotion to his much-loved art. Artists endowed with faculties such as John Phillip possessed are of rare occurrence, and are never repeated. We have had greater artists, and we hope to have greater still. His genius was only exceeded by his industry; his art was only exceeded by his lovable qualities as a man, and his complete sinking of self and selfishness in all that he said or did."

When he died, the artist left behind him a widow and two children, the elder a daughter approaching maturity, and the younger a son about ten years of age.

PICKEN, ANDREW. This amiable and agreeable writer in miscellaneous literature was born at Paisley, in 1788. His father, who was a wealthy and thriving manufacturer of the town of Paisley, intended that his son Andrew should follow the mercantile profession, and to that effect the youth was educated. While still very young, he repaired to the West Indies, but finding, on close trial, that the office he held offered few of those advantages it had promised, he returned home, and obtained a confidential situation in the Bank of Ireland. Here he might have enjoyed years of tranquil comfort, and retired at last with a competence, if he could have contented himself with the monotonous routine of a banking establishment; but having either too much genius, or too little firmness and self-denial, for such a life, he threw up his charge, to the great regret of his friends in Ireland; returned to Scotland, and commenced business in Glasgow on his own account. But, unluckily for his interests, the same restless and aspiring spirit continued to haunt him; and finding the occupations of the counting-house insufficient, he combined them with the more attractive and congenial pursuits of authorship. We can easily guess how such a merchant would be regarded in those days by his brethren of the Tontine, and what faith they would attach to bills subscribed by the same hand that wrote stories and novels. In the meantime, his first work came out, under the title of *Tales and Sketches of the West of Scotland*; and, independently of the novelty of such a *rara avis* as a Glasgow *littérateur*, the intrinsic merits of the work itself secured for it a large share of local popularity. Among these tales, that of "Mary Ogilvie" is an admirable specimen of his dramatic power in investing ordinary events with high interest, and giving them unwonted influence over our best feelings. As an offset, however, to this, one of the sketches produced a very opposite effect; it was "On the Changes of the West of Scotland during the Last Half-century;" and every one aware of these changes can easily divine how hard his notices must have occasionally borne upon some of the most influential and worshipful of the rising city of Glasgow. These notices Mr. Picken did not withhold; on the contrary, he revelled among them

with such satirical glee, that the strongest part of the community was in arms against him. This, and other additional causes, soon made the metropolis of the west too hot for him, and accordingly he removed to Liverpool. The change of place was accompanied by change of occupation, for in the town of his new residence he commenced the trade of bookseller.

From the foregoing statement it will easily be judged, that whether merchant, banker, or bookseller, Mr. Picken was not likely to be prosperous. He had no love of traffic, either for its own sake or for its profits; and, besides this, he was too sanguine and too credulous either to win money or to keep it. This was especially the case in 1826, when mercantile speculation was so rampant. Induced by the persuasions of friends, he embarked his all among the hazardous ventures of the day, and that all was lost. Even then, however, when his books as a bankrupt were inspected, his integrity was so manifest, that his creditors, after sympathizing with him in his losses, were ready to aid him in commencing business anew; but of this he seemed to think he had got enough. He now resolved to surrender himself wholly to literature as a profession, and for that purpose he removed to London, with a novel in his pocket, the composition of which had been his solace in the season of distress. This work, entitled the *Sectarian*, was published by Colburn, and on its first appearance excited considerable attention, on account of its vivid sketches, chiefly of morbid feelings and their effects; but however such anatomy may interest for the moment, a reaction of pain, or even of absolute disgust, is certain to follow, and the work is thrown aside, never to be reopened. This, however, was not the chief cause that made the *Sectarian* a failure. It contained such a sketch of religious melancholy, terminating in madness, as gave offence to the sober-minded, drawn though it was from a living reality. Although this literary production was so unfortunate in itself that it never became popular, and soon passed away, its evidently powerful writing was the means of introducing its author to the editors of our chief periodicals, who were glad to avail themselves of his services, on which account he was a frequent contributor to the reviews and magazines of the day.

Mr Picken had now fully embarked in authorship as a trade, and with such an amount of talent and perseverance as might have won his way to fortune in any other department. In 1830 he published the *Dominie's Legacy*, a work whose success made ample amends for the failure of the *Sectarian*, as it raised him at once to a high rank among the delineators of Scottish humble life. In this, too, he succeeded all the more, that instead of converting facts into mere pegs for theories and opinions of his own, he tells right onward what he saw and what he felt, and makes truth and reality everything—a process in which he was sure to carry along with him at least nine-tenths of his readers. His next work was the *Lives of Eminent Missionaries*, which he undertook for Colburn's *Juvenile Library*; but as this serial publication was brought to a close before his *Lives* were ready for the press, they were subsequently published in a separate volume by Kidd, and passed through two large impressions. Picken's next work was the *Club Book*, a collection of papers, some of which were contributed by distinguished living writers; but even among these his own tales were not of inferior interest or power. In proof of this may be mentioned the *Three Kearneys*, a sketch of Irish life, and the *Deer-stalkers*. Soon after the *Club Book* he published a work on the Canadas, but chiefly a compilation, in which he received important

aid from his friend Mr. Galt. This was followed by *Walham*, a tale, which appeared in Leitch Ritchie's *Library of Romance*.

This rapid succession of works within so brief a period only seemed to animate Picken to further efforts, and in 1832 he published *Traditionary Stories of Old Families*, in two volumes. He thus ascended to what might be termed the fountain-head and source of the romance of biography. As this was designed merely as the first part of a series that should comprise the legendary history of England, Scotland, and Ireland, the work excited considerable interest among the aristocracy, many of whom offered him free access to their family archives for the successful continuation of his task. But before he could avail himself of this courteous permission, his career was suddenly terminated. On the 10th of November, 1833, while conversing with his son, he was struck down in a moment with apoplexy, but afterwards rallied so effectually, that hopes of his full recovery were entertained by his family and friends. These hopes proved fallacious, for after an evening of cheerful conversation with his wife and children, he expired early next morning (the 23d of November), but so tranquilly, that he seemed only to have turned himself again to sleep.

Besides the works we have already enumerated, Picken, a short time before he died, had completed the *Black Watch*, a tale containing the origin of the 42d regiment and its exploits during the period of Fontenoy, and those stirring campaigns which, as yet, historical novel-writing had left untouched. This work, which he regarded as his best, was the only legacy which he could bequeath to his wife and six children, who were left otherwise unprovided by his death.

PINKERTON, JOHN, a voluminous historian and critic, was born at Edinburgh on the 17th February, 1758.¹ He was the youngest of three sons of James Pinkerton, who had, in Somersetshire, acquired an independence as a dealer in hair, and returned to his native country, Scotland, where he married a widow whose maiden name was Heron. The opening of young Pinkerton's intellect fell to the charge of an old woman acting as schoolmistress of a village near Edinburgh, and he was afterwards removed to the grammar-school of Lanark. At school he is said to have shown, in apathy and abstinence from the usual boyish gratifications, the acidity of disposition for which he was afterwards more particularly distinguished. Hypochondria, inherited from his father, is believed to have been the primary cause of the characteristic. He is said to have publicly distinguished himself at school by his early classical acquirements, having, as an exercise, translated a portion of Livy, which his preceptor, on a comparison, decided to be superior to the same passage as translated in Hooker's *Roman History*. After having remained at school for six years he returned to Edinburgh. The dislike of his father to a university education seems to have for some time after this period subjected him to a sort of half literary imprisonment, in which, by alternate fits, he devoted his whole time to French, the classics, and mathematics. Intended for the legal profession he was apprenticed to Mr. Aytoun, an eminent writer to the signet, under whose direction he remained for the usual period of five years. Apparently during his apprenticeship, in 1776, he published an *Ode to Craigmillar Castle*, dedicated to Dr. Beattie. The professor seems to have given the young poet

¹ Nichol's *Lit. Illustrations*, v. 666.

as little encouragement as a dedicatee could in politeness return. "There are many good lines," he says, "in your poem; but when you have kept it by you a week or two, I fancy you will not think it correct enough as yet to appear in public."¹ But Pinkerton had a mind too roughly cast for poetry, and it was only when his imitations were mistaken for the rudeness of antiquity that his verses were at all admired.

After 1780, when his father died, he visited London, and having previously contracted a slight bibliomania, the extent and variety of the booksellers' catalogues are said to have proved a motive for his taking up his residence in the metropolis as a literary man, and eschewing Scotch law. In 1781 he published in octavo some trifles, which it pleased him in his independence of orthography to term *Rimes*. This work contained a second part to *Hardyknute*, which he represented as "now first published complete." If Pinkerton thought that his imposition was to get currency by being added to a ballad really ancient, the circumstance would show the extreme ignorance of the period as to the literature of our ancestors; for it is now needless to remark how unlike this composition is to the genuine productions of the elder muse. The imposition in this case was not entirely successful. "I read over again," says Mr. Porden the architect, "the second part of *Hardyknute*; and I must inform you that I have made up my mind with respect to the author of it. I know not whether you will value a compliment paid to your genius at the expense of your imitative art, but certainly that genius sheds a splendour on some passages which betrays you."² In 1782 appeared a second edition of the *Rimes*, and at the same time he published two separate volumes of poetry, which have dropped into oblivion. In the ensuing year he published, in two volumes, his *Select Scottish Ballads*, a work rather more esteemed. At this period he turned the current of his laborious intellect to numismatics. Early in life a latent passion for the collection of antiquities had been accidentally (as is generally the case with antiquaries) called into action. He drew up a manual and table of coins for his own use, which afterwards expanded itself into the celebrated *Essay on Medals*, published in two volumes 8vo, in 1784; and published a third time in 1808. These volumes form a manual which is continually in the hands of numismatists. In 1785 he published, under the assumed name of Robert Heron, a work termed *Letters of Literature*: the singularity of this work suggests that its author was guilty of affecting strangeness for the purpose of attracting notice. Among the most prominent subjects was a new system of orthography, or, more properly, of grammar, which, by various transmutations, such as classical terminations (e.g. the use of *s* instead of *z* in forming plurals), was to reduce the harshness of the English language. Such an attempt on the public sense was not in all respects effective, but the odium occasioned very naturally fell on poor Robert Heron, who was just then struggling into being as a literary man. The work, however, procured for Pinkerton an introduction to Horace Walpole, who made him acquainted with Gibbon. The proud spirit of that great historian seems to have found something congenial in the restless and acrid Pinkerton. He recommended him to the booksellers as a person fit to translate the *English Monkish Historians*. In an address which Gibbon had intended to prefix to the work, his protégé was almost extravagantly lauded: but the plan as then designed

was never put in practice. The friendship of Walpole continued till his death; and, light and versatile in his own acquirements, he seems to have looked on the dogged perseverance and continually accumulating knowledge of Pinkerton with some respect. After Walpole's death Pinkerton sold a collection of his *Ana* to the proprietors of the *Monthly Magazine*, and they were afterwards published under the title *Walpoliana*.

In 1786 Pinkerton published "*Ancient Scottish Poems*, never before in Print, but now Published from the Manuscript Collections of Sir Richard Maitland of Lethington, Knight, Lord Privy-seal of Scotland; comprising Pieces written from about 1420 till 1586: with Large Notes and a Glossary." Pinkerton maintained that he had found the manuscript in the Pepysian Library at Cambridge, and in his correspondence he sometimes alludes to the deceit with very admirable coolness. The forgery was one of the most audacious recorded in the annals of transcribing. Time, place, and circumstances were all minutely stated—there was no mystery. Among Pinkerton's opinions as to character, that of literary impostor was of the most degraded order. The whole force of his nature and power over the language were employed to describe his loathing and contempt. On Macpherson, who executed the task with more genius but certainly much less historical knowledge than himself, he poured the choice of his denunciations. In 1787 he published "*The Treasury of Wit*;" being a Methodical Selection of about Twelve Hundred of the best Apophthegms and Jests, from Books in several Languages." This work is not one of those which may be presumed to have been consonant with Pinkerton's pursuits, and it probably owed its existence to a favourable engagement with a bookseller; but even in a book of anecdotes this author could not withstand the desire of being distinct from other men, and took the opportunity of making four divisions of wit and humour, viz. "serious wit, comic wit; serious humour, and comic humour." During the same year he produced a "*Dissertation on the Origin and Progress of the Scythians or Goths*," being an Introduction to the Ancient and Modern History of Europe." In the compilation of this small treatise he boasts of having employed himself eight hours per day for one year in the examination of classical authors: the period occupied in consulting those of the Gothic period, which he found to be "a mass of superfluity and error," he does not venture to limit. This production was suggested by his reading for his celebrated account of the early history of Scotland, and was devised for the laudable purpose of proving that the Celtic race was more degraded than the Gothic, as a preparatory position to the arguments maintained in that work. He accordingly shows the Greeks to have been a Gothic race, in as far as they were descended from the Pelasgi, who were Scythians or Goths—a theory which, by the way, in the secondary application, has received the sanction of late etymologists and ethnologists of eminence—and, by a similar progress, he showed the Gothic origin of the Romans. Distinct from the general account of the progress of the Goths, which is certainly full of information and acuteness, he had a particular object to gain in fixing on an island formed by the influx of the Danube in the Euxine Sea, fortunately termed by the ancient geographers "*Peuke*," and inhabited by Peukini. From this little island, of the importance of which he produces many highly respectable certificates, he brings the Peukini along the Danube, whence, passing to the Baltic, they afterwards appear in Scotland as the Picts or Pechts.

¹ Pinkerton's *Correspondence*, i. 2.

² *Ibid.* i. 25.

At this period Pinkerton appears to have been an unsuccessful candidate for a situation in the British Museum. Horace Walpole says to him in a letter of the 11th February, 1788, "I wrote a letter to Sir Joseph Banks, soliciting his interest for you, should there be a vacancy at the museum. He answers (and I will show you his answer when I see you), that he is positively engaged to Mr. Thorkelin, should Mr. Planta resign; but that, the chancellor having refused to sign the permission for the latter, who will not go abroad without that indulgence, no vacancy is likely to happen from that event."¹ In 1789 he edited from early works, printed and manuscript, *Vite Antiquæ Sanctorum Scotorum*. This work, of which only one hundred copies were printed, is now scarce and expensive; but at its appearance it seems to have met little encouragement from the author's countrymen. "Mr. Cardonnel," says Pinkerton, in a letter to the Earl of Buchan, "some months since informed me that, upon calling at Creech's shop, he learned there were about a dozen subscribers to the *Vite Sanctorum Scoticæ*. Upon desiring my factor, Mr. Buchan, since to call on Mr. Creech, and learn the names, Creech informed him 'there were about two or three; and the subscription paper was lost, so he could not tell the names.'"² During the same year Pinkerton published his edition of Barbour's *Bruce*. Although the most correct edition up to the period of Dr. Jamieson's publication, it was far from accurate, and gave the editor ample opportunity of vituperating those friends who incautiously undertook to point out its mistakes. In 1790 appeared the *Medallie History of England to the Revolution*, in 4to, with forty plates; and at the same time, the *Inquiry into the History of Scotland preceding the Reign of Malcolm III.*, or 1056, including the *Authentic History of that Period*. This work contained a sort of concentration of all his peculiarities. It may be said to have been the first work which thoroughly sifted the great "Pictish question"—the question whether the Picts were Goths or Celts. In pursuance of his line of argument in the progress of the Goths, he takes up the former position; and in the minds of those who have no opinions of their own, and have consulted no other authorities, by means of his confidence and his hard terms he may be said to have taken the point by storm. But he went farther in his proofs. It was an undoubted fact that the Scots were Celts, and all old authorities bore that the Scots had subdued the Picts. This was something which Pinkerton could not patiently contemplate; but he found no readier means of overcoming it than by proving that the Picts conquered the Scots—a doctrine founded chiefly on the natural falsehood of the Celtic race, which prompted a man of sense, whenever he heard anything asserted by a Celt, to believe that the converse was the truth. He amused himself with picking out terms of reproach for the Macphersons: of the doctor, he said, "His etymological nonsense he assists with gross falsehoods, and pretends to skill in the Celtic without quoting a single MS.; in short, he deals wholly in assertion and opinion; and it is clear that he had not even an idea what learning and science are:"³ of the translator he not less politely observes, "He seems resolved to set every law of common science and common understanding at defiance."⁴

His numberless observations on the Celts are thus pithily brought to a focus: "Being mere savages, but one degree above brutes, they remain still in

much the same state of society as in the days of Julius Cæsar; and he who travels among the Scottish Highlanders, the old Welsh, or wild Irish, may see at once the ancient and modern state of women among the Celts when he beholds these savages stretched in their huts, and their poor women toiling like beasts of burden for their unmanly husbands."⁵ And he thus draws up a comparison betwixt these unfortunates and his favourite Goths. "The Lowlanders are acute, industrious, sensible, erect, free: the Highlanders, indolent, slavish, strangers to industry. The former, in short, have every attribute of a civilized people: the latter are absolute savages; and, like Indians and negroes, will ever continue to . . . All we can do is to plant colonies among them, and by this, and encouraging their emigration, try to get rid of the breed."⁶ Pinkerton proved indeed a sore visitation to the Celts. Moderate men had no objections to a conflict which might at least bring amusement, and might serve to humble the arrogance by displaying the ignorance of a people who seemed to take an unfortunate pride in the continuance of barbarism. Few took their side; and Pinkerton had many triumphs over their native champions in the recurrence of that ignorance of their own history which he maintained to be their characteristic. His knowledge of history effectually foiled any claim put in for Celtic merit. He would call on the company to name a Celt of eminence. "If one mentioned Burke," observes a late writer: "What," said he, "a descendant of De Bourq? Class that high Norman chivalry with the rif-raff of O's and Mac's? Show me a great O', and I am done." He delighted to prove that the Scottish Highlanders had never had but a few great captains, such as Montrose, Dundee, the first Duke of Argyll; and these were all Goths—the two first Lowlanders, the last a Norman, a *De Campo Bello*.⁷

In 1792 Pinkerton edited *Scottish Poems, reprinted from Scarce Editions*, in three volumes octavo. In 1796 appeared his *History of Scotland during the Reign of the Stuarts*, in two volumes quarto, one of the most unexceptionable of his historical works, and still the most laboured and accurate complete history of the period. In 1798 he married Miss Burgess of Odiham, Hants, sister to Thomas, Bishop of Salisbury. The union was unhappy, and the parties separated. In 1795 and 1797 he bestowed some pains in preparing lives of Scotsmen for the *Iconographia Scotica*, two volumes octavo; but the information in the work is very meagre, and the plates are wretchedly engraved. In 1802 he published, in two volumes quarto, *Modern Geography, digested on a New Plan*—a work somewhat hastily got up, and deficient in some of its parts, but still one of the most compendious and useful geographical works of the period. A second edition was published in 1806, in three volumes; and an abridgement in one octavo, is well known. At the commencement of the century he visited Paris; and in 1806 published *Recollections of Paris in the years 1802-5*, two volumes octavo. For some years after this period he found employment in editing *A General Collection of Voyages and Travels*, extending to nineteen volumes quarto, and a *New Modern Atlas*, in parts. For a short period he also edited the *Critical Review*. His last work was on a subject foreign to his previous studies, but which appears from his correspondence to have occupied much of his attention during his old age: it was entitled *Petralogy, or a Treatise on Rocks*, two volumes octavo, 1811. his latter years he resided in Paris, where he died, in indigent circumstances, on the 10th March, 1825, at the age of sixty-seven. He is described to have been "a very little and very thin old man, with a very small, sharp, yellow face, thickly pitted by the small-pox, and decked with a pair of green spectacles."¹

PITCAIRNE, DR. ARCHIBALD, an eminent physician of the seventeenth century, was born at Edinburgh on the 25th December, 1652. His father, who was descended of an ancient family in Fife, was an eminent merchant, and one of the magistrates of the city. His mother, whose name was Sydsenf, was a member of a highly respectable family in East Lothian. Dr. Pitcairne received the earlier part of his education at Dalkeith. He was afterwards removed to the university of Edinburgh, where he made great progress in classical learning, and completed a regular course of philosophy. His subsequent education ranged over the extensive field of the three professions pre-eminently styled learned. At the request of his friends, who were desirous that he should devote himself to the church, he first entered on the study of theology, but finding neither this study nor the profession to which it led at all suitable to his temper, disposition, or habits, he abandoned it, and turned his attention to law.

To this pursuit, which he found more congenial than the other, and in which he became fired with an ambition to excel, he devoted himself with an ardour and intensity of application that induced symptoms of approaching consumption. To arrest the progress of this malady, he was advised by his physicians to repair to the south of France for the benefit of the milder climate of that country. By the time, however, that Mr. Pitcairne reached Paris he found himself so much better, that he determined on remaining in that city, and resuming his legal studies there; but having formed an acquaintance, while in the French capital, with some agreeable young men from Scotland, who were engaged in the study of medicine, he was prevailed upon by them to abandon the law and to join in their pursuits. To these he applied accordingly for several months, when he was recalled to Edinburgh by his father. This was now the third profession which he had begun, and the indecision of his conduct with regard to a permanent choice naturally gave much uneasiness to his friends; but this was allayed by his finally declaring for physic, and applying himself with extraordinary diligence to the study of botany, pharmacy, and materia medica. He afterwards went a second time to Paris to complete his studies, and on that occasion acquired an entire and profound knowledge of medicine. Thus prepared, he returned to his native city, where he practised with singular success till the year 1692, when his great reputation, which was now diffused throughout Europe, and which had been not a little increased by his able treatise regarding Hervey's discovery of the circulation of the blood, entitled *Solutio Problematis de Inventoribus*, procured him an invitation from Leyden to the professorship of physic in the celebrated university of that city; and so sensible were the patrons of the merits of Dr. Pitcairne, and the value of his services, that the invitation was accompanied by the offer of a much larger salary than had been usually attached to the office. Dr. Pitcairne accepted the invitation, but remained in Leyden only twelve months. At the end of that period he came over to Edinburgh to marry a daughter of Sir Archibald Stevenson, an

eminent physician in the latter city, to whom he had been betrothed before leaving Scotland, and whom it was his intention to carry along with him to Leyden; but the lady's friends objected to her going abroad, and Dr. Pitcairne so far yielded to these objections as to resign his professorship, and reconcile himself to the resumption of his practice as a physician in his native city. Nor had he any reason to regret the change thus in a manner forced upon him, for he soon found himself in possession of a most extensive and lucrative business. During the short time he was at Leyden Dr. Pitcairne chose the texts of his medical lectures from the writings of Bellini, who, in return for this flattering compliment, dedicated to the doctor his *Opuscula*.

Dr. Pitcairne's reputation for skill in his profession now daily increased. He was consulted by patients in distant parts of Scotland, and frequently from England and Wales, and was altogether looked upon as the most eminent physician of his time. Nor was his fame as a scholar behind that which he enjoyed as a medical practitioner. His *Solutio Problematis*, &c., published soon after he had first commenced business in Edinburgh, had gained him much reputation as a learned man as well as a skilful physician, and he still more strongly established his claims to the former character by a quarto work, entitled *Archibaldi Pitcairni Dissertationes Medice*, which was published at Rotterdam in 1701, and dedicated to his friend Bellini. Dr. Pitcairne also wrote Latin poetry with very considerable elegance and taste, although Wodrow, in his *Analecta*, speaks of him in this capacity as only "a sort of a poet." But he was something more than this, and had not the subjects of his muse unfortunately been all of but transitory interest, and therefore now nearly wholly unintelligible, his fame as a Latin poet would have been very far from contemptible. Some of these poems were published in 1727 by Ruddiman, in order to meet a charge which had been made upon Scotland that it was deficient in this department of literature.

Dr. Pitcairne's chief work was published in 1718, under the title of *Elementa Medicinæ Physico-Mathematicæ*, consisting of his lectures at Leyden. He was considered to be the first physician of his time. His library is said to have been one of the best private collections of that period; and it was purchased, after his death, by the Czar of Russia. In addition to his Latin verses, he was the author of a comedy called *The Assembly*, which is a sarcastic and profane production: also *Babell; or the Assembly, a Poem*, 1692, both being intended to turn the proceedings of the General Assembly into ridicule. Dr. Pitcairne was a Jacobite and an Episcopalian; and his talent for satire was often directed against the Presbyterians, who accused him of being an atheist and a scoffer and reviler of religion. Wodrow even goes the length of retaliating upon him by a serious charge as to his temperance. An atheistical pamphlet published in 1688, entitled *Epistola Archimedis ad Regem Gelonem Albiæ Græciæ reperta anno æræ Christianæ*, was ascribed to Pitcairne; and when the Rev. Thomas Halyburton entered upon the office of professor of divinity in the university of St. Andrews in 1710, his inaugural discourse was a refutation of the arguments of this performance, and was published in 1714 under the title of *Natural Religion insufficient, and Revealed necessary to Man's Happiness*. His verses written on Christmas-day have been referred to as a proof of Dr. Pitcairne's orthodoxy, on which he had himself thrown a doubt by his profane jesting and his habitual scoffing at religious men; and it is added, on the authority of Dr. Drummond, that,

¹ Nichol's *Illustrations*, v. 671.

during his last illness, he evinced just apprehensions of God and religion, and experienced the tranquillity of mind which can arise from no other source. As a man of science, he was far in advance of the age in which he lived; and the zeal with which he propagated Hervey's beautiful discovery of the circulation of the blood, is a proof of liberality of feeling which was by no means common at that period among medical men, by whom the doctrine of the circulation was long treated as a heresy in science, and its discoverer nearly persecuted out of the profession. That his disposition was generous and friendly in a remarkable degree is beyond doubt, and the reader may find a striking instance of it in the life of Ruddiman.

Dr. Pitcairne died in Edinburgh on the 20th of October, 1713, in the sixty-first year of his age, and was interred in the Grayfriars' Churchyard.

PITSLIGO, LORD. *See* FORBES (ALEXANDER).

PLAYFAIR, JOHN, an eminent natural philosopher and mathematician, was the eldest son of James Playfair, minister of Benzie, in Forfarshire, where he was born on the 10th of March, 1748. He was educated at home until he reached the age of fourteen, when he was sent to the university of St. Andrews, where it was intended that he should study for the Scottish church. The precocity of talent exhibited by great men, frequently so ill authenticated, has been strikingly vouched by two remarkable circumstances in the early history of Playfair. While a student at St. Andrews, Professor Wilkie, the author of the *Epigonial*, when in bad health selected him to deliver lectures on natural philosophy to the class; and in the year 1766, when only eighteen years of age, he felt himself qualified to compete as a candidate for the chair of mathematics in the Marischal College of Aberdeen. In this his confidence in his powers was justified by the event. Of six candidates, two only excelled him—Dr. Trail, who was appointed to the chair, and Dr. Hamilton, who afterwards succeeded to it.¹

In 1769, having finished his courses at the university, Mr. Playfair lived for some time in Edinburgh, in the enjoyment of the very select literary society of the period. "It would appear," says his biographer,² "from letters published in the *Life of the Late Principal Hill*, that, during this time, Mr. Playfair had twice hopes of obtaining a permanent situation. The nature of the first, which offered itself in 1769, is not there specified, and is not known to any of his own family; the second was the professorship of natural philosophy in the university of St. Andrews, vacant by the death of his friend Dr. Wilkie, which took place in 1772. In this, which he earnestly desired, and for which he was eminently qualified, he was disappointed." During the same year his father died, and the care of his mother, and of the education of his father's young family, rendered the acquisition of some permanent means of livelihood more anxiously desirable. He was immediately nominated by Lord Gray to his father's livings of Liff and Benzie; but the right of presentation being disputed, he was unable to enter on possession until August, 1773. From that period his time was occupied in attending to the duties of his charge, superintending the education of his brothers, and prosecuting his philosophical studies. In 1774 he made an excursion to Perthshire, to witness the experiments of Dr. Maskelyne, the astronomer royal, to

illustrate the principles of gravitation from the effect of mountains in disturbing the plumb-line. A permanent friendship was at that time formed between the two philosophers. "I met," says Playfair, in his journal of a visit to London in 1782, "with a very cordial reception from him (Dr. Maskelyne), and found that an acquaintance contracted among wilds and mountains is much more likely to be durable than one made up in the bustle of a great city: nor would I, by living in London for many years, have become so well acquainted with this astronomer, as I did by partaking of his hardships and labours on Schehallien for a few days."

In 1779 Playfair's first scientific effort was given to the public in an *Essay on the Arithmetic of Impossible Quantities*, published in the sixty-eighth volume of the *Philosophical Transactions*. In 1782 an advantageous offer prompted him to give up his living, and become tutor to Mr. Ferguson of Raith, and his brother Sir Ronald Ferguson. It was at this period that he paid the visit to London in which he met Dr. Maskelyne. By that gentleman he was introduced to some literary men, and to institutions of literary or philosophical interest. Some of these roused the calm enthusiasm for philosophical greatness which was one of the principal features of his character. "This," he says, "was the first time that I had seen the observatory of Greenwich, and I entered with profound reverence into that temple of science, where Flamstead, and Halley, and Bradley devoted their days and their nights to the contemplation of the heavens. The shades of these ancient sages seemed still to hover round their former mansions, inspiring their worthy successor with the love of wisdom, and pointing out the road to immortality."

From his thirst after knowledge being untainted by political or local prejudices, Playfair had early turned himself to the important discoveries of the continental algebraists, and was the first man of eminence to introduce them to British notice. He perceived the prejudices entertained on the subject in England, and probably the discovery sharpened his appetite for a subject which he found was almost untouched. Speaking of Dr. Maskelyne, he says, "He is much attached to the study of geometry, and I am not sure that he is very deeply versed in the late discoveries of the foreign algebraists. Indeed, this seems to be somewhat the case with all the English mathematicians: they despise their brethren on the Continent, and think that everything great in science must be for ever confined to the country that produced Sir Isaac Newton." In the works of an eminent natural philosopher one may search long before he will find anything which shows in explicit terms the exact discipline of mind or system of reasoning by which he has made it to happen that all he has said has so much the appearance of being truth; but a petty remark, disconnected with the ordinary pursuits of the philosopher, may often strikingly illustrate the operation of his mind, and the means by which he has disciplined himself to approach as near as possible to truth; and such a passage occurring in this short diary, we beg to insert it. "An anecdote of some Indians was told, that struck me very much as holding up but too exact a picture of many of our theories and reasonings from analogy. Some American savages having experienced the effects of gunpowder, and having also accidentally become masters of a small quantity of it, set themselves to examine it, with a design of finding out what was its nature and how it was to be procured. The oldest and wisest of the tribe, after considering it attentively, pronounced it to be a seed. A piece of ground was accordingly prepared

¹ See life of ROBERT HAMILTON in this Collection.

² His nephew, by whom a *Life of Mr. Playfair* was prefixed to an edition of his works, published in 1822.

for it, and it was sown, in the fullest confidence that a great crop of it was to be produced. We smile at the mistake of these Indians, and we do not consider that, for the extent of their experience, they reasoned well, and drew as logical a conclusion as many of the philosophers of Europe. Whenever we reason only from analogy and resemblance, and whenever we attempt to measure the nature of things by our conceptions, we are precisely in the situation of these poor Americans." In this Playfair exemplified the propensity to reason from certain qualities perceived to be identical, when it is not known but that other qualities not perceived may be at variance. The wise American saw colour and form like those of a seed, and from these he drew his conclusion. Had he been a botanist he would have discovered that the grain consisted of saltpetre and charcoal, instead of kernel; and whatever else he could have made of it, he would have quickly perceived that it was not a seed. In connection with this it is to be held in mind that Playfair was essentially a reasoner, and that he was more celebrated for separating the true from the false in the writings of others, or for establishing and applying truths accidentally stumbled upon by others, than for extensive discoveries of his own.

In 1785 Dr. Adam Ferguson exchanged the moral chair in the university for that of mathematics, taught by professor Dugald Stewart, and, being in bad health, chose Playfair as his assistant. He continued, however, to attend his two pupils until 1787, when he took up his residence with his mother, who had for some time lived in Edinburgh. He now commenced a series of papers which appeared in the *Transactions* of the Royal Society of Edinburgh. The first of these was the "Life of Dr. Matthew Stewart," the late professor of mathematics in the university of Edinburgh; a paper written in his usual flowing, simple, and expressive style. A second was a paper on the "Causes which affect the Accuracy of Barometrical Measurements." A third was "Remarks on the Astronomy of the Brahmins." The early Eastern astronomy was a subject to which he was very partial, and to which some conceive he has paid more attention than its importance warranted. He fought to a certain extent at disadvantage, from ignorance of the language, and consequently of external evidence as to the authenticity of the remarkable records containing the wisdom of the Brahmins; but he calculated their authenticity from the circumstance, that none but a European acquainted with the refinements of modern science could have made the calculations on which they might have been forged. The death of his brother James, in 1793, interrupted his philosophical pursuits, by forcing on his management some complicated business, along with the education of his brother's son. In 1795 he published an edition of Euclid's *Elements* for the use of his class. In this work he adopted the plan of using algebraic signs instead of words, to render the proportions more compact and apparent. The plan has been repeatedly practised since that period, and Playfair's *Euclid* is a book well known to the boys in most mathematical schools, by whom, however, it is not always so much admired as it is known. In 1797 he suffered a severe attack of rheumatism, during which he sketched an essay on the accidental discoveries which have been made by men of science whilst in pursuit of something else, or when they had no determinate object in view; and wrote the observations on the trigonometrical tables of the Brahmins, and the theorems relating to the figure of the earth, which were afterwards published in the *Transactions*

of the Royal Society of Edinburgh. About the same time his friend Dr. Hutton died, and Playfair, who affectionately intended to have written his memoir, found in the study of his works a vast field in which he afterwards distinguished himself, by the preparation of the *Illustrations of the Huttonian Theory of the Earth*. Few observers of nature have possessed the power of describing what they have seen, so as to make their facts and deductions perceivable to ordinary thinkers. Playfair possessed the quality, however, to a rare extent; and it was probably its deficiency in the works of his friend Hutton which prompted him to prepare the elegant and logical *Analysis of the Volcanic Theory of the Earth*, which has been so much admired for its own literary merits, and has been the means of rendering popular an important theory which otherwise might have remained in obscurity. It has been said, that the illustration of a theory of the earth was but a profitless employment for so accurately thinking a philosopher, and that the task might have been left to more imaginative minds, whose speculations would have afforded equal pleasure to those who delight in forming fabrics of theory on insufficient foundations. It is true, that even the lucid commentary of Playfair does not establish the Huttonian as a general and undeviating theory, in an undoubted and indisputable situation; he seems not to have aimed so high; and from the present state of science, no one can predicate that the elementary formation of the earth, or even of its crust, will ever be shown with chemical exactness. All that can be said is, that in as far as the respective experiments and deductions of the theorists have proceeded, the Huttonian theory is not directly met by any fact produced on the part of the Neptunians, and the phenomena produced in its favour strongly show—indeed show to absolute certainty in some cases—the present formation of a great part of the crust of the earth to have been the effect of fire, how operating in respect to the whole substance of the globe it is impossible to determine.

The defence of a theory of the earth had for some time been unpopular among many philosophers, from the production of such majestic fabrics of theory as those of Whiston and Burnet, which, without a sufficient number of ascertained facts for the analysis of the component parts of any portion of the earth's surfaces, showed in detail the method of its abstraction from the rest of the universe, and the minutiae of its formation. But Playfair never went beyond rational deduction on the facts which were known to him, limiting the extent of his theories to reasonings on what he knew; and it shows the accuracy of his logic, that, while the experiments of Sir James Hall and others (which were in progress but not complete while he wrote), have tended to support his explication, especially in justifying his opinion that the reason of calcination in bodies subjected to heat was the necessity of the escape of the gases contained in them, we are aware of none which have contradicted him.

The period between 1797 and 1802 was occupied by Mr. Playfair in preparing his *Illustrations*, and in 1803 his biographical sketch of Hutton was published in the Society's *Transactions*. In 1805 he quitted the mathematical chair, and succeeded Professor John Robison in that of natural philosophy; during the same year his mother died at the age of eighty-five, and he retired, along with a younger brother, his youngest sister, and two nephews, to Burntisland, that he might devote the summer to uninterrupted preparation for the duties of his new class. In the controversy with the clergymen of Edinburgh regarding his successor to the chair of

mathematics, he took an active part. A letter which he addressed to the provost of Edinburgh, in favour of the election of a *scientific* man, as opposed to a clergyman, was answered by Dr. Inglis, and from the nature of the remarks directed against himself, he considered it necessary to reply. The pamphlet produced under these circumstances, showed that his calm temper might be made dangerous by interference: it is written in considerable asperity of spirit, but without vulgar raillery or much personality, and the serious reproof, mixed with occasional sarcasm, which it contains, shows great power to wield the weapons of literary warfare. He next occupied himself in preparing papers on the solids of greatest attraction, and on the progress of heat in spherical bodies, which appeared in the *Transactions* of the Royal Society of Edinburgh. He also presented to the London Royal Society, of which he was admitted a member in 1807, an *Account of the Survey of Schehallien*. In 1814 he published for the use of his students his well-known *Outlines of Natural Philosophy*, in two volumes octavo. The first volume of this work treats of dynamics, mechanics, hydrostatics, hydraulics, aerostatics, and pneumatics. The second is devoted to astronomy. A third volume was intended to have embraced optics, electricity, and magnetism; but the work was never completed. In the following year he presented to the Royal Society of Edinburgh a life of his predecessor, Professor Robison. His labours for this institution will be perceived to have been very extensive, and they show him not to have been a mercenary man. He was long its chief support, arranging and publishing the *Transactions*, and gratuitously acting as secretary. In 1816 he published, in the *Supplement to the Encyclopædia Britannica*, a "Dissertation on the Progress of Mathematical and Physical Science since the Revival of Letters in Europe," a work of great erudition and research. This work interrupted a new and much altered edition of his *Illustrations of the Huttonian Theory*, which he had previously designed, but which unfortunately he was never enabled to complete. "It was intended," says his biographer, "to commence with a description of all the well-authenticated facts in geology collected during his extensive reading and personal observation, without any mixture of hypothesis whatever. To this followed the general inferences which may be deduced from the facts, an examination of the various geological systems hitherto offered to the world, and the exclusion of those which involved any contradiction of the principles previously ascertained; while the conclusion would have presented the development of the system adopted by the author, and the application of it to explain the phenomena of geology." Previously to 1815 Mr. Playfair had confined his geological observations to Britain and Ireland; nor was he able, from causes public or private, previously to that period, to extend them to the Continent. His nephew accompanied him on a tour which he designed to extend as far as he could through Italy, Switzerland, and France. He spent a short time in the philosophical circle of Paris, to which his name could not fail to be an introduction. He then passed to Switzerland, and commenced the most important of his geological notices at Mount Jura, where he found blocks of granite, gneiss, and mica-slate lying loosely on the surface of mountains whose solid substance was entirely calcareous. At Lucerne and Chamouni he was prevented by adverse weather from making his intended searches among the interior valleys. Towards winter he was about to return, when he received a letter from the provost of Edinburgh, inti-

imating that the patrons of the university permitted his absence during the ensuing session—a circumstance which enabled him to prolong his tour a whole year. After remaining for a month at Geneva, he entered Italy by the Simplon. In the *Accademia del Cimento* at Florence, his enthusiasm for philosophical history was gratified by an inspection of the instruments made by Galileo, among which was the original telescope, made of two pieces of wood, coarsely hollowed out, and tied together with thread. On the 12th of November he set out for Rome, which he reached on the 18th. There he remained during the winter, occupying himself with researches in the Vatican library, such geological observations as the neighbourhood afforded, and the select English society always to be found in the imperial city, among whom he found many of the friends he had met in England. After the termination of the winter he went to Naples, where a wider field for geological observation lay before him. The observations which he made on this part of his route, not so much connected with the action of the volcano as with the state of the surrounding country, are embodied in some interesting notes, an abstract of which may be found in the memoir above referred to; but it is to be regretted that the amount of so much accurate observation was not brought to bear on his *Analysis of the Theory of the Earth*. Mr. Playfair returned to Rome, whence, after a second visit to Florence, he proceeded, by such gradations as enabled him accurately to observe the mineralogy of the country, to Geneva. While travelling through Switzerland, he visited and prepared a short but curious account of the Slide of Alpnach, by which trees are conveyed from the sides of Pilatus into the Lake of Lucerne, whence they proceed through the Aar to the Rhine. On his return he passed through Venice, Lyons, and Paris. In the ensuing summer he retired to Burnt-island, where he prepared a memoir on *Naval Tactics*, in illustration of the discoveries of Clerk of Eldin, which was published after his death. He had intended to publish in detached papers his observations on the remarkable objects of his tour, and to have prepared his *Illustrations of the Huttonian Theory of the Earth*, but he lived scarcely long enough to commence these labours. For some years he had been afflicted with a strangury, which alarmingly increased in the month of June, 1819, and he died on the ensuing 19th of July. He was buried on the 26th, when the members of the Royal Medical Society, and a numerous body of public and private friends, followed him to the grave.

The literary and domestic character of this great and excellent man have been drawn by Francis Jeffrey, with whom, as the writer of many papers in the *Edinburgh Review*, Mr. Playfair must have been on an intimate footing. The former part of the subject is open for the appreciation of the world, but as the latter can only be told by one acquainted with it, we beg to extract a portion. "The same admirable taste which is conspicuous in his writings, or rather the higher principles from which that taste was but an emanation, spread a similar charm over his whole life and conversation, and gave to the most learned philosopher of his day the manners and deportment of the most perfect gentleman. Nor was this in him the result merely of good sense and good temper assisted by an early familiarity with good company, and a consequent knowledge of his own place and that of all around him. His good-breeding was of a higher descent; and his powers of pleasing rested on something better than mere companionable qualities. With the greatest kindness and generosity of nature he united the most manly firmness and the

highest principles of honour; and the most cheerful and social dispositions with the gentlest and steadiest affections. Towards women he had always the most chivalrous feelings of regard and attention, and was, beyond almost all men, acceptable and agreeable in their society, though without the least levity or pretension unbecoming his age or condition. And such, indeed, was the fascination of the perfect simplicity and mildness of his manners, that the same tone and deportment seemed equally appropriate in all societies, and enabled him to delight the young and the gay with the same sort of conversation which instructed the learned and the grave. There never, indeed, was a man of learning and talent who appeared in society so perfectly free from all sorts of pretension or notion of his own importance, or so little solicitous to distinguish himself, or so sincerely willing to give place to every one else. Even upon subjects which he had thoroughly studied, he was never in the least impatient to speak, and spoke at all times without any tone of authority; while so far from wishing to set off what he had to say by any brilliancy or emphasis of expression, it seemed generally as if he had studied to disguise the weight and originality of his thoughts under the plainest form of speech, and the most quiet and indifferent manner; so that the profoundest remarks and subtlest observations were often dropped, not only without any solicitude that their value should be observed, but without any apparent consciousness that they possessed any."

PLAYFAIR, WILLIAM, an ingenious mechanic and miscellaneous writer, brother to the preceding, was born in the year 1759. The personal history of this man when compared with that of his brother, shows in striking colours the necessity, not only of industry, but of steadiness and consistency of plan, as adjuncts of genius in raising its possessor to eminence. Being very young when his father died, his education was superintended by his brother. His early taste for mechanics prompted his friends to place him as apprentice to a mill-wright of the name of Mickle. He afterwards went to England, and in 1780 was engaged as draughtsman in the service of Mr. James Watt. How long he remained in this situation we do not know, but the vast mass of pamphlets which he was unceasingly producing must have speedily interfered with his professional regularity, and he seems to have spent the remainder of his days in alternately making mechanical discoveries of importance, and penning literary or political pamphlets. Among the most useful of his mechanical efforts was the unrequited discovery of the French telegraph, gathered from a few partial hints, and afterwards adapted by an alphabet of his own invention to British use. At the period when he was most busy as a writer, he received no less than five patents for new inventions; one of these was for the manufacture of sashes, constructed of a mixture of copper, zinc, and iron. These he termed Eldorado sashes. Another was for a machine for completing the ornamental part of fretwork on small implements of silver and other metal; such as sugar-tongs, buckles, &c., which had previously been executed by the hand. For some time he occupied a silversmith's shop in London, but, tiring of the business, or finding it unprofitable, he proceeded to Paris, where, among other mechanical speculations, he procured an exclusive privilege for the manufacture of a rolling-mill on a new plan. While living in Paris, he was the means of forming the colony of Scioto in America. Having formed an acquaintance with Mr. Joel Barlow, who had been sent to Paris

to negotiate the disposal by lots of 3,000,000 of acres which had been purchased by a company at New York, on the banks of the Scioto, he undertook to procure for him the necessary introductions, and to conduct the disposal. The breaking out of the French revolution favoured the scheme. It was proposed that the lands should be disposed of at 5s. per acre, one half to be paid at signing the act of sale, the other to remain on mortgage to the United States, to be paid within two years after taking possession. In less than two months 50,000 acres were sold, and two vessels sailed from Havre de Grace, with the nucleus of the colony. Soon after accomplishing this project, he made a narrow escape from being arrested by the revolutionary government, a fate which his strongly expressed objections to the French revolution rendered a very likely event. On his return to London he projected a bank termed the Security Bank; its object was the division of large securities so as to facilitate small loans;—this bank unfortunately belied its name, and became insolvent, too little attention having been paid to the securities taken. On the restoration of the Bourbons he returned to France, and became editor of *Galvani's Messenger*, but he was driven back to England by a libel prosecution, and continued to gain his subsistence by essay-writing and translating. His works being in general connected with the passing politics of the day, need not be all named and characterized. In books and pamphlets his distinct works are said to amount to about a hundred. Several were politico-economical in their subject, discussing the sinking-fund, the resources of France, the Asiatic establishments of Britain, the prospects of the manufacturing interest, &c. His political remarks were generally for the purpose of supporting and vindicating the conduct of Britain towards France, and received the designation "patriotic." Among his principal publications were a *History of Jacobinism*, published in 1795; an edition of Smith's *Wealth of Nations*, with notes, in 1806; and *British Family Antiquities*, in 9 vols. 4to, published in 1809-11. This last work forms a peerage and baronetage of Britain and Ireland. It contains a great mass of matter, and is splendidly illustrated, but it is not looked on by genealogists as a work of much authority. He spent the last days of his laborious but irregular life without the competence which well-directed talent generally acquires, and his death was hurried on by anxiety of mind. He died in Covent Garden on the 11th February, 1823, in the sixty-fourth year of his age. "In private life," says a biographer, "Mr. Playfair was inoffensive and amiable; not prepossessing in his appearance and address, but with a strong and decided physiognomy, like that of his late brother. With a thoughtlessness which is too frequently allied to genius, he neglected to secure that provision for his family which from his talents they were justified to expect; and although he laboured ardently and abundantly for his country, yet he found it ungrateful, and was left in age and infirmity to regret that he had neglected his own interests to promote those of the public."¹

POLLOK, ROBERT, author of the *Course of Time*, a poem, was born in 1799, of respectable parents, at Muirhouse, in the parish of Eaglesham, Renfrewshire. After acquiring the rudiments of a classical education in the country, he passed through a regular course of literary and philosophical study at the university of Glasgow. Having sustained the ordinary previous presbyterial examinations, he was admitted

¹ *Annual Obituary*, 1824, 460.

to the divinity hall under the superintendence of the Rev. Dr. Dick of Glasgow, who at that time was sole professor of theology in the United Secession Church. On finishing his course of five years' study under this accomplished tutor, he was, by the United Associate presbytery of Edinburgh, licensed to preach the gospel in the spring of 1827. The only time he ever preached was in the chapel of Dr. John Brown in Rose Street, Edinburgh.

A short time before receiving license to preach he had prepared his poem, the *Course of Time*, which extends to ten books in blank verse, and describes the mortal and immortal destiny of man, in language the nearest perhaps to that of Milton which has ever been employed by a later bard. It has rarely happened that one so young has completed any work so extensive as this, much less one so successful; and we may be allowed to surmise that the man who could form and execute such a design at such a period of life, must have possessed not only an intellect of the first order of power, but a character of the first order of strength. On the recommendation of the late celebrated John Wilson, professor of moral philosophy in the university of Edinburgh, the *Course of Time* was published by Mr. Blackwood early in 1827. Of the earlier attempts of Mr. Pollok in prose and verse little is known. He wrote three tales relative to the sufferings of the persecuted Presbyterians of the reign of Charles II., which were published anonymously in his lifetime, and have since been reprinted with his name. They are manifestly juvenile and hasty productions; but they are the juvenile and hasty productions of a man of genius. The labour of preparing his poem for publication and carrying it through the press appears to have fatally impaired a constitution originally vigorous. Soon after his license symptoms of pulmonary disease having become distinctly apparent, he spent the greater part of the summer of that year with the Rev. Dr. Belfrage of Slateford, under whose hospitable roof he enjoyed every advantage which medical skill, called forth into active exertion by cordial friendship, could furnish.

As the disease seemed obviously gaining ground, it was suggested by Dr. Abercromby and other eminent physicians that a removal to a more genial climate, during the approaching winter, was the only probable means of protracting a life so full of promise. It was therefore resolved on that he should, with as little delay as possible, set out for Italy; and the means for prosecuting such a journey were readily supplied by the admirers of his genius.

In the commencement of autumn he left Edinburgh, accompanied by a sister, and travelled by a steam-vessel to London. During the short time he remained in that city, he resided at Camberwell with the late John Pirie, Esq., afterwards lord-mayor of London, to whom he had been introduced by a common friend, and who with characteristic generosity made every exertion to contribute to his comfort, and ceased not to take a deep interest in his happiness till he was called on to commit his remains to the grave.

After arrangements had been made for his voyage to Italy, his medical advisers in London, fearing that he would never reach that country, recommended his immediate removal to the south-west of England, and the neighbourhood of Southampton was fixed on as a suitable situation. Having arrived there he took up his residence on Shirley-Common. His disease continued to make progress, and in the course of a few weeks he fell a victim to its power, on the 15th of September, 1827. "He died," says his biographer, "in the faith of the gospel and in the hope of eternal life."

He is buried in the churchyard of Millbrook, the parish in which Shirley-Common lies. Those admirers of his genius who would fain have prolonged his life, have perpetuated their regard for him, by erecting an obelisk of Peterhead granite over his grave, bearing, with the dates of his birth and death, the following simple inscription:—

THE GRAVE

OF

ROBERT POLLOK, A.M.
AUTHOR OF "THE COURSE OF TIME,"
HIS IMMORTAL POEM IS HIS
MONUMENT.

Such is a "faithful chronicle" of the principal external events in the short life of Robert Pollok. Of the most important inward revolution of which man's little world is susceptible, that change without which a man "cannot enter the kingdom of God," he has given the following most impressive account in the *Course of Time*. It is one of the most interesting fragments of autobiography we have ever met with, and compensates, in some measure, for the meagreness of the present sketch; which, imperfect as it is, seems all that circumstances will permit to be gathered together respecting Pollok. The extract, though perhaps rather too long for such a purpose, will also serve as a specimen of the poetry produced by the subject of our memoir. It will remind many readers of some passages of a similar kind, of exquisite beauty, in Cowper.

"One of this mood I do remember well,
We name him not, what now are earthly names?
In humble dwelling born, retired, remote;
In rural quietude, 'mong hills, and streams,
And melancholy deserts, where the sun
Saw, as he passed, a shepherd only, here
And there, watching his little flock, or heard
The ploughman talking to his steers; his hopes,
His morning hopes, awoke before him, smiling,
Among the dews and holy mountain airs;
And fancy coloured them with every hue
Of heavenly loveliness. But soon his dreams
Of childhood fled away, those rainbow dreams
So innocent and fair, that withered Age,
Even at the grave, cleared up his dusty eye,
And passing all between, looked fondly back
To see them once again, ere he departed:
These fled away, and anxious thought, that wished
To go, yet whither knew not well to go,
Possessed his soul, and held it still awhile.
He listened, and heard from far the voice of fame,
Heard and was charmed: and deep and sudden vow
Of resolution made to be renowned;
And deeper vowed again to keep his vow.
His parents saw, his parents whom God made
Of kindest heart, saw, and indulged his hope.
The ancient page he turned, read much, thought much
And with old bards of honourable name
Measured his soul severely; and looked up
To fame, ambitious of no second place.
Hope grew from inward faith, and promised fair.
And out before him opened many a path
Ascending, where the laurel highest waved
Her branch of endless green. He stood admiring;
But stood, admired, not long. The harp he seized,
The harp he loved, loved better than his life,
The harp which uttered deepest notes, and held
The ear of thought a captive to its song.
He searched and meditated much, and whiles,
With rapturous hand, in secret, touched the lyre,
Aiming at glorious strains; and searched again
For theme deserving of immortal verse;
Chose now, and now refused, unsatisfied;
Pleased, then displeased, and hesitating still.

"Thus stood his mind, when round him came a cloud,
Slowly and heavily it came, a cloud
Of ills we mention not: enough to say
'Twas cold, and dead, impenetrable gloom.
He saw its dark approach, and saw his hopes,
One after one, put out, as nearer still
It drew his soul; but fainted not at first,
Fainted not soon. He knew the lot of man
Was trouble, and prepared to bear the worst;
Endure what'er should come, without a sigh;
Endure, and drink, even to the very dregs,
The bitterest cup that time could measure out:
And having done, look up, and ask for more.

"He called philosophy, and with his heart Reasoned. He called religion too, but called Reluctantly, and therefore was not heard. Ashamed to be o'ermatched by earthly woes, He sought, and sought with eye that dimmed apace, To find some avenue to light, some place On which to rest a hope; but sought in vain. Darker and darker still the darkness grew. At length he sunk, and Disappointment stood His only comforter, and mournfully Told all was past. His interest in life, In being, ceased: and now he seemed to feel, And shuddered as he felt, his powers of mind Decaying in the spring-time of his day. The vigorous, weak became; the clear, obscure; Memory gave up her charge; Decision reeled: And from her flight, Fancy returned; returned Because she found no nourishment abroad. The blue heavens withered; and the moon, and sun, And all the stars, and the green earth, and morn And evening, withered; and the eyes, and smiles, And faces of all men and women, withered, Withered to him; and all the universe, Like something which had been, appeared, but now Was dead and mouldering fast away. He tried No more to hope; wished to forget his vow, Wished to forget his harp; then ceased to wish. That was his last; enjoyment now was done. He had no hope; no wish, and scarce a fear Of being sensible, and sensible Of loss, he as some atom seemed, which God Had made superfluously, and needed not To build creation with; but back again To nothing threw, and left it in the void, With everlasting sense that once it was.

"Oh! who can tell what days, what nights he spent, Of tideless, waveless, sailless, shoreless woe? And who can tell how many, glorious once, To others and themselves of promise full, Conducted to this pass of human thought, This wilderness of intellectual death, Wasted and pined, and vanished from the earth, Leaving no vestige of memorial there.

"It was not so with him. When thus he lay, Forlorn of heart; withered and desolate As leaf of Autumn, which the wolfish winds, Selecting from its falling sisters, chase, Far from its native grove, to lifeless wastes, And leave it there alone, to be forgotten Eternally, God passed in mercy by— His praise be ever new!—and on him breathed, And bade him live, and put into his hands A holy harp, into his lips a song, That rolled its numbers down the tide of Time, Ambitious now but little to be praised Of men alone; ambitious most to be Approved of God, the Judge of all: and have His name recorded in the book of life."

The *Course of Time* was only beginning to attract attention at the time when its author's ear was about to be closed, alike to the voice of censure and praise. Almost immediately after his death, it became extensively read throughout the British empire, especially among the numerous and respectable classes of dissenters. It has, accordingly, passed through a considerable number of editions, and now appears likely to keep its place among the standard poems in our language. A portrait of the author was obtained by the Rev. Dr. John Brown, of Edinburgh, before his departure for London, and has been engraved. It conveys the impression of deep and grave intelligence, such as might have been expected from the author of the *Course of Time*.¹

PONT, ROBERT, a churchman, judge of the Court of Session, and political and scientific writer of some eminence, was born at Culross, cir. 1524-30, of honourable if not noble parentage.² After receiv-

¹ This article is copied (by permission), with a few slight additions, from the preface to "*Tales of the Covenanters*," by Robert Pollok, A.M., Edinburgh: W. Oliphant, 1832.

² Mr. Crichton (*Life of Mr. F. Blackader*, p. 15, note) says that his father, John du Pont, or da Ponte, was a noble Venetian; that he was banished his country for professing the Reformed religion, and came over to Scotland in the train of Mary of Guise, queen of James V. This statement seems

ing his elementary education at the school of his native place, he was in 1543 incorporated a student of St. Leonard's College in St. Andrews, where he prosecuted the study of philosophy and divinity with great success. From the period of his leaving the university no notice of him has been discovered till 1559, when he is mentioned as an elder in the kirk-session record of St. Andrews. His intimate knowledge of law renders the supposition probable, that the interval was employed in that branch of study at some of the Continental universities. He seems to have early allied himself to the Protestant party. He was an elder of St. Andrews from a very early period, and attended, as one of the commissioners from that place, the first General Assembly, by which he was declared qualified for ministering and teaching. In the year 1563 he competed for the office of superintendent of the diocese of Galloway. He appears to have failed in the attempt, but was shortly after appointed commissioner of the diocese of Moray. In 1566 he published, with the sanction and command of the General Assembly, a *Translation and Interpretation of the Helvetic Confession*. In January, 1571, he was, through the same influence, appointed to the provosty of Trinity College, Edinburgh, and afterwards to the vicarage of St. Cuthbert's Church. At the same period he followed the directions of his party by excommunicating the Bishop of Orkney, who had performed the marriage ceremony to Mary and Bothwell. Policy at this time dictated that the judicial dignities which had been conferred on the Roman Catholic churchmen should be extended to the new church, of which the members, while their general principles were rather averse to the system, possessed some share of personal ambition, and in 1571 the regent proposed that Pont should be appointed a senator of the College of Justice. The zealous churchman declined acceptance without the sanction of the assembly, and on the 12th January, 1572, that body gave license "to the said Mr. Robert to accept and use the said place of a senator in the said College of Justice, what tyme he shall be required thereto, providing allwayes, that he leave not the office of the ministrie, but that he exercise the same as he should be appointed to the kirke, and this their license to the said Mr. Robert to be no preparative to no other minister to procure sic promotione, unless the kirke's advyse be had of before, and license obtained thereunto." The natural consequence of such an appointment seems to have taken place, and in the following year he was charged with neglect of duty in non-residence, and not sufficiently visiting the churches in Moray, an accusation to which he very naturally pleaded want of leisure from the pressure of his new duties.

In 1574 Mr. Pont was appointed colleague to William Harlaw, minister of St. Cuthbert's Church, Edinburgh. He was now employed in all the more important business of the church: he was appointed, in 1574, to revise all books that were printed and published; about the same period he drew up the calendar, and rules for understanding it, for Arbutnot and Bassandyn's edition of the Bible; and he was engaged in the preparation of the Second Book of Discipline. In 1582 he was invited to become minister of St. Andrews, and seems to have accepted the appointment, but he was soon obliged to abandon it; for at the General Assembly, held in April, 1583, he declared that, "with losse of his

irreconcilable with his son having been born at Culross at the time above mentioned. (Buchanan de Illust. Scot. Scriptori. MS. Adv. Lib.) It must also be remarked, that the name was common in Scotland long before this time.

heritage and warldlie commoditie, he had proponit to sit down in St. Andrews, and had served at his awin charges ane hailt yair, and culd not haif any equall condition of leving, na not the least provision." He accordingly returned to his charge at the West Church. In 1584, when James struck a blow at the church, by rendering it criminal to decline the jurisdiction of the privy-council, and to hold assemblies without the royal permission, Pont added his name to the list of the gallant defenders of the church, by solemnly protesting against the acts as they were published at the cross of Edinburgh, on the ground that they had been passed without the knowledge or consent of the church. Two days before (23d May, 1584) he had been deprived of his seat in the College of Justice, by an act prohibiting ecclesiastics to hold civil appointments, and he now, with many of the clergy who were alarmed at so bold an inroad, fled to England. He returned to Scotland with the Earl of Angus and his party a few months afterwards, and resumed his ministerial duties. In 1587 he was nominated to the bishopric of Caithness; but the assembly refused to ratify the appointment. In 1591 the assembly appointed him to write against sacrilege; his three sermons on that subject were approved of, and ordered to be printed by the presbytery of Edinburgh, November 12, 1594 (see *Records*), but from some unknown cause were not published till 1599. In 1594 he published *A New Treatise on the Right Reckoning of Years and Ages of the World*, for the purpose of showing that the year 1600 was not, as his countrymen supposed, the proper year of the jubilee. In 1601 he was appointed by the General Assembly to revise the Psalms. In 1596 and 1602 he was chosen commissioner of Orkney, and his name was first in the list of those who were intended for the qualified prelates. In 1604 he published a tract on the union of the kingdoms, "De Unione Britannice, seu de Regnorum Angliæ et Scotiæ omniumque adjacentium Insularum in unam Monarchiam consolidandæ, deque multiplici ejus Unionis utilitate, Dialogus." Mr. Fraser Tytler, who appears to have perused it, says,¹ "This political treatise, which is written in Latin in the form of a dialogue between three fictitious speakers, Irenæus, Polyhistor, and Hospes, is chiefly valuable from its furnishing us with some curious pictures of the political state of the country, and the rude manners of the times. . . . The picture he presents of the intolerable tyranny of the nobles in their strong and remote fortresses, of the impotency of the arm of the law, and the personal terrors of the judges, who trembled before these petty princes, very completely proves that there was no poetical exaggeration in the verses of Sir Richard Maitland." Pont died on the 8th May, 1606, and was interred, it is said, in the church of St. Cuthbert, where a monument was erected to his memory, with an epitaph, partly in English, partly in very questionable Latin. He had prepared a more ample edition of his work on the Jubilee Year, which was published in quarto, in 1619.² Besides these works Pont wrote *Chronologia de Sabbatis*, published at London in 1626. His *Aureum Seculum*, his *Translation of Pindar's Olympic Odes*, his *Dissertation on the Greek Lyric Metres*, his *Lexicon of Three Languages*, and *Collection of*

Homilies, all of which David Buchanan says he saw in MS., are now nowhere to be found.

PONT, TIMOTHY, the celebrated geographer who prepared the "Theatrum Scotiæ," in Bleau's *Atlas*, was the eldest son of the preceding, apparently by his first wife, Catharine Masterton, daughter of Masterton of Grange. Scarcely anything of his personal history appears to be known. He seems to have become a minister of the Scottish church, and is mentioned in the Book of Assignations, 1601-8, as "minister of Dwnet."³ Sir Robert Sibbald (*De Histor. Scot.* MS. Ad. Lib. p. 2) mentions a pedestrian expedition undertaken by him, in 1608, to explore the more barbarous parts of the country. "He was," says Bishop Nicholson, "by nature and education a complete mathematician, and the first projector of a Scotch atlas. To that great purpose he personally surveyed all the several counties and isles of the kingdom; took draughts of 'em upon the spot, and added such cursory observations on the monuments of antiquity and other curiosities as were proper for the furnishing out of future descriptions. He was unhappily surpris'd by death, to the inestimable loss of his countrey, when he had well nigh finish'd his papers, most of which were fortunately retrieved by Sir John Scott, and disposed of in such a manner as has been already reported. There are some other remains of this learned and good man, on the 'History of Agricola's Vallum, or Graham's Dike,' as are well worth the preserving."⁴ The originals of the maps so drawn up are preserved in good order in the Advocates' Library. They are minutely and elegantly penned, and have the air of such laborious correctness, as the science of the period enabled the geographer to attain. Pont appears to have penetrated to those wild and remote portions of the island, the surfaces of which have scarcely yet been accurately delineated. Sir Robert Sibbald mentions (*De Histor. Scot.* ut supra), that after Pont's death his maps were so carelessly kept by his heirs, that they were in great danger of destruction from moths and vermin. King James ordered that they should be purchased and given to the world; but amidst the cares of government they were again consigned for a season to oblivion. At length Sir John Scott of Scotstarvet, to whose enlightened patronage we owe much of what is preserved of the literature of his times, prevailed with Sir Robert Gordon of Straloch to revise and correct them for the press. The task was continued by Sir Robert's son, Mr. James Gordon, parson of Rothemay, and with his amendments they appeared in Bleau's celebrated *Atlas*.

PRINGLE, SIR JOHN, a distinguished physician and cultivator of science, was born at Stichel House, in Roxburghshire, April 10, 1707. He was the youngest son of Sir John Pringle of Stichel, Bart., by Magdalen Elliot, sister of Sir Gilbert Elliot of Stobs. His education was commenced at home under a private tutor, and advanced at the university of St. Andrews, where he had the advantage of living with his relation, Mr. Francis Pringle, professor of Greek. Having determined on physic as a profession, he spent the winter of 1727-8 at the medical classes in Edinburgh, and afterwards proceeded to Leyden, where in 1730 he received his diploma, which was signed by the distinguished names of Boerhaave, Albinus, and Gravesande, under whom he had studied. He then settled as a physician in

⁴ *Scottish Historical Library*, 24.

Edinburgh, and in a few years had so much distinguished himself as to be, in 1734, appointed assistant and successor to the professor of pneumatics and moral philosophy in the university. He continued in this situation till 1742, when, chiefly by the influence of Dr. Stevenson (an eminent Whig physician and the patron of Dr. Blacklock), he was appointed physician to the Earl of Stair, then in command of the British army in Flanders. By the interest of this nobleman he was, in the same year, constituted physician to the military hospital in Flanders. An extensive field of observation was thus opened to Dr. Pringle; and that he cultivated it with advantage is sufficiently shown by his *Treatise on the Diseases of the Army*, subsequently published. At the battle of Dettingen he was in a coach with the minister, Lord Carteret, and at one particular crisis of the action was involved in considerable danger. On the resignation of the Earl of Stair he also proposed resigning, but was prevented by his lordship, whom he accompanied, however, forty miles on his way to England, as a mark of his respect. Having gained equal favour with the Duke of Cumberland, Dr. Pringle was, in March, 1745, appointed physician-general to the forces in the Low Countries, and physician to the royal hospitals in the same countries. He now resigned his Edinburgh professorship, the duties of which had been performed by deputy in his absence. In the latter part of the year 1745 he returned to Britain, in attendance upon the forces which were brought over to suppress the rebellion. In passing through London in October, he was chosen a fellow of the Royal Society. Early in the ensuing year he accompanied the Duke of Cumberland to Scotland, and remained with the army, after the battle of Culloden, till its return to England, in the middle of August. In 1747 and 1748 he again attended the army abroad.

After the peace of Aix-la-Chapelle, in the latter year, he settled as a physician in London, under the patronage of the Duke of Cumberland, who, in April, 1749, appointed him his physician in ordinary. In 1750 Dr. Pringle published his first work, a pamphlet on the *Ful and Hospital Fever*, hastily prepared to meet the exigency of the breaking out of that distemper in London. It was afterwards revised, and included in the work on the diseases of the army.

About this time, Dr. Pringle commenced his scientific career, by reading a series of papers to the Royal Society on septic and antiseptic substances, and their use in the theory of medicine; which procured for their author the honour of Sir Godfrey Copley's gold medal, and not only gave him reputation as an experimental philosopher, but helped to stimulate the spirit of physical inquiry, then rising into force in Britain. A great variety of other papers by Dr. Pringle are found in the *Transactions* of the society during the four ensuing years. In 1752 he married Charlotte, the second daughter of Dr. Oliver, an eminent physician in Bath; who died a few years after, leaving him no children. In the same year he published his great work on the diseases of the army, which instantly placed the author in the first rank of medical writers. In 1761 he was appointed physician to the household of the young Queen Charlotte, an honour which was followed, in rapid succession, by the appointments of physician extraordinary and physician in ordinary to her majesty. He now became an intimate and confidential person in the family of the king, who in 1766 raised him to the dignity of a baronet of Great Britain. In 1768 he was appointed physician in ordinary to the king's mother, the Princess of Wales, with a salary of £100 a year.

After having for many years acted as a member of the council in the Royal Society, he was, in November, 1772, elected president of that distinguished body; by far the highest mark of honour he ever received. It has always, on the other hand, been acknowledged that the zeal and assiduity displayed by Sir John in this situation, communicated an impulse to the exertions of the society, of which the most sensible proofs are to be found in its *Transactions* published during the years of his presidency. The last medical honour conferred on Sir John Pringle was his appointment, in 1774, as physician extraordinary to the king.

It would be tedious to repeat the list of honours showered upon him by foreign learned bodies; we shall only allude to his succeeding Linnæus, in 1778, as one of the eight foreign members of the French Academy.

Long ere this period Sir John had acquired a considerable fortune by his practice and from other sources, and lived in a style of dignified hospitality, suitable to his rank and high character. He was in the habit of holding conversations on the Sunday evenings, which were attended by men of literature and science from all countries. After passing his seventieth year, feeling his health declining, he resigned the presidency of the Royal Society, in which he was succeeded (1778) by Mr. (afterwards Sir) Joseph Banks, and formed the resolution of retiring to spend the remainder of his days in his native country. Having passed the summer of 1780 very pleasantly in Scotland, he purchased a house in Edinburgh, sold off that in which he had long resided in London, and in the spring of 1781 made a decided remove to the Scottish capital. It seems to have been the hope of the declining veteran, that he might more agreeably sink to rest amidst the friends and the scenes of his youth, than amongst strangers; and he also contemplated much pleasure in the regular evening conversations for which he intended to throw open his house. It is painful to relate that he was disappointed in his views. The friends of his youth had almost all passed away; the scenes were changed to such a degree, that they failed to suggest the associations he expected. The society of Edinburgh he found to be of too limited a nature to keep up a system of weekly conversations with the necessary degree of novelty and spirit. He also suffered considerably from the keen winds to which Edinburgh is so remarkably exposed. These evils were exaggerated by his increasing infirmities, and perhaps by that restlessness of mind, which, in the midst of bodily complaints, is still hoping to derive some benefit from a change of place. He determined, therefore, to return to London, where he arrived in the beginning of September.

Sir John Pringle did not long survive this change of residence. On the evening of the 14th of January, 1782, while attending a stated meeting of scientific friends in the house of a Mr. Watson, a grocer in the Strand, he was seized with a fit, from which he never recovered. He expired on the 18th, in the seventy-fifth year of his age, and was interred in St. James' Church. Sir John left the bulk of his fortune to his nephew, Sir James Pringle of Stichel, who also inherited from him the British baronetcy, in addition to that of Nova Scotia, which the family had previously possessed. As a physician and a philosophical inquirer, his character was of the first order; nor were his private virtues less eminent. He never grudged his professional assistance to those who could not afford to remunerate him; and he was a sincere, though liberal and rational, professor of the truths of religion. His conduct in every relation of

life was upright and honourable. He informed Mr. Boswell—and few gentlemen of that period could make such a boast—that he had never in his life been intoxicated with liquor. There is a monument to Sir John, by Nollekins, in Westminster Abbey.

PRINGLE, THOMAS. This excellent poet and miscellaneous writer was born at Blaiklaw, in Teviotdale, on the 5th of January, 1789, and was the son of a respectable farmer. In infancy he was so unfortunate as to have his hip-joint dislocated by an accident, and this evil, which might have been cured, was culpably concealed by his nurse until it was past remedy, so that he became a cripple for life, and was obliged to use crutches.

Having completed the usual course of preliminary education, Thomas Pringle was sent to the grammar-school of Kelso, and after continuing there three years he went to Edinburgh, to finish his literary training at the university. Up till this time, owing to his lameness, his life had been one chiefly of reading and contemplation, while his favourite sports were those of a stationary character—fishing, gardening, and mechanical experiments. While a student at the college, he, like most persons of an imaginative temperament, exclusively devoted himself to poetry and *belles-lettres*, to which every other acquirement was made auxiliary. At this period also his impatience of tyranny and oppression, and stout love of independence, were curiously manifested. On hearing that Joanna Baillie's play of the *Family Legend*, which was about to be produced in the Edinburgh theatre, had been previously doomed to ruin by a literary clique, and was to be strangled upon the stage, Pringle gallantly shouldered his crutch, and resolved to be the lady's champion. At the head of a body of forty or fifty young men, armed with cudgels, he took possession of the centre of the pit as soon as the doors were opened; and when the play went on, their applauding shouts, seconded by the terrific drumming of their staves, put every token of dissatisfaction to flight, and secured the success of the tragedy. It was the French mob in the gallery keeping the Convention below to rights—a remedy every whit as mischievous and unjust as the evil which it sought to cure.

As during his stay at college Pringle had been unable to settle his choice upon any of the learned professions, he betook himself on quitting it to the pursuit of literature; and as some permanent situation was necessary as a mainstay, he became a clerk in the Register Office, where his duty consisted in copying out old records, by which his mind was left unincumbered for the literary occupation of his leisure hours. The fruit of this was a poem called the *Institute*, which he published, in conjunction with a poetical friend, in 1811. It seems to have been of a satirical nature, and was abundantly lauded; but as his salary from the Register Office was a small one, he soon found that something more than mere commendation was needed. In 1816 he was a contributor to Albyn's *Anthology*, and to the *Poetic Mirror*, in the last of which he published a poem in imitation of the style of Sir Walter Scott, and of which Sir Walter declared that he wished "the original notes had always been as fine as their echo." But who can forget that benevolence and self-negation which made Scott so ready to perceive, and even to over-estimate, the excellence of others, and prefer it to his own? This poem, which appeared in the form of *An Epistle to R. S.*, brought the great poet and his successful imitator into close acquaintanceship. As Pringle's salary was still inadequate, he now set himself in earnest to literature, and resolved to start

a new periodical that should supersede the *Scots Magazine*, already worn out. His proposals were so well received that he was encouraged to relinquish his clerkship in the Register Office, with the liberty of resuming it should his plan be unsuccessful; and in 1817 the first number of his projected work appeared, under the title of the *Edinburgh Monthly Magazine*. In this work at the commencement he had for his coadjutors those who were afterwards to obtain high distinction in literature—Mr. Lockhart, Mr. Wilson, Mr. Neil, Mr. Cleghorn, Dr. Brewster, James Hogg, and the Rev. T. Wright. Mr. Pringle's own contribution was an article on the "Gipsies," the materials of which were supplied to him without solicitation by Sir Walter Scott. This spontaneous kindness on the part of the mighty minstrel and Great Unknown was the more generous, as he had intended to use these materials for an article of his own, which was to appear in the *Quarterly Review*. About the same time Pringle became editor of the *Star* newspaper, in which, besides the selection and arrangement of materials, he had to write the leading article twice a week. This, though more than enough, was not all, for in a short time the *Edinburgh Monthly Magazine* changed proprietors, and passed into the well-known title of *Blackwood's Magazine*, while Constable's was started at the same time, of which Pringle was editor also. He was thus not only the conductor of two monthly periodicals of high literary aims and expectations, but also of a half-weekly newspaper, and with such a thrice-honoured position it might have been expected that his fortunes would have thriven in some measure commensurate with his labours. But the two rival magazines could neither continue on peaceful terms, nor remain under a single editorship; and after a furious affray between their supporters, in which Pringle was handled with most unmerited roughness, he withdrew from *Blackwood's Magazine*, and attached himself to that of Constable. But the latter periodical was so unproductive, that he was fain to quit it also; and, finally, the *Star* newspaper, which had proved equally unprofitable. To add to his difficulties, he had ventured, when his prospects were most flattering, and before the battle of the magazines had commenced, to enter into marriage with Margaret Brown, daughter of a respectable East Lothian farmer. He had thus given hostages to fortune just before he was deprived of the power to redeem them, so that when the hour of payment came he was poorer than ever. His first step for extrication from his difficulties was to publish the "*Autumnal Excursion*, and other Poems;" but the poetical field at that season was so preoccupied with "Moss-troopers," "Giaours," and "Corsairs," and so hostile to "Excursions" of all kinds, from Wordsworth downwards, that Pringle's volume, though appreciated by the judicious few, brought him little or no profit. He then resumed, at the beginning of 1819, his laborious and scantily-paid drudgery at the Register Office, while his late literary compeers were rapidly advancing to fame and fortune.

Pringle's condition was now as disastrous as it well could be. He was no longer a buoyant stripling, who could be content with bread and cheese and a garret, as the mere starting-point of a race before him. The race, as it seemed, was already over, and the sun was going down while the course was but half finished. He thus found himself under a stern necessity of quitting the land of his fathers, that he might find the means of living elsewhere—a necessity as irksome to a literary Scot as it is to the literary man of any country whatever. The direction of his pilgrimage alone was in question, and that was

quickly settled. His father and four brothers, who had followed the occupation of agriculture, had been as unfortunate as himself, and were equally ready to embark with him in the bold enterprise of commencing life anew, while South Africa was at present the favourite quarter of Scottish emigration. A grant of land was soon obtained from government, at this time desirous of colonizing the unoccupied districts of the Cape of Good Hope; and Thomas Pringle, accompanied by his father, two brothers, and several friends—comprising in all twelve men, six women, and six children, embarked for the Cape in February, 1820.

Of all possible governments, that of Sancho Panza's island of Barataria not excepted, the most difficult of management, and the most prolific of political discontent and quarrel, is that of a British colony. We well know that it is neither the most contented nor the most moral of our population who leave their native land for the purpose of becoming colonists. On the contrary, every one who has made his country too hot for him—every one who hates the powers that be, and wishes to escape their restrictions—every one who dreams some impossible theory of liberty, which he hopes to realize at the greatest possible distance from the home-government—hoists sail for the new land, as if everything were to be reversed for the better the nearer he approaches the antipodes. With such a population, what system of rule short of martial law can be available? A soldier-governor is therefore commonly imposed upon our colonies; one who, having been accustomed to implicit military obedience, will have no toleration either for mutiny or murmur. In such a case the result will be misunderstanding and discontent between the ruler and the ruled. The former, while he cries, "Eyes right!" is only looked at the more askew; and while he thinks of the summary processes of the black hole or the triangles, his mutinous brigades are talking about the rights of man, the liberty of the subject, Brutus and Hampden, and Magna Charta. Such is the origin of nine-tenths of our colonial quarrels; and in most cases they may be traced to misunderstanding rather than misrule. These explanations it would perhaps be well to keep in mind, when we read of the injuries sustained by Thomas Pringle at the hands of our Cape government.

The emigrant party landed at Algoa Bay on the 5th of June, 1820, and proceeded to their location, a wild and lonely district, to which they gave the name of Glen-Lynden. It comprised 20,000 acres of land—a magnificent idea when applied to the rich fields of England, or even of Scotland, but very different in South Africa, where everything was to be grown, and where, in perhaps half the territory at least, nothing could be made to grow. Here Thomas Pringle, whose lameness precluded him from more active employment, officiated as mechanic, gardener, physician, teacher, and occasionally as chaplain, to the emigrants and their neighbours. After having remained with them till 1822, when they were comfortably settled, Pringle travelled by land for the purpose of residing at Cape Town; and during this journey his observant eye saw much of what was strange and interesting, a full account of which he afterwards published in his *Narrative*. The situation of librarian to the government library at Cape Town had been already awarded him, and though the salary was only £75 per annum, this small modicum was regarded as the foretaste of better things to come. All promised this, indeed, in a colony which had lately passed into our hands, and where a British population and character were to be superinduced,

as speedily as possible, upon the original Dutch colonization. Slavery was to be extinguished, churches and schools to be erected, the English language to be established, and all things changed for the better. This was the commencement of a colonial millennium, into which Pringle threw himself with ardour. Eager to be at the head of the literary and educational departments of this happy change, he received pupils for private instruction; wrote to his talented friend Mr. Fairbairn, in Scotland, to come out to his aid, for the land lay before them to enter and possess it; and planned, in conjunction with the Rev. Mr. Faure, a Dutch minister in Cape Town, the publication of a new periodical for the wider dissemination of knowledge, that should be written both in Dutch and English. This last project would have been admirable in London or Edinburgh; but in a colony where discontent was so rife—above all, in a conquered colony, where the two European races were still at daggers-drawing—what individual man, however good or talented, could be intrusted with the unlimited power of publishing what he pleased? Besides, was there not already the *Government Gazette*, which contained everything in the shape of political intelligence, at least, that the colonists needed to know? It was no wonder that Pringle's application for permission to start his journal was refused. He received a verbal answer from the governor, through his secretary, intimating that "the application had not been seen in a favourable light." Nothing of course remained for him but submission; but as the arrival of British commissioners was expected, who were to examine into the state of the colony, he hoped they would sanction his proposal. The commissioners arrived, and thought well of it; but all that they could do was to report of it to the home government. Thus thrown back for an indefinite period, if not for ever, he resumed his educational labours with greater zeal than before; and Mr. Fairbairn having arrived from Scotland, the two were soon at the head of a large flourishing boarding establishment of pupils at Cape Town. And now it was that a whole sunny shower of good fortune had commenced, and was to fall upon him as it had done in Edinburgh; for while he was thus prospering, the home government had received his proposals of a new journal, and sent out full permission for its commencement. Thus the *South African Journal* started into life upon the original plan, one edition being in Dutch and the other in English. Soon after, Mr. Greig, a printer, encouraged by this beginning, commenced the *South African Commercial Advertiser*, a weekly newspaper, of which Pringle also undertook the editorship. He was again a twofold editor, as well as government librarian, and at the head of an educational establishment which was daily becoming more prosperous. But how long was this good fortune to last?—scarcely even so long as it had done in Edinburgh, while the downfall that followed was to be more sudden and complete.

The commencement of the evil was of a kind always dangerous to free, high-spirited, colonial journalism—it was a government trial. A person named Edwards had libelled the governor, and was tried for the offence, while a report of the proceedings was expected in Pringle's newspaper. This expectation was fulfilled; but as it was a ticklish duty, the editor had done his best to expunge from it whatever he thought might be offensive to the ruling powers. Still the feeling on the other side was that he had not expunged enough, and a stringent remedy was forthwith applied to prevent all such shortcomings in future. The fiscal was ordered to proceed to the

printing-office and assume the censorship of the press. This interference, however, deemed necessary on the one side, was not to be tolerated on the other; and Pringle and his colleague, who had no other remedy, abandoned their editorships of the *South African Commercial Advertiser*, while Greig, its printer, for announcing his purpose to appeal to the home government, was ordered to leave the colony within a month. The *South African Journal* was the next point of attack on the part of the zealous fiscal, as in the second number, which had just been published, certain obnoxious paragraphs had appeared; and although Pringle declared that had he seen them in time he would have expunged them, or suppressed the number, the plea of inadvertence, so available to journalists at home, was not judged sufficient in South Africa. The dragon's teeth of Cadmus, which, if sown at the foot of Hymettus, would not have produced a dragonet, or even a lizard, were enough, in the mischievous soil of Bœotia, to bring forth a whole harvest of pugnacious homicides. The fiscal performed his duty to his employer, and Pringle his to literature and the liberty of the press, so that the magazine was discontinued, and the fact announced in the *Gazette*. And now entered a third and more formidable element of discord to deepen the confusion. The public at large were determined not to be bereaved of their periodical, and a petition to that effect, and numerously signed, was presented to the colonial council. In this trying dilemma the governor, Lord Charles Somerset, had recourse to what he would no doubt have called negotiation, but which Pringle termed "bullying;" and sending for the latter, subjected him to a very stormy course of questioning, which he answered with equal spirit, and perhaps with almost equal asperity. The result was, that Pringle sent in his resignation of librarian, and thus shook himself loose of every government tie. But this was no expiation; on the contrary, it was regarded as a defiance of government, and as such it was treated. Every mode of disparagement was therefore brought against him by the government officials and their adherents, which soon told upon the prosperity of his seminary; for who could venture to send his children thither, when its proprietor was under the ban of the colonial aristocracy? The school was soon closed; and thus bereft of every resource, Pringle, with his wife and sister-in-law, left the colony, and arrived in London on the 7th of July, 1826. He had still two sources of consolation in his affliction, of which his enemies could not deprive him. He had given such a literary and educational impulse to the colony, that the good work was certain to go on and prosper, even though it was deprived of his presence. And as for the community which he had been the means of planting at Glen-Lynden, their numbers at his departure had been doubled, while their industry had so effectually enriched the wilderness, that every year promised to bring them additional comfort and abundance.

On returning home Pringle applied at headquarters for a compensation of his losses, which he estimated at £1000; but the claim was disallowed, as his statement of wrongs sustained from the colonial government was contradicted by the chief-justice

of the Cape. To add to his difficulties, that sum which was refused him he must now refund, for he was £1000 in debt, in consequence of the abrupt manner in which his prospects in the colony had been crushed. He must once more place his sole reliance in his pen—a fatal necessity which he had always deprecated. He edited an annual entitled *Friendship's Offering*, and seemed to be irrecoverably doomed to such humble and precarious authorship, when, fortunately, an article which he had written upon the subject of slavery in South Africa before he left the colony, and transmitted to the *New Monthly Magazine*, arrested the attention of Messrs. Z. Macaulay and Buxton, by whose influence he was appointed secretary to the Anti-slavery Society. No situation could have been more accordant with his predilections. He had hitherto been the advocate of the enslaved Hottentot and injured Caffre, while the recollection of his own wrongs gave a double edge to his remonstrances, and fresh fire to his eloquence; but now there was full scope for his pen upon the subject, and that, too, not in behalf of one or two tribes, but of humanity at large. He not only threw himself heartily into the work, but inspired others with congenial enthusiasm; while the directors of the society could not sufficiently admire the greatness of his zeal and value of his services. At length, as all the world well knows, the persevering labours of the slavery abolitionists were crowned with success, and on the 27th of June, 1834, the document of the society announcing the act of abolition, and inviting all interested in the cause to set apart the approaching 1st of August as a day of religious gratitude and thanksgiving, was signed "Thomas Pringle." In this way he had unconsciously been removed from Africa, the interests of whose oppressed children he had so deeply at heart, to a situation where he could the most effectually promote the great work to which his philanthropic energies were devoted. What, compared with this, would his solitary appeals have been in behalf of Hottentots, Bosjesmen, and Bechuanas?

And now his appointed work was done. He had lived, and toiled, and succeeded—and what further can man expect upon earth? Only the day after the document was given forth that proclaimed the triumph of Africa and humanity, Pringle was attacked by his last illness, and from the most trivial of causes—a crumb of bread that had passed down the wind-pipe, and occasioned a severe fit of coughing, by which some small blood-vessel was lacerated. Consumption followed; but, unaware of the fact, his chief wish was to return to the Cape, and settle, with a few hundred pounds, upon a farm on the frontier of Caffraria. As a voyage was judged necessary for the recovery of his health, he resolved to combine this with his wish to become a settler, and had engaged a passage to the Cape, with his wife and sister-in-law; but his disease assumed such an aspect that he was unable to embark. The result may be easily guessed: he sunk under the cureless malady, and expired Dec. 5, 1834, in his forty-sixth year. His remains were interred in Bunhill Fields, and a stone, with an elegant inscription by William Kennedy, marks the place where they lie.

R.

RAEBURN, SIR HENRY, a celebrated portrait-painter, was the younger son of Mr. William Raeburn, a respectable manufacturer at Stockbridge, near Edinburgh, where he was born, 4th March, 1756. While very young he had the misfortune to lose both his parents; but this want was supplied to him as much as it could be by his elder brother William, who succeeded to the business, and acted always to him the part of a father. It has been represented by some of Sir Henry's biographers (perhaps with a view of making the after acquirements of the subject of the biography more remarkable), that he received his education at Heriot's Hospital, a well-known and benevolent institution in Edinburgh; but this is not the fact, his brother William having with heartfelt satisfaction given him the scanty but usual education of that period. In the usual routine of education he was not remarked to display any superiority to his class-fellows, except when they were drawing figures on their slates or copy-books, in which case those of Raeburn surpassed all the rest; but this did not lead any further. In other respects he was distinguished by the affection of his companions, and formed at that early period intimacies with some of those distinguished friends whose regard accompanied him through life. The circumstances of young Raeburn rendering it necessary that he should, as early as possible, be enabled to provide for his own support, he was at the age of fifteen apprenticed to a goldsmith, who kept his shop in a dark alley leading between the Parliament Square and the front of the Old Tolbooth. Here, without receiving any lessons, he began to amuse himself by sketching figures, and ultimately by painting miniatures.¹ His master, at first incensed at his apparent inattention to business, was afterwards astonished by the merit of his performances, and, with a liberality hardly to have been expected, conducted him to a place where he might gather the means of improvement in his self-assumed art, namely, the studio of Mr. David Martin, the principal portrait-painter in Edinburgh. He was delighted with the works there presented to his eye; and Martin, on the other hand, spoke encouragingly to the young artist. His miniatures soon became so famous that

commissions came rapidly in, and he generally painted two in the week. As this employment, of course, withdrew his time almost entirely from trade, he made an arrangement with his master, by which the latter was compensated for the loss he incurred on that account. While still an apprentice he began to paint in oil, and on a large scale. To aid him in this task he obtained from Martin the loan of several pictures to copy; but that painter did not contribute advice or assistance in any other shape; and having once unjustly accused the young student of selling one of the copies, Raeburn indignantly refused any farther accommodation of this nature. Having begun, however, to paint large oil pictures, he soon adopted them in preference to miniatures, a style which he gradually gave up; nor did his manner in later life retain any trace of that mode of painting; all was broad, massy, and vigorous.

He had thus become a painter almost by intuition; for there is no ascertaining that he ever received any direct instructions in the mysteries, or even in the manual operations, of his art. It was in his twenty-second year, and when practising regularly as a rival of his old friend Martin, that he became acquainted, under extraordinary circumstances, with the lady who became his wife. "One day," says his most animated biographer,² "a young lady presented herself at his studio, and desired to sit for her portrait. He instantly remembered having seen her in some of his excursions, when, with his sketch-book in his hand, he was noting down some fine snatches of scenery; and as the appearance of anything living and lovely gives an additional charm to a landscape, the painter, like Gainsborough in similar circumstances, had readily admitted her into his drawing. This circumstance, he said, had had its influence. On further acquaintance he found that, besides personal charms, she had sensibility and wit. His respect for her did not affect his skill of hand, but rather inspired it, and he succeeded in making a fine portrait. The lady, Ann Edgar, the daughter of Peter Edgar, Esq., of Bridglands, was much pleased with the skill and likewise with the manners of the artist; and about a month or so after the adventure of the studio, she gave him her hand in marriage, bestowing at once an affectionate wife and a handsome fortune."

Having now the means of improving in his art, he set out for London, and was introduced to Sir Joshua Reynolds, who treated him with distinguished liberality and kindness, even to the extent of offering him money to prosecute his studies in Rome, which he was not aware that Raeburn did not need. Furnished with introductions by this eminent person, he set out for the capital of the arts, accompanied by his wife. At Rome he was considerably indebted for advice to Mr. Gavin Hamilton, and likewise to Mr. Byers, who gave him the excellent counsel never to copy any object from memory; but, from the principal figure to the minutest accessory, to have it placed before him. To the observance of this rule Raeburn imputed in a great measure the improvement which was observed in his subsequent pictures.

His powers now fully matured, he returned in 1787 to his native city, and set up his easel in a fashionable house in George Street. The works of Martin

¹ "It was in this situation," says Dr. A. Duncan, senr., "that my first acquaintance with him commenced, and that, too, on a melancholy occasion. Mr. Charles Darwin, son of the justly celebrated Dr. Erasmus Darwin, author of that much esteemed poem the *Botanic Garden*, and of other works demonstrating great genius, died during the course of his medical studies at Edinburgh. At that time I had the honour, though a very young medical lecturer, of ranking Darwin among the number of my pupils. And I need hardly add, that he was a favourite pupil: for, during his studies, he exhibited such uncommon proofs of genius and industry as could not fail to gain the esteem and affection of every discerning teacher.

"On the death of young Darwin I was anxious to retain some slight token in remembrance of my highly esteemed young friend; and, for that purpose, I obtained a small portion of his hair. I applied to Mr. Gilliland, at that time an eminent jeweller in Edinburgh, to have it preserved in a mourning ring. He told me that one of his present apprentices was a young man of great genius, and could prepare for me in hair a memorial that would demonstrate both taste and art. Young Raeburn was immediately called, and proposed to execute, on a small trinket which might be hung at a watch, a muse weeping over an urn, marked with the initials of Charles Darwin. This trinket was finished by Raeburn in a manner which, to me, afforded manifest proof of very superior genius, and I still preserve it, as a memorial of the singular and early merit both of Darwin and of Raeburn."

² Mr. Allan Cunningham, in his *Lives of British Painters*.

—though certainly better than the biographers of Raeburn delight to represent them—were so much eclipsed by the junior artist, that the whole tide of employment left the one painter for the other. In vain did the veteran prophesy that this fever of approbation could not last, and that “*the lad in George Street*” painted better before he went to Rome. The nation persisted in being of another opinion, and Martin was at last obliged to retire from the field in despair. Raeburn at once assumed that pre-eminent rank in his profession, which, notwithstanding the multitude of rivals who afterwards rose around him, he bore to the day of his death.

The subsequent history of this artist is chiefly that of his pictures. For thirty-six years he was constantly employed in his professional duties, and painted the most of the eminent persons who lived in Scotland during that time. Unfortunately no record has been preserved of his various works; but they are to be found in almost every distinguished mansion in the country.¹ Having stored his mind with ideas drawn from the purest school of modern art, he was indebted for his subsequent improvement solely to his own reflections and the study of nature. He was never in the habit of repairing to London; and, indeed, he did not visit that metropolis above three times, nor did he reside in it altogether more than four months. He was thus neither in the habit of seeing the works of his contemporaries, nor the English collections of old pictures. Whatever disadvantage might attend this, it never stopped the career of his improvement. Probably, indeed, it had the effect of preserving that originality which formed always the decided character of his productions, and kept him free from being trammelled by the style of any class of artists. Perhaps, also, the elevation and dignity of style which he always maintained might be greatly owing to his exclusive acquaintance with the works of the Italian masters. In English collections the Dutch specimens are necessarily so prominent, both as to number and choice, that a familiar acquaintance with them must be apt to beget a taste for that homely truth and minute finishing in which their merit consists.

The first excellence of a portrait, and for the ab-

sence of which nothing can atone, must evidently be its resemblance. In this respect Sir Henry's eminence was universally acknowledged. In the hands of the best artists there must, in this part of their task, be something precarious; but in a vast majority of instances his resemblances were most striking. They were also happily distinguished by being always the most favourable that could be taken of the individual, and were usually expressive as well of the character as of the features. This desirable object was effected not by the introduction of any ideal touches, or any departure from the strictest truth, but by selecting and drawing out those aspects under which the features appeared most dignified and pleasing. He made it his peculiar study to bring out the mind of his subjects. His penetration quickly empowered him to discover their favourite pursuits and topics of conversation. Sir Henry's varied knowledge and agreeable manners then easily enabled him in the course of the sitting to lead them into an animated discussion on those ascertained subjects. As they spoke he caught their features, enlivened by the strongest expression of which they were susceptible. While he thus made the portrait much more correct and animated, his sitters had a much more agreeable task than those who were pinned up for hours in a constrained and inanimate posture, and in a state of mental vacuity. So agreeable, indeed, did many of the most distinguished and intelligent among them find his society, that they courted it ever after, and studiously converted the artist into a friend and acquaintance.

Besides his excellence in this essential quality of portrait, Sir Henry possessed also in an eminent degree those secondary merits which are requisite to constitute a fine painting. His drawing was correct, his colouring rich and deep, and his lights well disposed. There was something bold, free, and open in the whole style of his execution. The accessories, whether of drapery, furniture, or landscapes, were treated with elegance and spirit; yet without that elaborate and brilliant finishing, which makes them become principals. These parts were always kept in due subordination to the human figure; while of it, the head came always out as the prominent part. Animals, particularly that noble species the horse, were introduced with peculiar felicity; and Sir Henry's equestrian portraits are perhaps his very best performances. The able manner in which the animal itself was drawn, and in which it was combined with the human figure, were equally conspicuous.

In private life Raeburn was remarkable for his courteous and amiable manners and his great domestic worth. While his painting-rooms were in George Street, and latterly in York Place, he resided in a sequestered villa called St. Bernard's, near the village where he drew his first breath, then distant from, but now engrossed in, the extending city—where he amused his leisure hours by the society of his children and grandchildren, the cultivation of his garden, and the study of ship-building, and some other mechanical pursuits, for which he had a liking. The hours between nine and four he almost invariably spent in his studio. He latterly found another kind of employment for his leisure in planning out the environs of his little villa, which consisted of about ten acres, in lots for building, and in designing the architectural elevations of a little group of streets with which the ground was to be occupied. It may readily be supposed that in this task he manifested a superiority of taste, corresponding in some measure with his supremacy in another branch of art. The suburb which has arisen upon his property, and which

¹ The following pictures by Sir Henry Raeburn, besides others, have been engraved:—[*Full length.*] First Viscount Melville, in peer's robes. General Sir David Baird, with horse. Sir Walter Scott, Bart. Macdonnell of Glangary. Lord Chief-commissioner Adam. Henry Mackenzie. General the Earl of Hopetoun, with horse.—[*Three-quarters Length.*] Captain G. Duff, of the *Mars*, who fell at Trafalgar. Neil Gow, with his fiddle. Dr. Alexander Adam. James Pillans, professor of humanity, Edinburgh. John Clerk, of Eldin. Charles Hope, president of the Court of Session. Robert Macqueen of Braxfield, in judiciary robes. Hon. Henry Erskine. Dugald Stewart, professor of moral philosophy. James Gregory, M.D. Robert Blair, president of the Court of Session. George IV. Robert Dundas, president of the Court of Session. John Elder, provost of Edinburgh, in his robes. William Creech, bookseller. Professor Thomas Hope. Dr. Hugh Blair. James Balfour, Esq., golfer.—[*Half Length.*] Rev. Dr. Andrew Hunter, professor of divinity. George Jardine, professor of logic, Glasgow. Justice-clerk Macqueen. Lord Chief-baron Dundas. Hay, Lord Newton. Rev. Dr. David Johnston, minister of North Leith. Rev. Dr. John Erskine. Dr. James Hamilton. John Gray, Esq., golfer. Professor Playfair. Sir Walter Scott, when young; Dutton, when older. Sir John Sinclair, of Ulbster, Bart. Tytler of Woodhouselee. Harry David Inglis, advocate. Sir Henry Raeburn. Dr. George Hill, principal of St. Andrews. Rev. Archibald Alison. Mr. Francis Jeffrey. Henry Cockburn. Lord Meadowbank.—The following are portraits which, with many others, have not been engraved:—Sir Henry Stewart of Allanton. Mr. Benjamin Bell, surgeon. Mr. Leonard Horner. Mr. Henry Raeburn, the painter's son. The Duke of Hamilton. Lord Frederick Campbell. The Laird of Macnab, in Highland costume. Earl of Breadalbane. Sir John Douglas. Marquis of Huntly. Sir John Hay. Archibald Constable. Rev. F. Thomson. Sir John and Lady Clerk. Mr. Rennie, engineer. Dr. Lindsay, Pinkieburn. Dr. Alexander Duncan.

was only commenced in his own lifetime, is accordingly conspicuous for the elegance displayed both in its general arrangement and in its details, and has become a favourite residence with such individuals as do not find it necessary, for professional reasons, to live nearer the centre of the city.

In 1814 Raeburn was made an associate of the Royal Academy, and in the subsequent year he became an academician. He afterwards obtained from foreign countries many honours of the same kind. In 1822, when George IV. visited Scotland, the long-established fame of Raeburn, together with his fortune and gentlemanly manners, pointed him out as an individual in whom the king might signify his respect for Scottish art, and he was accordingly knighted at Hopetoun House, on the last day of his majesty's residence in the country. Some weeks afterwards his brethren in art, now increased to a large and respectable body, gave him a dinner as a token of their admiration of his talents and character. In his speech on this occasion he said modestly that he was glad of their approbation, and had tried to merit it; for he had never indulged in a mean or selfish spirit towards any brother-artists, nor had at any time withheld the praise which was due to them, when their works happened to be mentioned.

Sir Henry received afterwards the appointment of portrait-painter to his majesty for Scotland; a nomination, however, which was not announced to him till the very day when he was seized with his last illness. The king, when conferring the dignity of knighthood, had expressed a wish to have a portrait of himself painted by this great artist; but Sir Henry's numerous engagements prevented him from visiting the metropolis for that purpose. It reflects great honour on the subject of this memoir, that he never gave way to those secure and indolent habits which advanced age and established reputation are so apt to engender. He continued, with all the enthusiasm of a student, to seek and to attain further improvement. The pictures of his two or three last years are unquestionably the best that he ever painted. But perhaps the most interesting part of his recent works consists in a series of half-length portraits of eminent Scotsmen, which during this period he executed for his private gratification.

This amiable and excellent man was suddenly affected with a general decay and debility, not accompanied by any visible complaint. This state of illness, after continuing for about a week to baffle all the efforts of medical skill, terminated fatally on the 8th July, 1823, when he had reached the age of sixty-seven.

Few men were better calculated to command respect in society than Sir Henry Raeburn. His varied knowledge, his gentlemanly and agreeable manners, an extensive command of anecdote, always well told and happily introduced, the general correctness and propriety of his whole deportment, made him be highly valued by many of the most distinguished individuals in Edinburgh, both as a companion and as a friend. His conversation might be said in some degree to resemble his style of painting—there was the same ease and simplicity, the same total absence of affectation of every kind, and the same manly turn of sense and genius. But we are not aware that the humorous gaiety and sense of the ludicrous, which often enlivened his conversation, ever guided his pencil.

Sir Henry Raeburn, like Raphael, Michael Angelo, and some other masters of the art, possessed the advantages of a tall and commanding person, and a noble and expressive countenance. He excelled in archery, golf, and other Scottish exercises;

and it may be added that, while engaged in painting, his step and attitudes were at once stately and graceful.

By his lady, who survived him ten years, Sir Henry had two sons: Peter, a youth of great promise, who died at nineteen; and Henry, who, with his wife and family, lived under the same roof with his father during the whole of their joint lives, and was his most familiar friend and companion. To the children of this gentleman the illustrious painter left the bulk of his fortune, chiefly consisting of houses and ground-rents in the suburb of St. Bernard's.

RAMSAY, ALLAN, the celebrated poet, was born at the village of Leadhills, in Lanarkshire, October 15, 1686. His parentage was highly respectable, and his ancestry even dignified. His father, Robert Ramsay, was manager of the lead-mines in Crawfordmuir, belonging to the Earl of Hopetoun; and his mother, Alice Bower, was the daughter of a gentleman who had been brought from Derbyshire to introduce and oversee some improvements in the management of the mines. His grandfather, Robert Ramsay, writer or notary in Edinburgh, was the son of Captain John Ramsay, a son of Ramsay of Cockpen, whose family was a branch of the Ramsays of Dalhousie, afterwards ennobled.¹ A grandmother of the poet, moreover, was Janet Douglas, daughter of Douglas of Muthil. Though thus well descended, he was reared in the midst of poverty. He had the misfortune to lose his father while he was yet an infant; and his mother seems almost immediately to have married a Mr. Crighton, a small landholder in the neighbourhood. Whether this last circumstance was an additional misfortune, as has been generally assumed by his biographers, we think may reasonably be questioned. It is not at all probable that his father, dying at the age of twenty-five, could have much property; and the use and wont of even a small landholder's house is not likely to have been beneath that of a poor widow's. His mother had a number of children to Mr. Crighton; but the subject of this memoir seems to have been cared for in the same way as those were, and to have enjoyed all the advantages appropriate to the same station in life. He had the benefit of the parish school till he was in his fifteenth year—an extent of education not yet common in Scotland, except when attendance on the university is included. Of the progress he had made in his studies we have unfortunately no particular account; it certainly made him acquainted with Horace, as is abundantly evident in his poems.

In the year 1700 Ramsay lost his mother; and in the following year his step-father carried him into Edinburgh, and apprenticed him to a periwig-maker, which appears to have been at that time a flourishing profession. Ramsay himself, it is said, wished to have been a painter; and his step-father has been reflected on as acting with niggardly sharp-sightedness in refusing to comply with his wishes. There is not, however, in the numerous writings of Ramsay, one single hint that any violence was, on this occasion, done to his feelings; and we think the reflection might well have been spared. Those who have borne the burden of rearing a family upon limited means know the impossibility of indulging either their own wishes or those of their children in

¹ The laird of Cockpen here mentioned is usually represented as a brother of Ramsay of Dalhousie; but the branch seems to have left the main stock at a much earlier period than that would imply. The first Ramsay of Cockpen was a son of Sir Alexander Ramsay, who was knighted at the coronation of James I. in 1424.

this respect, being often obliged to rest satisfied, not with what they would have wished, but with what they have been able to attain. There can be no doubt that Allan Ramsay served out his apprenticeship honourably, and afterwards for a number of years practised his trade as a master successfully; circumstances that, in our opinion, justify the discretion and good sense of his step-father more powerfully than any reasoning could do. It is to be regretted that of this period of his life no accounts have been handed down to us; and the more so, that we have no doubt they would show his general good sense, and the steady character of his genius, more powerfully than even the later and more flourishing periods of his history. Unlike the greater number of men of poetical talent, Ramsay had the most perfect command over himself; and the blind gropings of the Cyclops of ambition within led him to no premature attempts to attain distinction. Though he must have entertained day-dreams of immortality, he enjoyed them with moderation; and, without indulging either despondency or dejection, he waited with patience for their realization. Prosecuting his business with diligence, he possessed independence; and while in the company of respectable fellow-citizens he indulged and improved his social qualities, he, by taking to wife an excellent woman, Christian Ross, the daughter of a writer in Edinburgh, laid the foundation of a lifetime of domestic felicity.

It was in the year 1712, and in the twenty-sixth year of his age, that he entered into the state of matrimony; and the earliest of his productions that can now be traced is an epistle to the most happy members of the Easy Club, dated the same year. This club originated, as he himself, who was one of its members, informs us, "in the antipathy we all seemed to have at the ill humour and contradiction which arise from trifles, especially those that constitute Whig and Tory, *without having the grand reason for it.*" This club was in fact formed of Jacobites, and the restoration of the Pretender was the "grand reason" here alluded to. In the club every member assumed a fictitious name, generally that of some celebrated writer. Ramsay, probably from the *Tutler*, which must have been a book much to his taste, pitched upon that of Isaac Bickerstaff, but afterwards exchanged it for that of Gawin Douglas. In the presence of this club Ramsay was in the habit of reading his first productions, which, it would appear, were published by or under the patronage of the fraternity, probably in notices of its sittings, which would tend to give it celebrity and add to its influence. The *Elegy on Maggy Johnston* seems to have been one of the earliest of his productions, and is highly characteristic of his genius. An *Elegy on the Death of Dr. Pitcairne*, in 1715, was likewise read before, and published by, the club; but being at once political and personal, it was rejected by the author when he republished his poems. Allan had this year been elected poet-laureate of the club. But the rising of Mar put an end to its meetings; and Ramsay, though still a keen Jacobite, felt it to be for his interest to be so in secret. It was now, however, that he commenced in earnest his poetical career, and speedily rose to a degree of popularity which had been attained by no poet in Scotland since the days of Sir David Lindsay. For more than a century, indeed, Scottish poetry had been under an eclipse, while such poetical genius as the age afforded chose Latin as the medium of communication. Semple, however, and Hamilton of Gilbertfield, had of late years revived the notes of the Doric reed; and it seems to have been some of

their compositions, as published in Watson's *Collection* in 1706, that first inspired Ramsay. *Maggy Johnston's Elegy* was speedily followed by that on John Cowper, quite in the same strain of broad humour. The publication of King James' *Christ's Kirk on the Green*, from an old manuscript, speedily followed, with an additional canto by the editor, which, possessing the same broad humour, in a dialect perfectly level to the comprehension of the vulgar, while its precursor could not be read even by them without the aid of explanatory notes, met with a most cordial reception. Commentators have since that period puzzled themselves not a little to explain the language of the supposed royal bard. Ramsay, however, saved himself the trouble, leaving every one to find it out the best way he might, for he gave no explanations; and at the same time, to impress his readers with admiration of his great learning, he printed his motto, taken from Gawin Douglas, in Greek characters. A second edition of this work was published in the year 1718, with the addition of a third canto, which increased its popularity so much that, in the course of the four following years, it ran through five editions. It was previously to the publication of this work in its extended form that Allan Ramsay had commenced the book-selling business, for it was "printed for the author, at the *Mercury*, opposite to Niddry's Wynd;" but the exact time when, or the manner how, he changed his profession has not been recorded. At the *Mercury*, opposite to the head of Niddry's Wynd, Ramsay seems to have prosecuted his business as an original author, editor, and bookseller with great diligence for a considerable number of years. His own poems he continued to print as they were written, in single sheets or half sheets, in which shape they are reported to have found a ready sale, the citizens being in the habit of sending their children with a penny for "Allan Ramsay's last piece." In this form were first published, besides those we have already mentioned, the *City of Edinburgh's Address to the Country*, the *City of Edinburgh's Salutation to the Marquis of Caernarvon*, *Elegy on Lucky Wood*, *Familiar Epistles*, &c. &c., which had been so well received by the public that in the year 1720 he issued proposals for republishing them, with additional poems, in one volume quarto. The estimation in which the poet was now held was clearly demonstrated by the rapid filling up of a list of subscribers, containing the names of all who were eminent for talents, learning, or dignity in Scotland. The volume, handsomely printed by Ruddiman, and ornamented by a portrait of the author, from the pencil of his friend Smibert, was published in the succeeding year, and the fortunate poet realized 400 guineas by the speculation. This volume was, according to the fashion of the times, prefaced with several copies of commendatory verses; and it contained the first scene of the *Gentle Shepherd*, under the title of "Patie and Roger," and apparently intended as a mere pastoral dialogue. Incited by his brilliant success, Ramsay redoubled his diligence, and in the year 1722 produced a volume of *Fables and Tales*; in 1723 the *Fair Assembly*; and in 1724, *Health*, a poem inscribed to the Earl of Stair. In the year 1719 he had published a volume of *Scottish Songs*, which had already run through two editions, by which he was encouraged to publish, in January, 1724, the first volume of the *Tea-table Miscellany*, a collection of songs, Scottish and English. This was soon followed by a second; in 1727 by a third; and some years afterwards by a fourth. The demand for this work was so great that, in the course of a few years, it ran through twelve editions. In later times Ram-

say has been condemned for what he seems to have looked upon as a meritorious piece of labour. He had refitted about sixty of the old airs with new verses, partly by himself and partly by others; which was perhaps absolutely necessary on account of the rudeness and indecency of the elder ditties. Modern antiquaries, however, finding that he has thus been the means of banishing the latter order of songs out of existence, declaim against him for a result which he perhaps never contemplated, and which, to say the least of it, could never have occurred if the lost poems had possessed the least merit. That Ramsay, in publishing a work for the immediate use of his contemporaries, did not consult the taste or wishes of an age a century later, was certainly very natural; and though we may regret that the songs are lost, we cannot well see how the blame lies with him. Ramsay, let us also recollect, was at this very time evincing his desire to bring forward the really valuable productions of the elder muse. In the year 1724 he published the "*Ever-Green*, being a Collection of Scots Poems, wrote by the Ingenious before 1600." Ramsay, however, was neither a faithful nor a well-informed editor. He introduced into this collection as ancient compositions two pieces of his own, entitled the *Vision* and the *Eagle and Robin Redbreast*, the former being a political allegory with a reference to the Pretender.

Ramsay had already written and published, in his first volume of original poetry, *Patie and Roger*, which he had followed up the following year with *Jenny and Maggy*, a pastoral, being a sequel to *Patie and Roger*. These sketches were so happily executed, as to excite in every reader a desire to see them extended. He therefore proceeded with additional colloquies in connection with the former, so as to form in the end a dramatic pastoral in five acts. In the following letter, published here for the first time, it will be seen that he was engaged on this task in spring 1724, at a time when the duties of life were confining him to the centre of a busy city, and when, by his own confession, he had almost forgot the appearance of those natural scenes which he has nevertheless so admirably described:—

ALLAN RAMSAY TO WILLIAM RAMSAY OF TEMPLE-HALL, ESQ.

"EDINBURGH, April 8th, 1724.

"Sir,—These come to bear you my very heartyest and grateful wishes. May you long enjoy your Marlefield, see many a returning spring pregnant with new beautys; may everything that's excellent in its kind continue to fill your extended soul with pleasure. Rejoyce in the beneficence of heaven, and let all about ye rejoyce—whilst we, alake, the laborious insects of a smoaky city, hurry about from place to place in one eternal maze of fatiguing cares, to secure this day our daylie bread—and something till't. For me, I have almost forgot how springs gush from the earth. Once I had a notion how fragrant the fields were after a soft shower; and often, time out of mind! the glowing blushes of the morning have fired my breast with raptures. Then it was that the mixture of rural music echo'd agreeable from the surrounding hills, and all nature appear'd in gayety.

"However, what is wanting to me of rural sweets I endeavour to make up by being continually at the acting of some new farce, for I'm grown, I know not how, so very wise, or at least think so (which is much about one), that the mob of mankind afford me a continual diversion; and this place, tho' little, is crowded with merry-andrews, fools, and fops of

all sizes, [who] intermix'd with a few that can think, compose the comical medley of actors.

"Receive a sang made on the marriage of my young chief. I am, this vacation, going through with a dramatick pastoral, which I design to carry the length of five acts, in verse a' the gate, and if I succeed according to my plan, I hope to tope with the authors of *Pastor Fido* and *Aminta*.

"God take care of you and yours is the constant prayer of, sir, your faithful humble servant,

"ALLAN RAMSAY."

The poem was published in 1725 under the title of the *Gentle Shepherd*, and met with instant and triumphant success. A second edition was printed by Ruddiman for the author, who still resided at his shop opposite Niddry's Wynd; but the same year he removed from this his original dwelling to a house in the east end of the Luckenbooths, which had formerly been the London Coffee-house. Here, in place of Mercury, he adopted the heads of Ben Jonson and Drummond of Hawthornden, and in addition to his business as a bookseller he commenced that of a circulating library. Ramsay was the first to establish such a business in Scotland, and it appears that he did so not without some opposition from the more serious part of the community, who found fault with him for lending the loose plays of that age to persons whose morals were liable to be tainted by them. In this shop the wits of Edinburgh continued daily to meet for information and amusement during the days of Ramsay and his successors in trade. In the year 1728 he published by subscription the second volume of his poems in quarto (including the *Gentle Shepherd*), which was equally successful with the first. Of this volume a second edition was printed in octavo in the succeeding year. In 1730 Ramsay published a collection of thirty fables, after which, though he wrote several copies of verses for the amusement of his friends, he gave nothing more to the public. His fame was now at the full, and though he had continued to issue a number of volumes every year, all equally good with those that preceded them, it could have received no real addition. Over all the three kingdoms, and over all their dependencies, the works of Ramsay were widely diffused and warmly admired. The whole were republished by the London booksellers in the year 1731, and by the Dublin booksellers in 1733, all sterling proofs of extended popularity, to which the poet himself failed not on proper occasions to allude.

Ramsay had now risen to wealth and to high respectability, numbering among his familiar friends the best and the wisest men in the nation. By the greater part of the Scottish nobility he was caressed, and at the houses of some of the most distinguished of them—Hamilton Palace, Loudoun Castle, &c.—was a frequent visitor. With Duncan Forbes, lord-advocate, afterwards lord-president, and the first of Scottish patriots, Sir John Clerk, Sir William Bennet, and Sir Alexander Dick, he lived in the habit of daily and familiar and friendly intercourse. With contemporary poets his intercourse was extensive and of the most friendly kind. The two Hamiltons, of Bangour and Gilbertfield, were his most intimate friends. He addressed verses to Pope, to Gay, and to Somerville, the last of whom returned his poetical salutations in kind. Mitchell and Mallet shared also in his friendly greetings. Meston addressed to him verses highly complimentary, and William Scott of Thirlstane wrote Latin hexameters to his praise. Under so much good fortune he could not escape the malignant glances of envious and disappointed poetsasters, and of morose and stern moralists. By the

first he was annoyed with a "*Block for Allan Ramsay's Wig, or the Poet fallen in a Trance*;" by the latter, "*Allan Ramsay metamorphosed to a Heather-blower Poet*," in a Pastoral between Algon and Meliboea," with the "*Flight of Religious Piety from Scotland*," upon the Account of Ramsay's Lewd Books and the Hellbred Playhouse Comedians, who debauch all the Faculties of the Souls of the Rising Generation;" a "*Looking-glass for Allan Ramsay, the Dying Words of Allan Ramsay, &c.*" The three last of these pieces were occasioned by a speculation which he entered into for the encouragement of the drama, to which he appears to have been strongly attached. For this purpose, about the year 1736, he built a play-house in Carrubber's Close at vast expense, which, if it was ever opened, was immediately shut up by the act for licensing the stage which was passed in the year 1737. Ramsay on this occasion addressed a rhyming complaint to the Court of Session, which was first printed in the *Gentleman's Magazine*, and since in all the editions that have been given of his works. It does not, however, appear that he obtained any redress, and the pecuniary loss which he must have suffered probably affected him more than the lampoons to which we have alluded. He had previously to this published his *Reasons for not Answering the Hackney Scribblers*, which are sufficiently biting, and with which he seems to have remained satisfied through life. He has described himself in one of his epistles as a—

"Little man that lo'd his ease,
And never tho'd these passions lang,
That rudely meant to do him wrang;"

which we think the following letter to his old friend Smibert, the painter, who had by this time emigrated to the western world, will abundantly confirm:—"My dear old friend, your health and happiness are ever an addition to my satisfaction. God make your life easy and pleasant. Half a century of years have now rowed o'er my pow, that begins to be lyart; yet thanks to my author I eat, drink, and sleep as sound as I did twenty years syne, yea I laugh, heartily too, and find as many subjects to employ that faculty upon as ever; fools, fops, and knaves grow as rank as formerly, yet here and there are to be found good and worthy men who are an honour to human life. We have small hopes of seeing you again in our old world; then let us be virtuous and hope to meet in heaven. My good auld wife is still my bed-fellow. My son Allan has been pursuing your science since he was a dozen years auld; was with Mr. Hyfidg at London for some time about two years ago; has been since at home, painting here like a Raphael; sets out for the seat of the beast beyond the Alps within a month hence, to be away about two years. I'm sweer to part with him, but canna stem the current which flows from the advice of his patrons and his own inclination. I have three daughters, one of seventeen, one of sixteen, and one of twelve years old, and no ae wally dragle among them—all fine girls. These six or seven years past I have not written a line of poetry; I can give over in good time before the coolness of fancy that attends advanced years should make me risk the reputation I had acquired.

"Frae twenty-five to five-and-forty,
My muse was neither sweer nor dorthy,
My Pegasus would break his tether,
E'en at the shaking of a feather;
And through ideas scour like drift,
Streking his wings up to the lift.
Then, then my soul was in a low,
That gart my numbers safely row;
But eild and judgment 'gin to say,
Let be your sangs, and learn to pray."

It is scarcely possible to conceive a more pleasing picture of ease and satisfaction than is exhibited in the above sketch; and, the affair of the theatre in Carrubber's Close excepted, Ramsay seems to have filled it up to the last. He lost his wife, Christian Ross, in the year 1743; but his three daughters, grown up to womanhood, in some measure supplied the want of her society, and much of his time in his latter years seems to have been spent with his friends in the country. It appears to have been about this period, and with the view of relinquishing his shop, the business of which still went on prosperously, that he erected a house on the north side of the Castle Hill, where he might spend the remainder of his days in dignified retirement. The site of this house was selected with the taste of a poet and the judgment of a painter. It commanded a reach of scenery probably not surpassed in Europe, extending from the mouth of the Forth on the east to the Grampians on the west, and stretching far across the green hills of Fife to the north; embracing in the including space every variety of beauty, of elegance, and of grandeur. The design for the building, however, which the poet adopted, was paltry in the extreme, and by the wags of the city was compared to a goose-pie, of which complaining one day to Lord Elbank, his lordship gayly remarked, that now seeing him in it he thought it an exceedingly apt comparison. Fantastic though the house was, Ramsay spent the last twelve years of his life in it, except when he was abroad with his friends, in a state of philosophic ease, which few literary men are able to attain. In the year 1755 he is supposed to have relinquished business. An epistle which he wrote this year to James Clerk, Esq. of Pennycuik, "full of wise saws and modern instances," gives his determination on the subject, and a picture of himself more graphic than could be drawn by any other person:—

"Tho' born to no ae inch of ground,
I keep my conscience white and sound;
And though I ne'er was a rich keeper,
To make that up I live the cheaper;
By this ae knack I've made a shift
To drive ambitious care adrift;
And now in years and sense grown auld,
In ease I like my limbs to fauld.
Debts I abhor, and plan to be
From shackling trade and dangers free;
That I may, loosed frae care and strife,
With calmness view the edge of life;
And when a full ripe age shall crave
Slide easily into my grave;
Now seventy years are o'er my head,
And thirty more may lay me dead."

While he was thus planning schemes of ease and security, Ramsay seems to have forgotten the bitter irony of a line in one of his elegies,—

"The wily carl, he gathered gear,
But ah! he's dead."

At the very time he was thus writing, he was deeply afflicted with the scurvy in his gums, by which he eventually lost all his teeth, and even a portion of one of his jawbones. He died at Edinburgh on the 7th of January, 1757, in the seventy-third year of his age. He was buried on the 9th of the month without any particular honours, and with him for a time was buried Scottish poetry, there not being so much as one poet found in Scotland to sing a requiem over his grave. His wife, Christian Ross, seems to have brought him seven children, three sons and four daughters; of these Allan, the eldest, and two daughters survived him. Of the character of Ramsay the outlines we presume may be drawn from the comprehensive sketch which we have exhibited of the events of his life. Prudent self-control seems to have been his leading characteristic, and the acquisition of a competency the great object of his life. He

was one of the few poets to whom, in a pecuniary point of view, poetry has been really a blessing, and who could combine poetic pursuits with those of ordinary business.

RAMSAY, ALLAN, an eminent portrait-painter, was the eldest son of the subject of the preceding article, and was born in Edinburgh in the year 1713. He received a liberal education, and displayed in boyhood a taste for the art which he afterwards successfully cultivated. It is to be supposed that the father would be the less inclined to control his son in this matter, as he was himself in early life anxious to be brought up as a painter. In Italy young Ramsay studied three years under Solimano and Imperiali, two artists of celebrity. He then returned to his native country, and commenced business, painting, amongst others, his father's friend President Forbes, and his own sister Janet Ramsay, whose portraits are preserved in Newhall House; and an excellent full-length of Archibald Duke of Argyle, in his robes as an extraordinary lord of session, now in the town-hall, Glasgow. The name of Allan Ramsay, junr., is found in the list of the members of the Academy of St. Luke, an association of painters and lovers of painting instituted at Edinburgh in 1729, but which does not appear to have done anything worthy of record.¹ It would also appear that he employed part of his time in giving private instructions in drawing, for it was while thus engaged in the family of Sir Alexander Lindsay of Evelick that he gained the heart and hand of the baronet's eldest daughter, Margaret—a niece of the illustrious Mansfield—by whom he had three children. In 1754 he became the founder of the Select Society, which comprised all the eminent learned characters then living in the Scottish capital, and which he was well qualified to adorn, as he was an excellent classical scholar, knew French and Italian perfectly, and had all the polish and liberal feeling of a highly instructed man.

Previously to this period he had made London his habitual residence, though he occasionally visited both Rome and Edinburgh. In Bouquet's pamphlet on the *Present State of the Fine Arts in England*, published in 1753, he is spoken of as "an able painter, who, acknowledging no other guide than nature, brought a rational taste of resemblance with him from Italy. Even in his portraits," says this writer, "he shows that just steady spirit which he so agreeably displays in his conversation." He found in the Earl of Bridgewater one of his earliest English patrons. He was also introduced by the Earl of Bute to the Prince of Wales, afterwards George III., of whom he painted portraits, both in full length and in profile, which were engraved, the one by Ryland, the other by Woollett. He practised portrait-painting for several years with distinguished success, being deficient, according to Walpole, rather in subjects than in genius. His portraits are distinguished by a calm unaffected representation of nature; and he is universally allowed to have contributed with Reynolds to raise this branch of art in Britain. He had not long been in practice before he acquired considerable wealth, which, it appears, he used in a liberal spirit. When his father died in 1757, in somewhat embarrassed circumstances, he paid his debts, settling at the same time a pension on his unmarried sister Janet Ramsay, who survived till 1804.

¹ The rules of this obscure institution, with the signatures, were published by Mr. Patrick Gibson, in his "View of the Arts of Design in Britain," in the *Edinburgh Annual Register* for 1816.

In 1767 Ramsay was appointed portrait-painter to the king and queen, which brought him an immense increase of employment, as portraits of their majesties were perpetually in demand for foreign courts, ambassadors, and public bodies at home. He was, therefore, obliged to engage no fewer than five assistants to forward his pictures, among whom was David Martin, the predecessor of Raeburn. In consequence of his enlightened and amusing conversation, he became a great favourite with their majesties, the queen being particularly pleased with him on account of his ability to converse in German, in which he had not a rival at court, save amongst her own domestics. The state nobles, and other public leaders of that time, were also fond of the conversation of Ramsay, who is said to have taken more pleasure in politics and literature than in his art, and wrote many pieces on controverted subjects, with the signature "Investigator," which were ultimately collected into a volume. He corresponded too with Voltaire and Rousseau, both of whom he visited when abroad; and his letters are said to have been elegant and witty. "Ramsay, in short," says Mr. A. Cunningham, "led the life of an elegant accomplished man of the world, and public favourite." He was frequently of Dr. Johnson's parties, who said of him, "You will not find a man in whose conversation there is more instruction, more information, and elegance, than in Ramsay's." He was noted in his own country for having, after the battle of Prestonpans, written an imitation of the song of Deborah in Scripture, which he put into the mouth of a Jacobite young lady of family, and which displayed considerable powers of satire; and in the *Edinburgh Annual Register* for 1813 will be found a burlesque on Horace's "Integer Vitæ," which shows such a dexterous union of the Latin rhythm with the English rhyme, as none but a man of a singular kind of genius could have effected.¹

In consequence of an accident which injured his arm, Ramsay retired from business about the year 1775. He then lived several years in Italy, amusing himself chiefly with literary pursuits. His health gradually sinking, he formed the wish to return to his native land; but the motion of the carriage brought on a slow fever by the way, and he died at Dover, August 10, 1784, in the seventy-first year of his age.

John Ramsay, the son of the painter, entered the army, and rose to the rank of major-general. His two daughters, Amelia and Charlotte, were respectively married to Sir Archibald Campbell of Inverness, and Colonel Malcolm of Ford Farm, Surrey.

RAMSAY, ANDREW MICHAEL, better known by the name of the Chevalier de Ramsay, was born in Ayre, 9th June, 1686. He was the son of a baker, who had acquired some property, and was able to give him a good education. From the school of his native burgh he was removed to the university of Edinburgh, where he became distinguished for his abilities and diligence. In consequence of the high reputation he had acquired, he was intrusted with the tuition of James, afterwards fourth Earl of Wemyss, and his brother David, Lord Elcho, the former of whom he attended at the university of St. Andrews.

¹ The following portraits by Mr. Ramsay, have, amongst others, been engraved:—King George III.; Queen Charlotte; Frederick Prince of Wales; Lord Chancellor Hardwicke; the Earl of Bute; Lord Duke of Argyle; the Earl of Bath; Sir Charles Pratt (Lord Camden); Thomas Burnet, judge of Common Pleas; Hugh Dalrymple (Lord Drummore); Dr. Alexander Munro, primus; David Hume; Archibald Duke of Argyle; President Forbes; Provost Coutts; Lady George Lennox; Lady Erskine; Allan Ramsay, the poet.

Of these youths the chevalier has left a pleasing notice, dated Isleworth, February 25, 1709: "I have nothing to interrupt me but an hour or two's attendance at night upon two of the most innocent, sweet, sprightly little boys I ever knew." Besides this notice of his pupils, we have in the same document a remarkable revelation respecting himself. That he was a young man full of literary enthusiasm, and haunted with day-dreams of immortality, the history of his after-life abundantly testifies; yet he professes here that all his "ambition was to be forgotten." Such a profession may reasonably be suspected in any man, for no one, in ordinary circumstances, can have the least reason to fear that he will be forgotten. In young men it may always be interpreted as meaning the very reverse of the expression, being neither more nor less than the extorted bitterness of a proud or a vain spirit, sickening and sinking under the prospect of accumulating difficulties or ultimate disappointment.

Before this time Ramsay had become unsettled in his religious principles. He now visited Holland, and took up his residence at Leyden, the university of which was at that time the common resort of the literary youth of Scotland. Here he fell into the company of Poiret, one of the most distinguished advocates of the mystic theology then so prevalent on the Continent, from whom he learned the leading dogmas of that system. Having heard of the fame of Fénelon, Archbishop of Cambray, and that he had long advocated mysticism, Ramsay determined to pay him a visit and take his advice on the subject. He accordingly, in 1710, repaired to Cambray, where he met with the most cordial reception. He was at this time in his twenty-fourth year, polite and engaging in his manners, and of a gentle and easy temper, every way calculated to win upon the affections of a man like Fénelon. Having received him into his house as an inmate of the family, the good archbishop listened to the disjointed history of his religious opinions with patience, discussed with him at large his objections, his doubts, and his difficulties, and in less than six months had the satisfaction to find that he had succeeded in making his guest a true Catholic, at least as far as he could believe himself such, for Ramsay had most cordially imbibed all his opinions, philosophical, moral, and religious. This strange adventure gave colour and consistence to the whole subsequent life of the chevalier. Having been preceptor to the Duke of Burgundy, heir-apparent to the throne of France, Fénelon had considerable influence at the French court, and he procured for his disciple and protégé the preceptorship to the Duke de Chateau-Thierry and the Prince de Turenne. In this situation Ramsay acquitted himself so well that he was made a knight of the order of St. Lazarus, and from the commendations he received, was selected by the Pretender to superintend the education of his two sons, Prince Charles Edward, and Henry, afterwards Cardinal de York. For this purpose he left France, and repaired to Rome in the year 1724.

The retirement which Ramsay had previously courted and enjoyed was now interrupted. His literary status hindered him from keeping altogether aloof from the kindred spirits around him. Moreover, he perceived that the political and religious intrigues that were carried on at the apostolic court, but ill suited the prosecution of those literary labours in which he had embarked. He therefore, after a short residence in Italy, requested of his employer permission to return to France, which was readily granted. Literary leisure was what he now desired. In the capital of France, however, it was unlikely he

could obtain this, as the same intolerant spirit prevailed that had hastened his departure from Rome. He therefore resolved on visiting his native country. On reaching Britain he was received into the family of the Duke of Argyle. That repose so congenial to one of his studious habits was now afforded him, and he immediately set about the preparation of those works which he had long meditated, and through which he has become known to posterity. His largest work, *On the Principles of Natural and Revealed Religion*, contains a luminous and detailed statement of the various steps which the Divine Being, in the former of these grand divisions, has made demonstrable by human reason, and an ingenious exhibition of the latter as made known to man by revelation. The forcible process of deduction which, throughout the work, is brought to bear upon the mind of the reader, can hardly fail in accomplishing what the author intended—an elevation of the heart of the creature to the Creator. The work has passed several times through the press. Ramsay next published the *Travels of Cyrus*. The best criterion of judging of this publication is to be found in the great number of editions that have from time to time been laid before the public. Although the fame of the chevalier as a writer rests chiefly upon the *Travels of Cyrus*, yet on its first appearance it met with severe criticism. That a desire to be hypercritical might sway some of his literary judges is possible; at any rate, it has outlived their censorship. It secured for its author an honourable niche among the standard authors of Britain. It displays an intimate acquaintance with the customs, laws, learning, and antiquities of the period of which it treats, and exhibits a beautiful delineation of human character, together with the soundest principles of true philosophical discrimination. Soon after these works appeared he was honoured by the university of Oxford with the degree of Doctor of Laws, which was conferred on him by Dr. King, principal of St. Mary's Hall. It ought to have been previously stated, that, before receiving this honourable distinction, he had been admitted to St. Mary's Hall in 1730. He afterwards returned to France, and resided several years at Pontoise, a seat of the Prince de Turenne, Duke de Bouillon. While here, he published the life of his benefactor, the Archbishop of Cambray; a biographical sketch, chiefly remarkable as containing a detailed account of the persecution to which the worthy prelate was subjected by his brother divines, for his suspected connivance at the doctrines of mysticism, and the arguments adduced on both sides on his own conversion to the Catholic faith. It was reprinted in this country in a small duodecimo volume. Soon afterwards he published, in two volumes, the *History of Viscount Turenne, Marshal of France*, which was also translated and published in England. He resided in the prince's family in the situation of intendant till the period of his death, which happened at St. Germain-en-Laye, on the 6th of May, 1743, having nearly completed his fifty-seventh year. His remains were interred at the place where he died, but sometime afterwards his heart was removed to the nunnery of St. Sacrament at Paris.

It is supposed that when in England he did not visit the place of his birth. Perhaps his renunciation of the faith of his forefathers, and blighting the hopes of a doting parent, prevented his doing so. That he did not, however, neglect his relations is evident from the fact of his wishing to settle upon them an annuity, which they refused to accept. From France he remitted a considerable sum of money to his father: but on its being presented, the stanch Presbyterian indignantly replied, "It cam' by the beast,

and let it gang to the beast;" and it is not supposed that he ever profited in any manner by his son's abilities.

The principal works of the Chevalier Ramsay not yet alluded to are—a *Discourse on the Epic Poem*, in French, generally prefixed to the later editions of Telemachus; an *Essay on Civil Government*; *Remarks on Lord Shaftesbury's Characteristics* (French); a few English poems of no value; and two letters in French to Racine the younger, upon the true sentiments of Pope in the *Essay on Man*.

RAMSAY, JAMES ALEXANDER BROWN. See DALHOUSIE (MARQUIS OF).

RANDOLPH, THOMAS, Earl of Moray. This ancient Scottish paladin, who occupies so prominent a part in the wars of Robert Bruce, was sister's son of that great sovereign. He first appears among the adherents of good King Robert, when the latter commenced his desperate attempt to win the crown of Scotland, and make it worth wearing. In this way his name, as Thomas Randolph, knight of Strahdon, occurs in the list of that intrepid band who crowned his uncle at Scone; and in the disastrous skirmish soon after, near Methven, he was one of the prisoners who fell into the hands of the English. As the insurgent Scots were regarded as rebels against their liege-lord, Edward I., the usual laws of war were dispensed with; and thus, either with or without trial, the noblest and best of Scotland were consigned to the dungeon or the gallows. The worst of these alternatives would probably have been the fate of Randolph, in consequence of his near relationship to Bruce, had not the brave Adam de Gordon, who was a favourite with the English king, interceded in his behalf. Randolph's life in consequence was spared, but it was only on condition that he should swear fealty to Edward: and to this he submitted with that facility so characteristic of the knightly fidelity of the middle ages. He swore that he would be Edward's man, and the deadly enemy of all his enemies (including of course his own uncle and kindred), and thus was transformed in a trice from a Scottish patriot into a friend and servant of the oppressor. If anything can apologize for such tergiversation, it might be the difficulty of deciding at times with which party the right remained; and many may have thought, with Sir Roger de Coverly, that much might be said on both sides—especially when they had a gallows in view.

Randolph having thus changed his party, appears to have fought for it with a courage that did not belie his future renown. He was even among that band, headed by Aymer de Valence and John of Lorn, that chased Robert Bruce among the wilds of Galloway with blood-hounds, and nearly succeeded in capturing or slaying him. On this occasion Sir Thomas pursued the chase so eagerly, that he took his uncle's standard-bearer prisoner, along with the royal banner. But this unworthy alienation was not to continue much longer, and an event occurred by which Randolph was to be recovered to his country and his true fame. At this time Sir James Douglas, renowned far and wide by his terrible vengeance upon the English, who had garrisoned the castle of his fathers, was entrenched among the depths of Ettrick Forest, and making it good by prowess and stratagem against every assailant. This was a tempting adventure for Randolph, and accordingly, accompanied by Sir Alexander Stewart of Bonkill and Sir Adam Gordon—Anglicized Scots, like himself—he set off upon the enterprise, and encamped for the night at a solitary house on the Lyne-water, a tributary stream that falls into the Tweed a little above Peebles.

Douglas, however, whom no enemy ever caught asleep, happened to be in the neighbourhood; and on approaching the house he overheard some one within exclaiming "the devil!" with true military emphasis. Guessing from this token that the building was tenanted by stout soldiers, he made a sudden assault, scattered the surprised inmates, and captured Stewart and Randolph, whom he conducted to his master next morning. The meeting between the king and his renegade nephew was characteristic of such a party-changing period. "Nephew," said Bruce, "you have for a while renounced your faith, but now you must be reconciled to me." "You reproach me," answered the nephew sharply, "and yet better deserve to be reproached yourself; for since you made war against the King of England, you should have vindicated your right in the open field, and not by cowardly sleights and skirmishes." "That may hereafter fall out, and soon," replied the king—who had commenced in this very fashion, until misfortune taught him a wiser course of action; "meanwhile, since you have spoken so rudely, it is fitting that your proud words should receive due chastisement, until you learn to know the right, and bow to it as you ought." After this sage rebuke Randolph was sent into close and solitary confinement, to digest the lesson at leisure. How wisely such a punishment was inflicted, and how well it wrought, was attested not only in the future life of Randolph, but in the history of his country.

On being set at liberty, Randolph was not only restored to the king's favour, but invested with the earldom of Moray, which had large territories attached to it; and having set these in order, he repaired to that warfare in which he was to be surpassed by none except Bruce himself. It was now also, perhaps, that the generous rivalry commenced between him and his gallant captor Sir James Douglas, which continued to the end of their lives. This noble contention was now signalized by the "good Lord James" undertaking the siege of Roxburgh Castle, and Randolph that of Edinburgh, the two strongest fortresses in the kingdom, and still in possession of the English. The garrison in Edinburgh Castle was commanded by Sir Piers Leland, a knight of Gascony, but the soldiers having suspected him of holding communication with the Scottish king, deposed and imprisoned him, and set one of their own countrymen in his place, who was both wight and wise. While Randolph beleaguered the well-defended castle, tidings reached him that Douglas had succeeded at Roxburgh; and perceiving that force was useless, he resolved, like his rival in arms, to have recourse to stratagem. A favourable opportunity soon occurred. One of his soldiers, William Frank, had in his youth been wont to descend from the apparently inaccessible ramparts by a secret way in the rock, aided by a ladder of ropes, to visit a woman in the town with whom he intrigued; and he now offered to be the foremost man in conducting a party up the same path, which he still distinctly remembered. The proposal was accepted, and Randolph, with thirty followers, and Frank for his guide, commenced at midnight this dangerous escalade. With the aid of a rope-ladder they ascended in file, one man following another in silence, and by ways where a single false step might have precipitated the whole party to the bottom, or roused the sentinels above. They could even hear the footsteps of the guards going their rounds upon the ramparts. At this instant a stone came whizzing over their heads, with a cry from above, "Aha! I see you!" and they thought that all was over. "Now, help them, God," exclaims Barbour, at this point of the narrative, "for

in great peril are they!" But the sentry who had thrown the stone and uttered the cry, saw and suspected nothing, and was merely diverting his companions. After waiting till all was quiet, they resumed their desperate attempt, but had scarcely reached the top of the wall, Randolph being the third man who ascended, than the alarmed garrison rushed out upon them, and a desperate fight commenced. It fared, however, with the English as is the wont of such strange surprisals; they were confounded, driven together into a mass, and unfitted either for safe flight or effectual resistance. The result was, that the governor and several of his soldiers were slain, others threw themselves from the ramparts, and the rest surrendered.

While the report of this gallant deed was still circulating throughout the country, those events occurred that led to the battle of Bannockburn. At this great assize of arms, which seemed to be the last appeal of Scottish liberty previous to the final sentence, either for weal or woe, the arrangements which Bruce made for the trial were such a masterpiece of strategy as has seldom been equalled, even by the science of modern warfare. Among these dispositions the command of the left wing was intrusted to Randolph, with strict charge to prevent the English from throwing reinforcements into the castle of Stirling. Here, however, the cunning captor of Edinburgh Castle was about to be outwitted in turn, for 800 horsemen detached from the English army under the command of Sir Robert Clifford made a circuit by the low grounds to the east, and, unperceived by Randolph, whose post they had thus turned, were in full progress to the castle. The quick military eye of Bruce detected the movement, and riding up to the earl, he pointed to the detachment, and sharply exclaimed, "A rose has fallen from your chaplet!" Impatient to retrieve his lost honour, and recover the important pass, which was the key of the Scottish position, Randolph, at the head of 500 spearmen, hurried off with such speed, that he soon interposed his force between the enemy and the castle. The English thus interrupted, resolved to reach the castle by trampling down the little band with a single charge, and for this purpose came on with loosened rein. This contempt of foot-soldiers, which was common to the chivalry of the period, cost them dear, for Randolph, causing his men to place themselves in a ring back to back with their spears pointing outward, presented an impenetrable hedge to the enemy, through which they were unable to ride. Still the appearance of that charge, as seen from the Scottish army, was so terrible, and the little phalanx was so eclipsed by the throng of cavaliers that surrounded and seemed to tread it under foot, that Sir James Douglas could endure the sight no longer, and cried to the king, "Ah, sir! the Earl of Moray is in danger unless he is aided: with your leave, therefore, I will speed to his rescue." "No," replied the king, "you shall not stir a foot for him: whether he may win or lose, I cannot alter my plan of battle." But Douglas was not to be thus silenced. "I may not stand by," he impetuously exclaimed, "when I can bring him aid, and therefore, with your leave, I will assuredly help him or die with him!" Having exorted from the king a reluctant assent, he hastened to the aid of his rival; but before he could reach the spot he saw that the Scottish phalanx was still unbroken, while the English cavalry were reeling in disorder, and had already lost some of their bravest. On seeing this Douglas cried to his party, "Halt! our friends will soon be victorious without our help; let us not therefore lessen their glory by sharing it!" His prediction was accomplished, for Randolph and

his band so bestirred themselves, that the English were broken and chased off the field, while the earl, with the loss of only one yeoman, returned to his companions.

In the great battle that followed, by which the independence of Scotland was secured, the master-mind and towering form of the Bruce are so pre-eminent over every part of the field, that no room is left for meaner men. On this account we cannot discover the gallant Randolph amidst the dust and confusion of the strife, where he no doubt performed the office of a gallant man-at-arms, as well as a wise and prompt captain. He figures, indeed, in Barbour, where, as leader of the left wing, he resisted the shock of the English cavalry, in which the enemy chiefly rested their hopes, and kept his ground so gallantly, although his troops looked "as thai war plungyt in the se,"³ that—

"Quha sa had sene thaim that day,
I trow forsuht that thair suld say
That thair suld do thair deivour wele,
Swa that thair fayis suld it felle."

His name next appears in the parliament held at Ayr on the 26th of April, 1315, when an act was passed for the succession to the crown of Scotland. On this occasion it was ordained, that should the king or his brother, Edward Bruce, die during the minority of the heirs male of their bodies, "Thomas Randolph, Earl of Moray, should be guardian of the heir and of the kingdom, until the major part of the states should hold the heir fit to administer the government in his own person." In an important event that occurred only one month afterwards—the invasion of the Scots into Ireland, for the purpose of driving the English out of that island, and placing Edward Bruce upon its throne—Randolph was one of the principal leaders of the expedition, and, as such, was repeatedly employed in bringing over reinforcements from Scotland. Three years afterwards (1318), while Bruce was laying siege to Berwick, Spalding, one of the citizens, who had been harshly treated by the governor of Berwick, offered, by letter written to a Scottish nobleman, to betray upon a certain night the post upon which he was appointed to mount guard. This lord, unwilling to act in so important a matter upon his own responsibility, brought the letter to the king. "You did well," said Bruce, "that you revealed this to me, instead of to Randolph or to Douglas, for you would thus have offended the one whom you did not trust. Both of them, however, shall aid you in this adventure." The rival pair were accordingly enlisted for the purpose, and under their joint efforts the important town of Berwick was taken in a few hours.

The loss of Berwick was so disastrous to the English, as it furnished an open door to Scottish invasion, that they made every effort to recover it; and for this purpose laid siege to it in such force, and with a camp so well fortified, that to assail them would have been a perilous adventure. Bruce therefore resolved to withdraw them by an invasion of England, and for this purpose sent Randolph and Douglas, at the head of 15,000 soldiers, who penetrated through the west marches, wasted Yorkshire, and attempted to carry off the queen of Edward II., at that time residing near York, whom they meant to keep as a hostage for their retention of Berwick. But, unluckily for these heroes—and more unluckily by far for her husband, to whom her bondage would have been a blessing—the queen escaped when she was almost within their toils. A battle followed soon after, in which the English, under the command of the Archbishop of York, were routed at Mitton, near Boroughbridge, in the north riding of York-

shire, with great slaughter; and such was the number of priests who accompanied the standard of the archbishop, and fell on this occasion, that the Scots derisively termed it the "Chapter of Mitton." This event raised the siege of Berwick, and although the English army on its way homeward endeavoured to intercept the Scots, Randolph and Douglas eluded them, and returned in safety to Scotland. Another expedition into England, in which the pair were engaged under the leading of Bruce himself, occurred in 1322, or three years after the victory at Mitton. On this occasion the Scots almost succeeded, by a forced march, in capturing Edward II. himself, at the monastery of Biland, in Yorkshire; and although he escaped with difficulty to York, it was after leaving all his baggage and treasure in the hands of the pursuers. During this campaign Bruce resolved to attack the English camp, which was so completely fortified that it could only be reached, as was supposed, by a narrow pass. This pass Douglas undertook to force, and Randolph generously left his own command to serve as volunteer under him. The English gallantly defended this entrance to the camp; but while their attention was thus wholly occupied, Bruce, who was skilled in mountain warfare, turned their position in the rear by a body of Highlanders and Islesmen, who scaled the precipices, and unexpectedly came down upon the English while they were fully occupied with Randolph and Douglas in front.

The Earl of Moray was now to combat the enemy upon a new field of battle, and with very different weapons, in the capacity of envoy to the court of Rome, by which his sovereign had been excommunicated for the murder of Comyn, and where envoys from England were busily employed in stirring up the pontiff against the Scots. It was a strange match, where an illiterate soldier had to confront a conclave—a blunt straightforward Scot to wage a controversy with Italian cunning and finesse—and it was a still stranger result that the ultramontane, the barbarian, the man of Thule, should have had the best of it. Perhaps the College of Cardinals thought it impossible that such a person could know anything of the "trick of fence" in a political conflict, and therefore did not think it worth while to "lie at their old ward." Be that as it may, Randolph managed the negotiation so wisely and dexterously, that in spite of the evil odour under which his master's reputation suffered at the Papal court, and in spite of the intervention of wealthy, powerful England—compared with which the interests of Scotland were of little price at Rome—the pope accorded to Bruce a temporary absolution, by refusing the request of his enemies to ratify and publish in due form the sentence of excommunication—accorded to the Scots the right of electing their own bishops, although they had been accused of despising the authority of the church, slaughtering ecclesiastics, and subjecting them to capital trial and punishment, and showing, on not a few occasions, a strong leaning towards heresy—and gave Bruce himself the title of KING, thus recognizing his right to rule as a legitimate sovereign, notwithstanding his ecclesiastical offences, the claims of the house of Comyn to the Scottish throne, and the still more formidable pretensions of Edward II. himself, as lord paramount of Scotland. After having suffered these concessions to be extracted from him, the pope seems to have been astonished at his own facility; and he wrote accordingly to the King of England an apologetic letter, in which he fully stated the inducements presented to him by the Scottish envoy. This missive is a most incontestable proof of the sagacity of

Randolph, and shows that he was as fitted to excel in diplomacy as in war.

After having accomplished the emancipation of Scotland, the great work for which he had lived, and toiled, and suffered, Robert Bruce, prematurely worn out by his heroic exertions, and languishing under an incurable disease, retired to a castle on the banks of the Clyde, to spend in peace the few days that might be allotted him, and prepare for his departure. Still it was necessary, for the purpose of securing the advantages he had already won, to continue the war against England, until the independence of his country was fully recognized by the latter. This was the more necessary as Edward III. had now succeeded to the English throne, and although only sixteen years old, was already impatient to win his spurs, and giving promise that he might become as formidable a foe to Scotland as his grandfather Edward I. had been. Bruce therefore, from his sick-bed, dictated the plan of a formidable invasion into England, and intrusted the management of it to Randolph and Douglas, upon whose fitness for the undertaking he could now confidently rely, for hitherto they had been his right and left arms during the course of the eventful war. Seldom, indeed, have two military rivals been so completely at one in their joint undertakings, so that what the wisdom of the one could plan, the daring courage of the other was fully ready to execute. In this respect Randolph, who was the chief leader of the enterprise, appears to have wonderfully changed from that fiery young knight of Strahdon, who joined in the hot chase against his uncle in the wilds of Galloway, and afterwards, when taken prisoner, had reproached him to his beard for having recourse to delays and stratagems, instead of hazarding all upon an open field. His wisdom was as conspicuous through the whole of this singular campaign as the daring valour and chivalrous deeds of the Douglas. Into the particulars of the campaign itself we do not enter, as these have been fully detailed in another part of this work.¹ After the pair had wrought fearful havoc, defied the whole chivalry of England, and shifted their ground so rapidly that they could not be overtaken, or entrenched themselves so skillfully that they could not be attacked, they returned to Scotland unmolested, and laden with plunder. The blow they had dealt on this occasion was so heavy, that England, wearied with the disastrous strife, succumbed to a treaty of peace, which was ratified in a parliament held at Northampton in April, 1328. The conditions were glorious to Scotland, for by these the independence of the kingdom was recognized, and all the advantages that Edward I. had won with so much toil and expense, were renounced and relinquished; and, if not honourable, they were absolutely necessary for England, whose treasures were exhausted and her people dispirited by defeat, while her councils, controlled by a profligate queen and her minion, promised to end in nothing but ruin and shame.

Only a year after this event, by which Bruce's utmost hopes were realized, he breathed his last at Cardross, surrounded by the faithful warriors who had partaken of his victories as well as his trials and cares. His dying testament, which he gave on this occasion, for the future protection of the kingdom, as well as the commission which he intrusted to the "good Lord James," to carry his heart to the holy sepulchre, are matters familiar to every reader of Scottish history. By the act of settlement passed in 1315, Thomas Randolph, Earl of Moray, became regent of the kingdom during the minority of his young cousin David II.

¹ See SIR JAMES DOUGLAS, vol. i. p. 462.

On entering upon the duties of the regency the Earl of Moray showed himself not only an able but a strict and stern justiciary. In such a situation, indeed, severity to the criminal was true clemency to society at large, in consequence of the wild insecurity which so protracted a warfare had occasioned. The strictness with which he enforced the laws gives us not only a strange picture of the state of society in general, but the nature of Scottish legislation since the days of Malcolm Canmore. Minstrels and players, who often made their profession a cover for every kind of license, he prohibited from wandering about the country under severe penalties. If any one assaulted a traveller, or any public officer while in the discharge of his duty, he made it lawful for any man to kill the offender. To prevent robberies and promote a feeling of security among the industrious, he made a law that the countrymen should leave their iron tools and plough-gear in the field, and that they should not shut their houses nor stalls at night. If anything was stolen, the loss was to be repaired by the sheriff of the county, and the sheriff was to be reimbursed by the king; and the king was to be indemnified out of the goods of the robbers when they were taken. To insure the due execution of the laws, he also held justice-aïres, travelling for this purpose over the whole country; and while his sentences were severe, and often measured by the mere purpose of the criminal, whether it had succeeded or not, prompt execution was certain to follow. Thus, at a justice-court which he held at Wigton, a man complained at his tribunal that an ambush was placed in a neighbouring wood for the purpose of murdering him, but that happily he escaped it, and now claimed protection. Randolph immediately sent to the place, where the men in ambush were arrested, and had them forthwith executed, as if they had committed the murder. On another occasion he showed an instance of boldness in vindicating the claims of natural justice in defiance of ecclesiastical immunities, upon which few in England, or even in Europe, whether magistrate or king, would have dared to venture. A man having slain a priest, had subsequently passed over to Rome, where, after confession of his offence and full performance of penance, he received clerical absolution. Being thus, as he thought, *rectus in curia*, he ventured back to Scotland, as if every penalty had been liquidated, and, in an evil hour for himself, ventured into the presence of Randolph while the latter was holding a justice-court at Inverness. The quick eye of the earl detected the culprit, who was immediately arrested, and placed on trial for the murder. The man pleaded that the person he had slain was a priest, not a layman; and that for this he had received the absolution of the church, whose subject the priest was. But this was not enough for Randolph: the priest, he said, was a Scottish subject and king's liege-man, irrespective of his clerical office; and therefore, as the murderer of a Scottish subject, the culprit was adjudged to suffer death.

Although a perpetual peace had been ratified between Scotland and England, the injuries each country had received were too recent, and the claims for compensation were too numerous, to give hope that it would be lasting. Scarcely, therefore, had Randolph held the regency for three years, when certain English nobles, who were disappointed in the recovery of their Scottish estates, adopted the cause of Baliol as their pretext for breaking the treaty of Northampton, and made formidable preparations to invade Scotland by sea. In consequence of this intelligence, Randolph assembled an army and marched to Colbrandspath, expecting the invasion
